medications, pulmonary outcomes assessed with repeated pulmonary function tests (PFTs) and chest HRCT and complications in a 1-year follow-up period were documented for each patient. Univariate models were performed in order to identify determinants of infection and clinically significant difference in PFTs (defined as change of ≥ 10% in FVC and/or ≥ 15% in DLCO).

Results: The mean age at the time of IPAF diagnosis was 63.2 (±11) years and 62% of the patients were female. The most common clinical features included in the IPAF criteria were arthritis (82%) and Raynaud's phenomenon (26%). A morbilliform and/or polymorphic rash of the face, neck and extremities (not included in the IPAF criteria) was noted in 54% of patients. ANA (59%) and anti–Ro (21%) were the most common auto-antibodies. Non-specific Interstitial Pneumonia (NSIP) was the most prevalent radiological pattern (61.5%) as shown in table 1. Treatment comprised corticosteroids and immunosuppressants including hydroxychloroquine, methotrexate, azathioprine, mycophenolate and cyclophosphamide. PFTs following treatment at 6 and 12 months from baseline showed a trend of improvement (Table 2, p> 0.05). At 1 year from baseline, 20.5% of patients showed a clinically significant deterioration while 25% had a clinically significant improvement. Infections were observed in 23.1% of patients during the first semester and in 12.8% during the second semester of the follow-up period. All were respiratory tract infections and two patients (5.1%) required hospitalization. All infections occurred in patients with non-UIP pattern (p=0.02) which might be attributed to higher doses of corticosteroids used in these patients (mean initial prednisolone dose = 27 (±18) mg/d in patients with non-UIP pattern versus 17 (±16) mg/d in patients with UIP pattern, p=0.4).

Table 1. Prevalence of HRCT patterns in 39 patients.

Radiological pattern	No (%)
NSIP	24 (61,5%)
OP	2 (5,1%)
NSIP with OP overlap	2 (5,1%)
LIP	1 (2,6%)
UIP	7 (18%)
NSIP and UIP	3 (7,7%)

NSIP: Non-specific Interstitial Pneumonia, OP: Organizing Pneumonia, LIP: Lymphocytic Interstitial Pneumonia, UIP: Usual Interstitial Pneumonia.

Table 2. PFTs at baseline, 6 and 12 months.

PFTs (% of predicted value ± SD)	Baseline	6 months	12 months	P value
FVC	79% (±19%)	82% (±18%)	84% (±17%)	ns
DLCO	49% (±16%)	52% (±17%)	53% (±17%)	ns

Conclusion: Rash is a common feature in IPAF and may be considered for inclusion into IPAF criteria. A trend of improvement in PFTs and a significant risk of respiratory tract infections mainly in the first semester of treatment and in patients with non-UIP radiological pattern were observed. Larger prospective studies are warranted in order to elucidate IPAF's prognosis and to identify effective management approaches.

AB1217 THE EFFECT OF PROPHYLACTIC DOSE OF TRIMETHOPRIM-SULFAMETHOXAZOLE ON SERUM CREATININE IN JAPANESE PATIENTS WITH CONNECTIVE TISSUE DISEASES

R. Kawato[1], R. Rokutanda[2], M. Okada[3]. [1]*Juntendo University Graduate School of Medicine, Department of Rheumatology, Tokyo, Japan*; [2]*Kameda Medical Center, Department of Rheumatology, Chiba, Japan*; [3]*St. Luke's International Hospital, Immuno-Rheumatology Center, Tokyo, Japan*

Background: Trimethoprim-sulfamethoxazole (TMP/SMX) is an effective antibiotic for prevention of pneumocystis pneumonia (PCP) in immunocompromised patients with various connective tissue diseases (CTD). [1)] At the normal dose of TMP/SMX, trimethoprim (TMP) component inhibits tubular creatinine secretion, leading to a rapid, but ultimately reversible, increase in serum creatinine. [2)] However, at prophylactic dose, the effect of TMP/SMX on creatinine in patients with CTD is not clear.

Objectives: We conducted this study to evaluate the effect of prophylactic dose of TMP/SMX on serum creatinine in patients with CTD.

Methods: This was a retrospective cohort study in which all patients with CTD, treated with prophylactic dose of TMP/SMX during the period between 2004 and 2018, were included, while patients with acute kidney injury due to other causes, were excluded. Retrospective medical chart review was performed to collect the following data, from the baseline through 12 weeks: baseline patient characteristics, serum creatinine (SCr), creatinine clearance (CCr), urine test, serum electrolytes, and level of SCr elevation after initiation of prophylactic dose of TMP/SMX from baseline, within 12 weeks. Using single and multiple regression analyses, we explored the risk factors that affected the SCr elevation value.

Results: A total of 272 patients, comprising 186 females, at an average age of 56±18 years, were included in the present study. Based on the medical chart review, this cohort was scored under the following categories: rheumatoid arthritis (RA) n=78, systemic lupus erythematosus (SLE) n=76, Vasculitis n=39, polymyalgia rheumatica/ giant cell arteritis (PMR/GCA) n=29, systemic sclerosis (SSc) n=32, polymyositis/dermatomyositis (PM/DM) n=10, mixed CTD (MCTD) n=5, and others n=56. Their average baseline creatinine level before treatment was 0.67 ± 0.25 mg/dL. They were administered with a mean dose of TMP comprising 99.2 ± 34.4 mg/day, which elevated the mean SCr level by 0.07 ± 0.12 mg/dL. Approximately 85% of the patients continued with the TMP/SMX treatment for 12 weeks, and only 5 (2%) showed creatinine elevation by more than 0.3 mg/dL. They were also administered with prednisolone at an average dose of 36.9 ± 92.3 mg/day.

For multiple regression analyses, the following variables were included: age, baseline CCr, use of loop diuretics, use of spironolactone, dose of TMP/SMX, use of non-steroidal anti-inflammatory drugs, and past history of diabetes mellitus. Baseline CCr and advanced age were independent risk factors. Regression coefficients and p values for age and CCr were 0.0018 (95% CI; 0.00083 – 0.0027) and p=0.00028; and 0.0007 (95% CI; 0.0003 – 0.0010) and p=0.00038, respectively.

Conclusion: In this study, we demonstrated that prophylactic dose of TMP/SMX elevates SCr by 0.07 ± 0.12 mg/dL on an average. Prophylactic dose of TMP/SMX rarely elevated the creatinine level significantly. Thus, based on our findings, other causes of renal impairment may be considered, if the patients administered with low-dose TMP/SMX show creatinine elevation by more than 0.3 mg/dL.

AB1218 MATERNAL-FETAL MORBIDITY AND MORTALITY AMONG PREGNANT PATIENTS WITH RHEUMATIC DISEASES IN THE CLINIC OF PREGNANCY AND ARTHRITIS OF THE SALVADORAN SOCIAL SECURITY INSTITUTE

R. I. López[1], R. Montufar[1], D. Alpizar-Rodriguez[2]. [1]*Instituto Salvadoreño del Seguro Social, San Salvador, El Salvador*; [2]*Colegio Mexicano de Reumatología, Ciudad de México, Mexico*

Background: Connective tissue diseases are more frequent among women in childbearing age. In the past, it was not recommended for these women to get pregnant because of the risk of adverse pregnancy outcomes.

Objectives: The aim of this study is to compare the morbidity and mortality between pregnant patients with rheumatic diseases and pregnant patients without rheumatic diseases in El Salvador.

Methods: A case control study was conducted at *the Clinic of Pregnancy and Arthritis* and the *1° de Mayo Hospital*, both centers belong to the *Salvadoran Social Security Institute*. Clinical files were reviewed retrospectively and some of the data were collected during the clinical visit to each center. We included pregnant patients with rheumatic diseases of the Clinic of Pregnancy and Arthritis; the control group was randomly selected with a ratio 1:1 within pregnant patients without rheumatic diseases of the 1° de Mayo Hospital, between January 2016 and June 2019. A complication was defined as any event that required hospital admission. We used logistic regression to analyze univariable and multivariable associations to compare pregnancy outcomes between groups.

Results: During the study period, 230 patients were randomly included in both, the study group and the control group, with a ratio 1:1. The mean age for the study group was 32 (27-35) years, which was relatively older than the control

group, 28 (24-32) years. The mean pregnancy among both groups was 2 per patient. The most common rheumatic diseases in the study group were Rheumatoid arthritis (39.1%), Antiphospholipid Syndrome (31.3%) and Generalized Lupus Erythematosus (20%). The average visit to the Rheumatologist during pregnancy in the study group was 3.2. The visits started at a mean of 15.2 + 7.6 weeks of gestational age.

Thirty three point nine percent (33.9%) of the study group presented complications during pregnancy (vs 20.9%). Among the patients who presented complications, 9 of them (7.8%) had more than one complication during pregnancy. There were 44.3% cesarean deliveries in the study group compared with 22.6% in the control group, OR 2.1 (1.5-4.8) p=0.001. There were 16% of preterm deliveries between 34-37 weeks of gestational age in the study group compared to 10% in the control group, OR 2.2 (0.9-4.8) p=0.063. Preterm deliveries before 34 weeks of gestational age in the study group were 18% compared to 3% in the control group, OR 6.9 (2.3-20-9) p=0.001. There were 6 cases of spontaneous abortion in the study group and none in the control group. Thirty four percent (34%) of cases with low birth weight (<2.5kg) were found in the study group compared to 14% in the control group, OR 3.4 (1.6-6.1) p=0.001.

Conclusion: The most common rheumatic diseases among pregnant patients were Rheumatoid Arthritis, Antiphospholipid syndrome and Generalized Lupus Erythematosus.

Having a rheumatic disease was more associated with cesarean delivery, preterm delivery between 34 and 37 weeks of gestational age, and low birth weight.

AB1219 ADHERENCE TO THE MEDITERRANEAN DIET IN PATIENTS WITH RHEUMATOID ARTHRITIS AND OSTEOARTHRITIS, MULTICENTER STUDY

I. Morales-Ivorra[1], D. Grados Canovas[1], A. Rozadilla[2], J. M. Nolla[2], B. Busque[1], J. Bové[1], D. Madrid[1], L. Valencia Muntalà[2], M. Romera-Baurés[2]. *[1]Hospital Igualada, Igualada, Spain*; *[2]Hospital Universitari de Bellvitge, Hospitalet de Llobregat, Spain*

Background: The Mediterranean diet (MD) has proven beneficial in a large number of chronic diseases. The relationship between the MD and rheumatic diseases is complex and there are few studies that have studied this relationship. These show that there could be a positive association between adherence to the Mediterranean diet (MD-A) and a lower prevalence of OA. In the case of RA, it has been proposed that the MD could reduce pain and improve functionality.

Objectives: To determine the MD-A diet of patients with RA and OA, and compare it with that of healthy subjects.

Methods: Multicenter, cross-sectional, observational study. Patients who attend the rheumatology outpatient and meet the ACR / EULAR 2010 criteria for RA and ACR for OA of hands, knees or hips are included in the study. The healthy are recruited among health personnel and companions of patients who do not live in the same address as the patient. The study is being carried out in the rheumatology consultations of two Hospitals and an outpatient center with specialized care. All participants have answered a survey of 14 questions (MEDAS-14), based on the Predimed study, which assesses MD-A. Fisher's exact test and the Mann-Whitney U test have been used to assess statistical significance. The study was approved by the Clinical Ethics and Research Committee of the centers.

Results: There have been 279 surveys (132 RA, 82 OA and 65 healthy). The MD-A in patients with RA is lower than in healthy (6.26 vs. 7.15, p <0.05). Patients with OA also have less adherence to the MD than healthy ones but this difference is not statistically significant (6.85 vs. 7.15, p> 0.05). The proportion of patients with RA and OA who consume 2 or more servings of vegetables daily is lower than that of healthy subjects (RA 20%; OA 13% and healthy 34%, p <0.05). The proportion of RA and OA that eats more than 3 weekly servings of nuts compared to healthy is also lower (RA 21%, OA 17%, healthy 35% p <0.05). The proportion of RA and OA that consume less than 1 serving of butter is lower than that of healthy (RA 86%; OA 82% and 98%, p <0.05). The proportion of RA that consumes 3 or more servings of legumes per week is lower than healthy (23% vs 40%, p <0.05). These differences between the OA group and healthy are not appreciated. The consumption of more than three pieces of fruit daily is more frequent in OA than in healthy ones (45% vs 26%, p <0.05).

Conclusion: The MD-A diet quantified by MEDAS-14 in subjects with RA and OA is lower than in healthy subjects, being significant in RA. Patients with RA and OA eat less vegetables and nuts but the intake of butter is higher. The RA group consumes less legumes than healthy ones. Patients with OA eat more fruit than healthy ones, this is the only food in the MD valued by MEDAS-14 that is consumed in a lower proportion in healthy ones. Longitudinal intervention studies are necessary to assess whether the differences observed in this study have any causal relationship.

AB1220 DO ANTIBODIES HAVE DIFFERENTIAL EFFECT ON RADIOGRAPHIC PROGRESSION IN RA?

A. Minocha[1], S. Kukran[1], P. Yee[1], M. K. Nisar[1]. *[1]Luton and Dunstable University Hospital, Luton, United Kingdom*

Background: The presence of bony erosions in patients with RA is a marker of disease severity and once present they are largely irreversible. Previous studies have shown that those who are RF positive have more erosions than those who are RF negative. Likewise, ACPA is associated with increased bone loss and rapid erosive changes.

Objectives: The aim of our study was to determine which of these two antibodies is more strongly associated with erosive disease and whether being double +ve confers higher risk than single positive antibody status.

Methods: A retrospective study of 774 patients diagnosed with RA at a large university teaching hospital during the period of January 1981 and December 2018. Clinical records were reviewed to determine antibody status, date of diagnosis, duration of symptoms, DAS-28, age, ethnicity and whether the 1987 Rheumatoid Arthritis criteria was met. The presence of radiographic erosions at diagnosis were determined from reports of plain film radiographs of hands and feet of all patients. Chi square model was utilised to ascertain if there was a significant relationship among the four groups. Mann Whitney two-tailed U test was employed to determine the significance of relationship between the double negative group and other arms for all variables including disease duration and delta change in DAS28. Significance level was predefined at 0.05.

Results: All patients fulfilled the 2010 ACR/EULAR criteria. 240 (31%) patients were male and 534 (69%) were female with an age range of 17 to 90 years for the cohort. The duration of symptoms ranged for the patient cohort from 0.5 to 250 months with a median of 6 months while the duration of disease ranged from 4 to 455 months with a median of 49 months. DAS 28 ranged from 1.19 to 8.4 with a median of 4.4. 367 (47%) were positive for both RF and ACPAs, 87 (11%) were positive for RF alone, 66 (9%) were positive for ACPA alone and 254 (33%) were antibody negative.

There were a total of 127 patients with erosions at the time of diagnosis. Patients in the double positive group had a significantly higher (p=0.003) erosion burden compared to the double negative group i.e. 21.5% in RF+/ACPA+ versus 11.0% in RF-/ACPA- group. The erosion burdens in RF+/ACPA- and RF-/ACPA+ groups were 13.7% and 12.1% respectively.

Conclusion: This is the first real world study to demonstrate the radiographic erosive burden in the RA cohort with respect to RF/ACPA status. Our results show that patients RF+/ACPA+ have nearly two-fold higher incidence of radiographic erosions than patients who are RF-/ACPA-. Patients with single antibody positivity have a trend towards higher erosive burden compared to the double antibody negative group however it's the combination of two antibodies which is strongly associated with erosive disease.

AB1221 POPULATION WIDE STUDY OF MORTALITY IN ANCA-ASSOCIATED VASCULITIS IN WESTERN AUSTRALIA FROM 2000 TO 2014

W. Taylor[1], W. Raymond[1], H. Keen[2,3], C. Inderjeeth[3,4], D. Preen[5], J. " Nossent[4,6]. *[1]University of Western Australia, Rheumatology Section, School of Medicine, Crawley, Australia*; *[2]Fiona Stanley Hospital, Rheumatology, Murdoch, Australia*; *[3]The University of Western Australia, Rheumatology Section, School of*

Medicine, Crawley, Australia; [4]*Sir Charles Gairdner Hospital, Rheumatology, Nedlands, Australia*; [5]*The University of Western Australia, School of Population and Global Health, Crawley, Australia*; [3]*The University of Western Australia, Rheumatology Section, School of Medicine, Crawley, Australia*

Background: Survival in ANCA-associated vasculitis (AAV) has improved substantially in the last fifty years, but Australian data and studies with a control population are scarce.

Objectives: The aim of this study was to compare the all-cause mortality rate between patients with AAV and matched controls in Western Australia.

Methods: A retrospective population-based cohort study conducted using the Western Australia Health Data Linkage System (WADLS) for patients with a diagnostic code for AAV (International Classification of Diseases (ICD)-10-AM M30.1, M31.3 and M31.7). We included 240 patients with AAV (mean age 57.37 ± 16.69, 48.8% males) who had a hospital admission or emergency department visit between 1 January 2000 and 31 December 2014 and 4406 controls matched for age and sex. Death details were obtained from the WA Death registry. Mortality rates per 1000 person-years (MR) for AAV patients and controls were compared by mortality rate ratios (MRRs) with 95% CI. Kaplan Meijer survival estimates were analyzed by log-rank test.

Results: During a mean follow-up of 6.58 years (3.37, 11.25) 83 incident AAV patients (34.6%) died, giving a mortality rate of 48.13 per 1000 person-years (95% CI 38.33, 59.66). This was 82% higher overall than in controls (MRR 1.82, 95% CI 1.46, 2.26, P < 0.0001), while the MRR for males with AAV was 2.28 (95% CI 1.46, 2.26; P < 0.0001) and for females 1.43 (95% CI 1.01, 2.02; P = 0.0267). Survival estimates at one (90.5%) and five years (75%) were significantly lower in AAV patients than controls.

Conclusion: Over the last fifteen years, the mortality risk for AAV patients remains significantly increased compared with matched controls and more so for male than female AAV patients. Together with the reduced one- and five-year survival rate, this indicates the need for further improvements in initial disease management in order to reduce the risk of death in AAV.

Table Mortality rates (MR) per 100 patient years and Mortality rate ratio (MRR) with 95% CI in patients with AAV and controls

	AAV			Control			
	Deaths	Person years	MR (95% CI)	Deaths	Person years	MR (95% CI)	MRR (95% CI)
All	83	1724	48.1 (38.3, 59.6)	1219	46069	26.4 (25.0, 27.9)	1.82 (1.46, 2.26)
Male	49	789	62.1 (45.9 82.0)	690	25295	28.2 (25.2, 29.3)	2.28 (1.72, 3.02)
Female	34	935	36.3 (25.1, 50.7)	529	20773	25.4 (23.3, 27.7)	1.43 (1.01, 2.02)

AB1222 HOW DOES CHANGING THE TRADITIONAL P VALUE SIGNIFICANCE THRESHOLD TO .005 EFFECT OBSERVATIONAL STUDIES?

M. Oztas[1], Z. Toker Dincer[1], H. Yazici[2]. [1]*Istanbul University-Cerrahpasa, Department of Medicine, Division of Rheumatology, Istanbul, Turkey*; [2]*Academic Hospital, Istanbul, Turkey*

Background: Changing the traditional p value significance level from 0.05 to 0.005 has been proposed as one remedy to the common ill understanding and use of the p values (1-2) especially leading to poor reproducibility. It was then reported that this change would decrease the number of statistically significant primary end points in randomized controlled trials (RCT) reported during 2017 in 3 main general medical journals by 1/3 (3).

Objectives: We reasoned that the same change would affect in the right direction the significance conclusions more in observational studies (OS) in that OS generally have retrospective or cross-sectional designs, looser study inclusion criteria, many potential confounders and post – hoc analyses.

Methods: We surveyed how the 0.05 to 0.005 change would affect the OS in the same 3 journals in reference 3 for the same year (2017) and in another year (2002), included to better assess the validity of our findings. RCT were also surveyed for both time periods. Two authors (MO, ZTD) surveyed all studies. Disagreements were settled by HY. Differing from the previous study (3) we analyzed the p values as related to the primary end points only in the abstracts. The RCT and OS between January 1, 2002 – December 31, 2002 and January 1, 2017 -December 31, 2017 in N Engl J Med, Lancet and JAMA were included.

Results: Among the RCT in 2017 the decrease in the number of significant p values was quite similar between what was reported (3) and the current study (Table) (29.3 vs 30.0%) supporting the validity of the slightly different methodology we used. We were however surprised to see that changing the significance level to 0.005 did not decrease the number of significant p values in OS as compared to the RCT. In fact the percentage decrease in RCT was statistically significantly less in 2002 and numerically in 2017 (Table).

Table. OS and RCT in 2002 and 2017

	OS (2002)		RCT (2002)
Number of articles	305		211
Total number of p values related to primary outcome(s)	323		322
p<0.05 n(%)	260(80.4)		240(74.5)
p<0.005 n(%)	190(58.8)		121(37.5)
Reduction in significant number of p values* (%)	70(26.9)	**P=0.011**	119(49.5)
	OS (2017)		**RTC (2017)**
Number of articles	167		200
Total number of p values related to primary outcome(s)	187		257
p<0.05 n (%)	162 (86.6)		173(67.3)
p<0.005 n (%)	125(66.8%)		121(47.0%)
Reduction in significant number of p values* (%)	37(22.8)	**P=0.55**	52(30.0)

RCT:Randomized Controlled Trials
OS: Observational Studies
*Number of p values <0.05 -Number of p values<0.005/(Number of p values<0.05

Conclusion: Contrary to our initial reasoning we now realize that changing the traditional p threshold will not decrease the number of significant p values more in OS than in RCT. A limitation of our work was that we surveyed only 3, high impact factor, general medicine journals. We envisage that in studies with smaller sample sizes more commonly published in journals with lower impact factors, the proposed change in the significance threshold would be more useful. Smaller sample sizes lead to more unstable, fickle p (4) values and changing the threshold would conceivably more or less stabilize this fickleness both in OS and RCT.

AB1223 RHEUMATOID ARTHRITIS PATIENTS INCLUDED IN GLUCOCORTICOID TRIALS MOSTLY RESEMBLE THOSE SEEN IN OBSERVATIONAL COHORTS: A SYSTEMATIC REVIEW AND META-ANALYSIS

A. Palmowski[1], S. M. Nielsen[2], T. Buttgereit[1], Y. Palmowski[1], M. Boers[3], R. Christensen[2], F. Buttgereit[1]. *[1]Charité - Universitätsmedizin Berlin, Berlin, Germany*; *[2]Musculoskeletal Statistics Unit,The Parker Institute, Bispebjerg and Frederiksberg Hospital, University of Copenhagen and Research Unit of Rheumatology, Department of Clinical Research, University of Southern Denmark, Odense University Hospital, Frederiksberg and Odense, Denmark*; *[3]Department of Epidemiology and Biostatistics, and Amsterdam Rheumatology and Immunology Center, Amsterdam UMC, Vrije Universiteit Amsterdam, Amsterdam, Netherlands*

Background: Randomised controlled trials (RCTs) are considered the gold standard in clinical research. Their results, however, may not be generalizable to patients in routine care.[1] Together with methotrexate, glucocorticoids (GCs) constitute the mainstay of therapy for many patients with rheumatoid arthritis (RA), but it is unclear whether trial evidence is actually generalizable to real-world patients.
Objectives: This review assesses to what extent RA patients participating in GC-RCTs differ from RA patients taking GCs in routine care.
Methods: This study was registered with PROSPERO (CRD42019134675). MEDLINE was searched for RCTs and, as comparators, cohort studies in RA evaluating systemic GC therapy. Cohorts were not allowed to exhibit apparent selection mechanisms concerning gender or age. Random-effects meta-analyses combined descriptive baseline characteristics that may modify the benefit-risk-ratio of various RA therapeutics. Meta-analyses were stratified by study type (RCT and CS). Stratified estimates were subsequently compared.
Results: 55 RCTs and ten cohort studies (21,657 participants overall) were included. Twelve characteristics (related to general demographics and disease activity) were reported frequently enough to allow for comparative analysis. Compared to cohorts, RCT participants were younger (-4.7 [-7.2 to -2.1] years) and had somewhat higher erythrocyte sedimentation rates (12 [6 to 18] mm/h) (Table 1). In the other ten characteristics, estimates did not differ significantly. Numerically, cohort patients had more longstanding disease and slightly more favourable disease levels in core set variables. Comorbidities could not be assessed.

Table 1. Pooled estimates

Outcome	RCT	*k*	Cohort	*k*	Contrast	(95% CI)	*p*
General demographics							
Age (years)	54.2	50	58.9	10	–4.7	(–7.2 to –2.1)	<0.001
Female (proportion)	0.70	52	0.73	10	0.89	(0.68 to 1.16)	0.38
Current or previous smokers (proportion)	0.59	3	0.51	2	1.38	(0.61 to 3.14)	0.44
BMI (kg/m^2)	25.9	5	25.9	3	0.0	(–1.9 to 1.9)	0.98
Disease duration (months)	56.5	43	85.1	7	–28.6	(–85.6 to 28.4)	0.33
Disease activity							
ESR (mm/h)	40.1	31	28.2	3	11.8	(5.7 to 18.0)	<0.001
DAS	5.3	24	4.9	5	0.4	(–0.1 to 0.9)	0.12
RF+, (proportion)	0.67	32	0.63	6	1.19	(0.80 to 1.78)	0.39
ACPA+, (proportion)	0.64	7	0.56	3	1.38	(0.64 to 3.00)	0.41
HAQ	1.3	31	1.1	4	0.2	(–0.1 to 0.5)	0.15
Pain (0-10)	5.2	26	4.8	2	0.4	(–0.8 to 1.6)	0.52
Patient global assessment (0-10)	5.2	17	4.9	3	0.3	(–0.9 to 1.5)	0.58

Conclusion: The results of our study suggest that evidence from RA GC-RCTs can be generalized to most patients in routine practice. We note that comorbidities – a frequent exclusion criterion for trial participation – could not be evaluated due to insufficient reporting. Our findings contrast with a similar study on RCTs investigating biologics in RA: There, trial participants were found to differ significantly in 4 out of 8 investigated baseline characteristics.[2]

AB1224 MAJOR DEPRESSIVE DISORDER AMONG CYPRIOT PATIENTS WITH SYSTEMIC LUPUS ERYTHEMATOSUS AND CORRELATION WITH CLINICAL CHARACTERISTICS AND DISEASE-SPECIFIC HEALTH-RELATED QUALITY OF LIFE

K. Parperis[1,2], S. Psarelis[3], S. Symeonidou[3], M. Michaelides[4], D. Nikiforou[5], E. Antoniade[1], B. Bhattarai[2,6]. *[1]University of Cyprus Medical School, Nicosia, Cyprus*; *[2]The University of Arizona College of Medicine, Phoenix, United States of America*; *[3]Nicosia General Hospital, Strovolos, Cyprus*; *[4]Ygia Polyclinic Private Hospital, Limassol, Cyprus*; *[5]Limassol General Hospital, Kato Polemidia, Cyprus*; *[6]Valleywise Health Medical Center, Phoenix, United States of America*

Background: Major depressive disorder (MDD) is a common comorbidity in patients with chronic rheumatic conditions, and patients with systemic lupus erythematous (SLE) have an increased risk of developing depression. The coexistence of SLE and MDD might lead to impaired health-related quality of life (HRQOL). Gaining a deeper understanding of the factors associated with MDD in SLE will allow us to develop strategies in order to prevent depression and achieve an early diagnosis and management.
Objectives: The aim of this study is to determine the contributing factors associated with MDD in Cypriot SLE patients and examine the correlation between disease-specific HRQOL domains and depression.
Methods: We conducted a cross-sectional study of SLE patients who fulfilled the SLICC-2012 criteria. The patients were recruited from August 2019 to January 2020. Baseline demographic data, clinical features, and therapeutic regimens were captured. Depression was assessed by the patient health questionnaire (PHQ)-9, a validated tool to screen and diagnosed the condition. Scores above ≥10 are indicating MDD. HRQOL was evaluated by a disease-specific validated questionnaire, LupusQoL-Greek. LupusQol scores ranged between 0-100, with higher scores reflecting better QoL. The self-rated health status was examined, and the response was separate to poor/fair vs excellent/good. Demographic data, LupusQoL domains, clinical and other features of the SLE patients were described and compared between MDD (PHQ-9 ≥ 10) and non-MDD (PHQ-9<10) groups using Wilcoxon ranksum tests for continuous variables and chi-square tests for categorical variables.
Results: A total of 88 SLE patients were included in the study, with a mean age of 48.6 (19-80), 71(80%) were women, and mean disease duration of 13.2 years (0-44). Compared to the non-MDD group, patients with MDD (n=32, 36%) were significantly older (mean age 53.5 vs 46.9; p=0.03) and more likely to have the following SLE manifestations: mucocutaneous, vascular, pulmonary and musculoskeletal involvement. Furthermore, patients with MDD were less likely to be clinical quiescent (34.3%) compared with the non-MDD group (57.1%) (P<0.05). Self-rated health described as poor/fair was markedly associated with MDD (p<0.001). The LupusQoL domains' scores were notably lower in patients with MDD (PHQ ≥ 10), with a statistically significant reduction in all LupusQoL domains, indicating that depression was associated with worse HRQOL (Table 1).

Table 1. Differences in 8 LupusQoL domain scores among SLE patients with and without major MDD (PHQ-9 ≥10)

LupusQoL Domains (0-100)	PHQ-9 <10 (non-MDD)	PHQ-9 ≥10 (MDD)	P-value
Physical Health	72.87 (81.2, 9.3-100)	40.01 (32.75, 0-90.6)	<0.0001
Pain	75.27 (75, 16.6-100)	43.2 (41.6, 0-100)	<0.0001
Planning	81.08 (91.6, 0-100)	44.51 (50, 0-100)	<0.0001
Intimate relationship	68.38 (75, 0-100)	46.25 (50, 0-100)	0.0382
Burden to others	79.73 (83.3, 16-100)	51.97 (50, 0-100)	0.0003
Emotional health	81.76 (85.4, 25-100)	50.14 (50, 0-91.6)	<0.0001
Body image	84.09 (90.8, 5-100)	58.45 (66.6, 0-100)	0.0004
Fatigue	72.08 (75, 18.7-100)	41.2 (40.6, 6.2-81.2)	<0.0001

Conclusion: To our knowledge, this is the first study demonstrating significantly lower scores among MDD relative non-MDD (based on PHQ-9) patients across all the 8 domains of LupusQoL; therefore, it adds to the current evidence that depression significantly impacts the quality of life of SLE. Predictors of MDD include older age, and involvement of the vascular, mucocutaneous, pulmonary, and musculoskeletal system. Additionally,a poor or fair description of self-rated health was a predictor of depression.

AB1225 LIPID PROFILE COMPARISON IN RHEUMATOID ARTHRITIS AND PSORIATIC ARTHRITIS: A CASE-CONTROL STUDY

D. Á. Galarza-Delgado[1], J. R. Azpiri-López[2], I. J. Colunga-Pedraza[1], A. Pérez Villar[1], I. C. Zárate Salinas[2], P. F. Frausto Lerma[1], M. A. Reyes Soto[1], D. E. Flores Alvarado[1], O. Ilizaliturri Guerra[1]. [1]*Hospital Universitario Dr. José Eleuterio González, Rheumatology Department, Monterrey, Mexico*; [2]*Hospital Universitario Dr. José Eleuterio González, Cardiology Department, Monterrey, Mexico*

Background: Rheumatoid arthritis (RA) and psoriasic arthritis (PsA) are autoimmune diseases, in both diseases it has been described that the main cause of morbidity and mortality is cardiovascular (CV) disease. Dyslipidemia is the most recognized CV risk factor. An association is recognized between the concentrations of total cholesterol (TC), high-density lipoprotein cholesterol (HDL-C), low-density lipoprotein cholesterol (LDL-C), total triglycerides (TG), atherogenic index (AI) and the risk of myocardial infarction (MI), stroke and fatal cardiovascular disease (CVD). The relationship between serum lipid levels and CVD risk is potentially paradoxical in RA but this relationship has not been clarified in PsA.
Objectives: To compare lipid profile between groups with RA, PsA and controls.
Methods: A cross-sectional observational study was designed, which included 95 patients between 45-75 years who fulfilled the CASPAR classification criteria for PsA. 95 patients between 45-75 years who fulfilled the ACR / EULAR 2010 classification criteria for RA and 95 age-matched controls. Concentrations of CT, HDL-C, LDL-C, TG and atherogenic index were compared between the groups. Clinical measures were compared using one-way ANOVA or Kruskall-Wallis tests. Post-hoc analysis was performed with Bonferroni's correction. A $p \leq 0.05$ was considered statistically significant. The data was analyzed using the SPSS version 25 software package.
Results: In our study, no significant difference in LDL-C was found between RA and PsA, however post-hoc analysis was performed where we found higher LDL-C levels among RA patients compared with controls (p 0.025). RA patients had higher HDL-C than PsA patients (p 0.006) but PsA had a higher HDL-C than controls (p 0.007). TC/HDL-C was higher in PsA than RA and controls (p 0.050). PsA patients were the group with the lowest HDL-C levels (p 0.007). In contrast RA were the groups with the highest HDL-C levels (p 0.007). (Table 1).

Table 1. Clinical parameters.

PARAMETER	*RA*	*PsA*	*Controls*	*p*
TC*	176.6 ± 37.2	176.3 ± 35.9	186.34 ± 33.172	0.089
TG**	132.7 (102.0-187.3)	131.0 (97.2-189.2)	118.35(88.2-162.25)	0.245
HDL-C**	50.7 (42.1-62.6)	46.7 (37.4-53.9)	51.7 (41.3-60)	**0.007**
LDL-C*	94.36 ± 21.70	97.71 ± 30.12	105.32 ±31.35	**0.025**
TC/HDL-C**	3.41 (2.81-4.08)	3.74 (3.17-4.47)	3.49 (2.99-4.52)	**0.050**

*Data are reported in mean ± SD
**Data is reported in median (IQR)

Conclusion: Patients with inflammatory joint diseases have more adverse lipid profiles than controls.

AB1226 PREDICTING CARDIOVASCULAR EVENTS IN PATIENTS WITH SPONDYLOARTHRITIS AND PSORIATIC ARTHRITIS: THREE RISK ALGORITHMS

A. S. Pinto[1], F. Cunha Santos[1], S. P. Dinis[1], J. F. Ferreira[1,2], C. Vaz[1,2]. [1]*Local Health Unit of Guarda, Guarda, Portugal*; [2]*Beira Interior University, Covilhã, Portugal*

Background: Inflammatory joint disorders have an increased cardiovascular (CV) risk when compared with general population. In 2009, the EULAR task force advocated the use of a 1.5 multiplication factor for these risk prediction models in Rheumatoid Arthritis patients with specific characteristics. The SCORE was not modified in patients with Psoriatic Arthritis (PsA) and Spondyloarthritis (SpA) in accordance with the present EULAR recommendations.
Objectives: To assess the accuracy of several CV risk algorithms to predict an event and determine its sensibility and specificity.
Methods: A retrospective analysis of PsA and SpA patients, followed in our department in Local Health Unit of Guarda during one year (2019) was done. We determined CV risk profile of our patients using the following data: gender, age, smoking status, blood pressure, lipid values and diabetes mellitus status. These variables were used to calculate risk prediction algorithms such as Framingham, the American College of Cardiology/American Heart Association (ACC/AHA) risk score and the Systematic Coronary Risk Evaluation (SCORE). Discriminatory ability for CV risk prediction was evaluated by the area under the ROC curves. Sensibility and specificity were calculated for low-to-intermediate and intermediate-to-high risk cut-offs. Cut-off values that mark the high risk were defined in 5% for SCORE, 20% for Framingham and ACC/AHA.
Results: 112 caucasic patients were included, 61% female with a mean age of 52.15±14.18 years and mean BMI of 27.11±4.81kg/m^2. 7 patients weren´t eligible to apply these cardiovascular scores. 8 patients were identified with non-fatal cardiovascular events (2 cases of stroke, 5 cases of myocardial infarction and 1 case of thrombophlebitis). 69 patients diagnosed with SpA and 43 with PsA, five CV events identified in SpA patients and three in PsA patients. Area under the ROC in SpA were 0.729 (95% CI 0.461 to 0.996) for SCORE, 0.839 (95% CI 0.735 to 0.943) for Framingham and 0.804 (95% CI 0.683 to 0.925) for ACC/AHA. Area under the ROC in PsA patients were 0.603 (95% CI 0.327 to 0.879) for SCORE, 0.660 (95% CI 0.326 to 0.995) for Framingham and 0.804 (95% CI 0683 to 0.925) for ACC/AHA. Sensibility and specificity were discriminated in table 1.

Table 1. Sensibility, specificity, positive predictive value (PPV) and negative predictive value (NPV) of CV risk algorithms

	Sensibility (%)	Specificity (%)	PPV (%)	NPV (%)
SCORE > 1%				
SpA	75	63	18	96
PsA	100	41	5	100
SCORE > 5%				
SpA	NA	NA	NA	NA
PsA	0	93	0	97
Framingham >10%				
SpA	83	78	28	98
PsA	50	51	5	95
Framingham >20%				
SpA	33	86	20	93
PsA	50	69	8	96
ACC/AHA >5%				
SpA	67	77	29	94
PsA	100	44	9	100
ACC/AHA >20%				
SpA	17	86	14	88
PsA	50	83	14	97

Conclusion: A good discrimination between patients with or without CV events has been demonstrated by area under the ROC curve, particularly to SpA patients. In PsA, the sample was smaller, which represents a limitation in this study. SCORE >5% did not identify CV events, therefore sensibility couldn't be calculated. Overall, the algorithms studied presented a low sensibility, underestimating CV risk. This could be explained since disease-related factors are not reflected in these scores. In our opinion, better algorithms are needed to correctly assess cardiovascular risk algorithms for SpA and PsA, since the majority of the events occur in patients with low-intermediate risk.

AB1227 PREVALENCE OF RHEUMATIC MUSCULOSKELETAL DISORDERS IN A RURAL AREA OF UPPER EGYPT: WHO-ILAR COPCORD BASED COMMUNITY STUDY

S. Rashad[1], E. Abda[2], Z. Selim[3], S. Hussein[2], T. Metwally[4], D. Fouad[5]. [1]*Suez University, Rheumatology & Rehabilitation, Suez, Egypt*; [2]*Assiut University, Rheumatology & Rehabilitation, Assiut, Egypt*; [3]*Assiut, Rheumatology & Rehabilitation, Assiut, Egypt*; [4]*Suez University, Family Medicine, Suez, Egypt*; [5]*South Egypt Cancer Institute, Radiology, Assiut, Egypt*

Background: Rheumatic musculoskeletal disorders (RMSDs) are a common cause of long term pain and physical disability. In developed countries, RMSDS are a major cause of absence from work and thus have a big financial burden on the country economic status. Several studies have been published the incidence and prevalence of RMSDs in different world countries and found to be widely variable. Estimation of the extend of the problem of RMSDs in developing world, especially in rural economies will help better understanding of the risk factors that contribute to the initiation and progression of these diseases and help the health care authorities to provide proper health program services in these areas to reduce the physical and financial burden of RMSDs (Bagher et al., 2011; Majumdar et al., 2015 and Usenbo, et al., 2015).
Objectives: To estimate the prevalence rate of RMSDs in a rural population in Upper Egypt.
Methods: A cross-sectional based study was carried out and included 3988 subjects of population (2013 females and 1975 males). Mean age of patients was (46.89±15.25ys). They proceeded 4 phases of World Health Organization/International League of Associations for Rheumatology community-oriented program for control of rheumatic diseases survey questionnaire WHO-ILAR Community Oriented Program for screening of rheumatic diseases. Modified Health Assessment Questionnaire (HAQ) was used to assess the disability severity. Individuals suspected to have any rheumatic diseases were subjected to full clinical examination, laboratory and radiological investigations to reach a final diagnosis. They were classified according to appropriate criteria of diagnosis of diseases.
Results: A prevalence rate of RMSDs was 16.22%, more prevalence in females (10.38% vs. 5.84% for males, P=0.000). The mean age of patients with RRMSDSs were older (46.89±15.25 yrs) than healthy individuals (29.56±18.95 yrs) (P=0.0001) and with increasing age (≥45-≤ 55 yrs).The identified RMSDs were OA (8.5%), Soft tissue rheumatism (STR) (6.57%), spinal disorders (SD) (6.47%), fibromyalgia (FM) (0.60%), RA (0.30%), arthralgia (0.18%), SPAs (0.15%), Gout(0.6%), Pseudogout (0.08%), SLE (0.5%), JIA(0.03) and MCTD (0.03%). The prevalence rates for the majority of RRMSDSs were higher in females and with increasing age. About two thirds of the patients had grade II disability.
Conclusion: The prevalence rate of RMSDs in a rural population ≥15years in Upper Egypt has been estimated to be 16.22%.The most prevalent RMSDs are OA, STR and SD causing the greatest burden of the disease. The predictive risk of RMSDs has to be assessed in future studies.

AB1228 COMPARATIVE ANALYSIS OF COMORBID PATHOLOGY IN PATIENTS WITH RHEUMATOID ARTHRITIS AND ANKYLOSING SPONDYLITIS

T. Raskina[1], O. Malyshenko[1], E. Usova[1], M. Letaeva[1], J. Averkieva[1]. *[1]Federal State Educational Institution of Higher Education "Kemerovo State Medical University", Kemerovo, Russian Federation*

Background: Interest in comorbid conditions in rheumatoid arthritis (RA) and ankylosing spondylitis (AS) is due to their influence on the course and prognosis of the disease itself, the quality of life of patients and the choice of treatment tactics.
Objectives: To compare the frequency and structure of comorbid pathology in patients with RA and AS.
Methods: 130 cases of patients with RA (95 women, 35 men, average age 47±6.6 years) and 86 with AS (27 women and 59 men, average age 44 ±7.4 years) were analyzed. The effect of concomitant pathology on the long-term prognosis was evaluated using the Charlson comorbidity index.
Results: Patients with RA had a combined pathology in 93.0% (122) cases, of which 24.5% (30) – one, 28.6% (35) – two, 46.7% (57) – three or more concomitant diseases. Concomitant diseases in AS patients were registered in 83.7% (72) of cases, including one in 36% (31), two in 14% (12), and three or more in 33.7% (29). The Charlson index from 1 to 2 points was determined in 78.5% (102) of RA patients and in 77.9% (69) of patients with AS (p=0.067). Values from 3 to 4 points had 19.2% (25) and 20.9% (18) of patients, respectively (p=0.064). The Charlson index of more than 5 points was registered in 2.3% (3) patients with RA and 1.2% (1) patients with AS.
The leading place in the structure of comorbidity in the group of patients with RA was occupied by diseases of the digestive system, which was observed in 79.2% (103) of patients. In the second place in the same group were registered cardiovascular diseases (CVD) – in 48.5% (63) patients, the most common arterial hypertension – in 36.9% (48). 27.6% (36) of patients had chronic pyelonephritis in combination with urolitiasis. Osteoporosis was detected in 20.0% (26) of RA patients.
In the group of patients with AS, diseases of the digestive system were also most frequently registered – in 76.7% (66) of patients. CVD was observed in 41.9 % (36) patients, of which 39.5% (34) had hypertension. Kidney diseases were registered in 9.3% (8) of patients. Osteoporosis was detected in 32.5% (28) of patients with AS.
Comparative analysis of the structure and frequency of diseases of the digestive system in RA and AS revealed no significant differences. CVD was registered more often in RA than in AS (48.5% vs 41.8%, p=0.037). There were significant differences in the frequency of hypertension in the study groups of patients: hypertension was observed more often in patients with as in 39.5% of cases, while in RA only in 36.9% (p=0.041), which is probably due to long-term use of medium and high doses of NSAIDs as "basic therapy" for AS. Kidney diseases were more common in RA than in AS (27% vs 9.3%, p=0.022). Osteoporosis, in contrast, was most frequently detected in patients with AS than in RA patients (32.2% vs 20%, p=0.047).
Conclusion: Despite differences in the pathogenesis of RA and AS, the long-term prognosis, determined by both rheumatic disease and comorbidities, did not differ significantly. Concomitant pathology is an important component that determines the management of patients.

AB1229 SAFETY OF BIOSIMILAR ETANERCEPT IN THE TREATMENT OF RHEUMATIC DISEASES: DATA FROM THE MEXICAN ADVERSE EVENTS REGISTRY (BIOBADAMEX)

V. Rivera Teran[1], M. Pérez Rodríguez[2], D. Alpizar-Rodriguez[3], F. Irazoque-Palazuelos[4], S. Carrilo[4], S. Sicsik[4], D. Vega-Morales[4], D. Miranda[4], A. Castillo[4], J. C. Casasola[4], C. F. Pacheco Tena[4], J. F. Moctezuma[4], F. Aceves[4], A. Paz[4], S. Duran Barragan[4], L. Barile[4], N. Santana[4], D. X. Xibille Friedmann[4]. *[1]Colegio Mexicano de Reumatología, Unidad de Investigación, Mexico City, Mexico; [2]Instituto Mexicano del Seguro Social, Centro de Adiestramiento en Investigación Clínica, Mexico City, Mexico; [1]Colegio Mexicano de Reumatología, Unidad de Investigación, Mexico City, Mexico; [4]Colegio Mexicano de Reumatología, Mexico City, Mexico*

Background: Access to biosimilar drugs in Mexico started on 2014. Although biosimilar drugs safety has proved comparability to originator drugs on trials, information about its safety on real-life data is limited.
Objectives: To compare safety in terms of adverse events of biosimilar etanercept (BEt) to originator etanercept (OEt) using information from the Mexican Adverse Events Registry (BIOBADAMEX).
Methods: BIOBADAMEX is a Mexican cohort that collects the information of biologic and biosimilar drugs used in patients with rheumatic diseases in public and private practice since 2016. Patients enrolled are followed- up yearly. For this study we included patients from 18 to 65 years old who were or are currently in treatment with OEt or BEt and analyzed the frequency of adverse events (AE), the severity and the outcome of these. Baseline time was considered at enrolment to the cohort. We used logistic regression to analyze univariable and multivariable associations.
Results: At the time of analysis a total of 119 have received treatment with OEt, 38 with BEt. Mean follow up time was 1.35 years. Rheumatoid arthritis (RA) was the most common disease for all the groups followed by ankylosing spondylitis (AS) and psoriatic arthritis (PsA). Both groups had similar baseline characteristics (Table 1). AE occurred in 4 (3.4%) patients with OEt and in 6 (15.8%) with BEt (OR 0.2, 95% CI 0.04-0.7). The most frequent AE in OEt group was allergic reaction, (2(2.5%) of patients), and infections were the most frequent AE in BEt group (2 (5.3%)). Of patients with BEt, 2(5.3%) had severe AE compared to none in the OEt (p=0.012). In the multivariable adjusted analysis comparing development of AE vs no AE including BEt, comorbidities and glucocorticoids, we found that use of BEt (OR 4.6, 95%CI 1.1-19.5) and presence of comorbidities (OR 4.6, 95%CI 1.01-20.5), were associated with AE. Use of glucocorticoids was not significantly associated.

Table 1. Baseline characteristics

	Originator etanercept (n=119)	Biosimilar Etanercept (n=38)	Univariable Analysis [a] OR(95%CI)
Sex (female), n(%)	98 (82.4)	27 (71.0)	1.9 (0.8-4.4)
Age, median (IQR)	53.6 (45-61)	51.3 (43-58)	1.0 (0.9-1.0)
Body Mass Index, median (IQR)	27.5 (23.4-32.5)	26.7 (24-29)	1.0 (0.9-1.1)
Diagnosis, n(%):			
Rheumatoid arthritis	98 (82.4)	26 (68)	1
Ankylosing spondylitis	13 (10.9)	9 (24.0)	0.3 (0.1-0.9)
Psoriatic arthritis	8 (6.9)	3 (8.0)	0.7 (0.1-2.8)
Comorbidities, n(%):	41 (34.5)	14 (40.0)	0.3 (0.3-1.5)

Table 1. Baseline characteristics

	Originator etanercept (n=119)	Biosimilar Etanercept (n=38)	Univariable Analysis [a] OR(95%CI)
Use of previous biologic, n(%):	95 (79.8)	16 (42.1)	**5.4 (2.5-11.9)**
Use of steroids, n(%):	45 (37.8)	22 (57.8)	0.4 (0.2-0.9)
Use of DMARD, n(%):	94 (78.9)	35 (92.1)	0.3 (0.1-1.1)
Adverse events[b], n(%):	4 (3.4)	6 (15.8)	**0.2 (0.04-0.7)**
Infections[b], n(%):	1 (0.8)	2 (5.3)	0.15 (0.1-1.7)
Allergic reactions[b], n(%):	3 (2.5)	1 (2.6)	0.9 (0.1-9.5)
Severe[b], n(%):	0 (0)	2 (5.3)	**p=0.012** [c]

[a]Univariable logistic regression analysis. [b]Cumulative at time of analyses, [c]Chi-square test.

Conclusion: This preliminary study showed that AE with BEt were more frequent as well as more severe compared to AE presented with OEt in patients with rheumatic diseases using BIOBADAMEX data. Our study suggests that use of BEt and comorbidities are associated with the development of AE. Follow up and inclusion of more participants is going on and will allow us to perform further analyses.

AB1230 PERIPHERAL ARTERY DISEASE AND JOINT PAIN IN TYPE 2 DIABETES PATIENTS, FROM ASSOCIATION TO CAUSATION

E. Shalaeva[1], A. Shalaeva[1], N. Dadabaeva[1], K. Mirakhmedova[1]. [1]*Tashkent Medical Academy,Tashkent, Uzbekistan*

Background: Type 2 diabetes mellitus (T2DM) and arthritis are considered two separate conditions. However, inflammation and metabolic changes play a major role in diabetes co-morbidity (1). The pathogenesis of the joint pain and stiffness in diabetes patients is not fully understood. Diabetic osteoarthropathy (neuropathic arthropathy) considers a quite rare condition (0.1–0.4% of diabetic patients), involving destructive, lytic joint changes (2). Interestingly, over 52% of diabetic patients have joint diseases, compare to only 27% without diabetes; and people with arthritis have over 60%higher risk of diabetes development (3).

Objectives: The purpose of the study was to determine the association between the lesions of low extremity arteries (LEA) and the prevalence of arthritis (joint pain and stiffness) among patients with type 2 diabetes.

Methods: This is the pilot analysis of the musculoskeletal data obtained from the prospective cohort study of patients with diabetes complications 2013-2016 (179 consecutive T2DM pts undergoing transfemoral amputation (TFA) due to gangrene of lower limb (4,5), and 199 patients experienced balloon angioplasty (BA) of the LEA (without gangrenes). The computer tomography angiography was performed, along with clinical, laboratory and instrumental examination. Functional class of joint lesions (hip, knee or foot) was obtained based on self-service and (un)professional activity.

Results: All observed patients had diabetic neuropathy. The affected extremity in all the patients undergoing TFA had critical arterial ischemia along with foot gangrene, knee/hip pain, stiffness and rigidity. The second extremity also had stenoses of popliteal, anterior or posterior tibial arteries and the severity of stenoses was positively correlated with the severity of muscle and joints pain (r=0.771, p<0.001).

Among 199 patients without gangrene of lower limb, BA was done on superficial femoral artery 46 (23.1%) patients, popliteal in 44 (22.1%), posterior tibial 54 (27.1%), arterial tibial 41 (20.6), and peroneal artery 14 (7%). At least 1 large and 1 small joint was affected per person. The correlation between the prevalence of joint pain/stiffness and peripheral artery stenosis of the same lower extremity in patients without gangrene was significant r=0.632, indicating a large positive relationship (approximately 39.9% of the total variance). A linear regression analysis was conducted to evaluate the association between the severity of artery lesions and the severity of joint functional class, F (1, 198) = 57.82, p<0.001, t = 7.91, p < 0.001. The 95% confidence interval for the slope was 0.71 to 1.29, which did not include the value of zero.

Conclusion: The results show that the more severe the peripheral artery stenosis was the more prevalent join lesions are and worsen the function class. However, more studies are needed.

AB1231 2019 LUPUS CLASSIFICATION CRITERIA SCORE PREDICTS FUTURE LUPUS HOSPITAL ADMISSION

S. Suman[1], M. Eissa[2], H. Rogers[3], A. Lenert[4], A. Stromberg[5], W. Roberts[3]. [1]*University of Kentucky, Internal Medicine, Lexington, United States of America*; [2]*Cairo University, Cairo, Egypt*; [3]*University of Kentucky, Rheumatology, Lexington, United States of America*; [4]*University of Iowa, Rheumatology, Iowa City, United States of America*; [5]*University of Kentucky, Statistics, Lexington, United States of America*

Background: There are several validated tools to quantitate lupus disease activity, end-organ damage and overall fragility. An algorithm to predict the hospitalization risk in lupus patients was proposed by Li et al[1]. That algorithm was able to effectively screen patients at increased risk of hospitalization using EHR information only. Recently, the new 2019 Lupus classification criteria score has been noted to accurately predict 10 year mortality[2].

Objectives: To test the above 2 algorithms with potential to predict lupus related hospital admissions.

First, we attempted to validate the existing algorithm from the index study of Li et al to predict lupus hospitalization.

Second, we tested the 2019 lupus clinical classification score for its ability to predict hospitalizations.

Methods: A retrospective chart review was performed using EHR data collected from 2013 to 2018 at University of Kentucky (UK) Medical Center. Inclusion criteria were 18 years or older at first outpatient rheumatology appointment at UK, at least 3 outpatient rheumatology visits at UK, and ICD 9/10 code for Lupus. A total of 217 patients met inclusion criteria. Variables similar to the index study were extracted from patients' first outpatient rheumatology visit at UK. Additionally, 2019 Lupus Classification Criteria score was calculated. Patients who were subsequently hospitalized, manual chart review was done to determine if the hospitalization was attributable to lupus or not.

Results: Table 1 shows differences between the variables predicting hospitalization in patients in this study (UK) and the Ohio State University (OSU) cohort from whom the admission predicting algorithm was derived[1]. All the risk factors that were found to predict lupus hospitalization in the index study, failed to achieve a statistical significance in our validation study.

Table 1. Differences in the variables predicting hospitalization between Index and Validation Cohort

Variables predicting Lupus Hospitalization	Index Study (Ohio State), % of patients (n=226)	Validation Study (University of Kentucky) % of patients; (n=217)
African American	33%	18%
Creatinine > 1.2	17%	7%
Hemoglobin < 11g/dl	79%	18%
Platelets < 180 / uL	75%	22%
High Risk immunosuppression	35%	9. 2%
Missed appointment	27%	25%

There was more success predicting lupus hospitalization using the 2019 lupus classification criteria score (CCS) (Figure 1). A CCS >=19 predicted higher risk of lupus related hospitalization vs CCS < 19 over the ensuing 2 years (p-0.05).

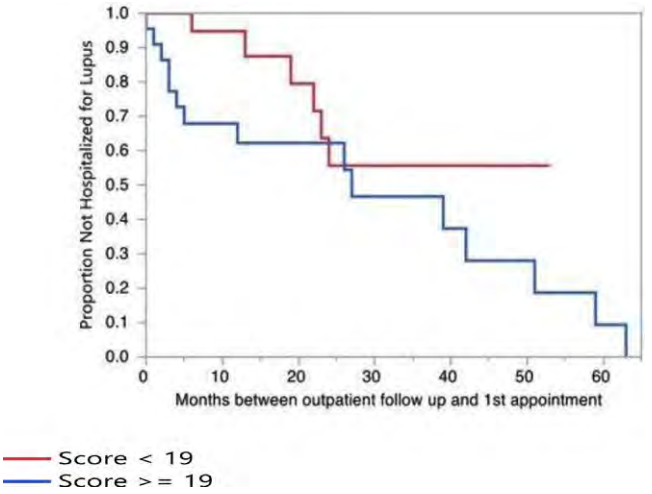

Figure 1. Kaplan- Meier Survival Analysis comparing the risk of hospitalization between the groups with 2019 Lupus classification criteria score (CCS) of less than 19 (red) and more/equal to 19 (blue). A time-dependent effect, with the admission free survival curves crossing at two years (Figure 1), indicated a 1 out of 3 chance of lupus related admission during the first 6 months for a high CCS score > =19.

Conclusion: We failed to validate the EHR algorithm identifying patients at high risk for lupus hospitalization in our less severely affected cohort with fewer admission events to analyze. Nonetheless, "criteria counting" using the weightings of the 2019 lupus classification criteria was granular enough to make these case finding criteria themselves prognostic for future hospitalization risk. It is likely that existing EHRs, using protocols based upon classification criteria scores, are now capable of predicting survival, costs, and admissions automatically.

AB1232 ORAL DYSBIOSIS REFLECTS THE IMMUNOLOGICAL ALTERATION OF RA REGARDING TO ACPA AND HLA DRB1*SE: NAGASAKI ISLAND STUDY

Y. Tsuji[1], M. Tamai[1], S. Morimoto[1], D. Sasaki[1], M. Nagayoshi[2], F. Nonaka[1], S. Y. Kawashiri[1], K. Yanagihara[1], T. Saito[1], K. Aoyagi[1], T. Maeda[3], F. Matsuda[4], A. Kawakami[1]. *[1]Nagasaki University, Nagasaki, Japan*; *[2]National Institute of Public Health, Wako, Japan*; *[3]Nagasaki University, Department of General Medicine, Nagasaki, Japan*; *[4]Kyoto University, Kyoto, Japan*

Background: Anti-citrullinated protein antibody (ACPA) production is observed in several organs even prior to the onset of rheumatoid arthritis (RA), and oral mucosa is considered to be one of the important tissues. The presence of HLA-DRB1*SE closely associates with ACPA production. Saliva is considered to reflect the oral microbiota including periodontal disease. Alteration of oral microbiota of RA becomes to be normalized by DMARDs treatment, however, the interaction of HLA-DRB1*SE, ACPA and oral microbiota of RA patients remains to be elucidated.

Objectives: The Nagasaki Island Study, which had started in 2014 collaborating with Goto City, is intended for research of the preclinical stage of RA, including ACPA/HLA genotype screening and ultrasound and magnetic resonance imaging examinations in high-risk subjects. Using the samples accumulated in this cohort, we have tried to investigate the difference of oral microbiota among RA patients and healthy subjects regarding to ACPA and HLA-DRB1*SE.

Methods: Blood and salivary samples were obtained from 1422 subjects out of 4276 who have participated in the Nagasaki Island Study from 2016 to 2018. ACPA positivity was 1.7 % in total. Some of RA patients resided in Goto City participated in the Nagasaki Island Study. At this point, we selected 291 subjects, who were ACPA positive non-RA healthy subjects (n=22) and patients with RA (n=33, 11 subjects were ACPA positive and 22 ACPA negative respectively) as the case, age and gender matched ACPA negative non-RA healthy subjects (n=236) as the control. ACPA was measured by an enzyme-linked immunosorbent assay, and HLA genotyping was quantified by next-generation sequencing (Ref.1). The operational taxonomic unit (OUT) analysis using 16S rRNA gene sequencing were performed. The richness of microbial diversity within-subject (alpha diversity) was scaled via Shannon entropy. The dissimilarity between microbial community composition was calculated using Bray-Curtis distance as a scale, and differences between groups (beta diversity) were tested by permutational multivariate analysis of variance (PERMANOVA). In addition, UniFrac distance calculated in consideration of the distance on the phylogenetic tree were performed.

Results: Median age 70 y.o., % Female 58.8 %. Among RA and non-RA subjects, not alpha diversity but beta diversity was statistically significance (p=0.022, small in RA). In RA subjects, both alpha and beta diversity is small (p<0.0001), especially significant in ACPA positive RA (Figure 1). Amongt RA subjects, presence of HLA-DRB1*SE did not show the difference but the tendency of being small of alpha diversity (p=0.29).

Conclusion: Our study has suggested for the first time the association of oral microbiota alteration with the presence of ACPA and HLA-DRB1*SE. Oral dysbiosis may reflect the immunological status of patients with RA.

AB1233 GENDER DIFFERENCE IN DISEASE SEVERITY AND TREATMENT OUTCOMES AMONG PATIENTS WITH RHEUMATOID ARTHRITIS (RA), AXIAL SPONDYLOARTHRITIS (AXSPA) AND PSORIATIC ARTHRITIS (PSA) STARTING TREATMENT WITH TARGETED THERAPY IN THE CZECH REPUBLIC

J. Zavada[1], L. Nekvindova[2], K. Pavelka[1], P. Horak[3], J. Vencovský[1]on behalf of collaborators of the ATTRA registry. *[1]Institute of Rheumatology, Prague, Czech Republic*; *[2]Institute of Biostatistics and Analyses, Faculty of Medicine, Masaryk University, Brno, Czech Republic*; *[3]Faculty of Medicine and Dentistry, Palacký University, 3rd Department of Internal Medicine-Nephrology, Rheumatology, Endocrinology, Olomouc, Czech Republic*

Background: The ATTRA registry captures more than 95% of patients with RA, AxSpA, or PSA treated with biologics in the Czech Republic (CZ). In CZ, anti-TNF therapy is reimbursed for RA if DAS28>5.1 despite therapy with csDMARDs, for PSA if disease is not "adequately controlled" with csDMARDs and for AS if BASDAI>4 and CRP/ESR elevated above normal.

Objectives: We aimed to investigate gender-related differences in baseline characteristics and treatment effectiveness among patients with RA, AxSpa, and PsA starting first targeted therapy (TT) in CZ.

Methods: In this observational cohort study, the ATTRA register provided prospectively collected data on RA, AxSpA and PsA patients who initiated their first TT (mostly by TNFi) in 2012–6/2018. Treatment effectiveness and adherence was assessed at 12 months by a change in patient-reported outcomes (PROs), CRP and % drug survival. Differences in categorical and continuous data btw males and females were assessed using the Pearson X^2 test (of Fisher exact test, as appropriate), or Mann-Whitney test resp. This study was largely descriptive, and no statistical adjustments have been made.

Results: A total of 1602 RA, 1306 AxSpa, and 493 PsA patients were included. The difference in baseline characteristics btw women and men starting TT are shown in table 1. Their response and adherence to TT after one year is shown in table 2.

Conclusion: When starting their first TT, males tended to have higher levels of CRP, while females were more often (ex)smokers and reported worse parameters of quality of life across the diagnostic groups. The improvement of PROs was similar in males and females, while males with axSpA and PsA showed larger improvements in CRP. Survival on drug at one year was similar, save for AxSpA, where males showed better survival.

AB1234 MICRO-RNA 155 AND MIR-34A: POSSIBLE BIOMARKERS OF INFLAMMATORY BURDEN AND DISEASE ACTIVITY IN ANCA-ASSOCIATED VASCULITIS WITH RENAL INVOLVEMENT

D. Bruno[1], P. G. Cerasuolo[1], C. Di Mario[1], S. L. Bosello[1,2], L. Gigante[1], A. Musto[1], G. Vischini[3], S. Costanzi[3], S. Alivernini[1,2], B. Tolusso[2], G. Grandaliano[3,4], E. Gremese[1,2]. [1]*Division of Rheumatology, Università Cattolica del Sacro Cuore, Rome, Italy*; [2]*Division of Rheumatology, Fondazione Policlinico Universitario A. Gemelli-IRCCS, Rome, Italy*; [3]*Division of Nephrology, Fondazione Policlinico Universitario A. Gemelli-IRCCS, Rome, Italy*; [4]*Division of Nephrology, Università Cattolica del Sacro Cuore, Rome, Italy*

Background: Predicting clinical outcomes in ANCA-related glomerulonephritis remains a major challenge. To date, there is no reliable biomarker able to predict renal prognosis in patients with ANCA-associated vasculitis (AAV). Micro-RNA (miRNA) are non-coding RNAs involved in the fine tuning of immune cells biology and this epigenetic modulation associates with different phenotypes and prognosis in several diseases.
Objectives: To investigate the expression of miR-155 and miR-34a in kidney biopsies of AAV patients according with renal outcome.
Methods: Fifteen patients with AAV and renal involvement (mean age 63.0 ±13.3 years, disease duration 4.9±2.2 months), who underwent renal biopsy. Demographic, clinical and autoimmune parameters were recorded for each patient. Each kidney biopsy was classified according to the Berden Classification, Risk group (according to the ANCA Renal Risk Score) and the chronicity Classification of the Mayo Clinic's proposed score.
MiR-155 and miR-34a expression was investigated on kidney biopsy tissue using the miRNeasy FFPE kit (Qiagen). The quantitative expression of miR-155, miR-34a and housekeeping gene U1, used as control, was assessed by Real Time-PCR. MiR-155 and miR-34a expression was correlated with histopathological and clinical-laboratory parameters.
Each patient was followed for 12 months and renal outcome was considered according to *KDIGO CKD* Classification. Markers of inflammation (ESR, CRP) and urine analysis data were recorded at baseline and after 12 months.
Results: Six (40%) patients were p-ANCA positive and 9 (60%) c-ANCA positive. Eight patients (53%) also had pulmonary involvement. The mean baseline GFR was 30.7±28.8 ml/min/1.73 m^2 and 10 patients (66%) showed an active urinary sediment.
At disease onset, the mean expression of miR-155 was 9.5±21.1, while the expression of mir-34a was 13.1±46.2. Considering the autoimmune profile, kidney tissue of p-ANCA positive patients was enriched of mir-155 (19.6±30.6 fold) compared to c-ANCA positive patients (1.9±2.9 fold; p=0.001). Particularly, considering the renal function, kidney tissue of patients with greater impairment of renal function (*KDIGO stage 5)* was enriched of miR-155 (21.5±38.3 fold) compared to patients with less renal impairment (*KDIGO stage 1-4*) (4.72±8.16 fold, p=0.004).
Tissue expression of miR-155 and miR-34a did not correlated with the above-mentioned histopathological classifications.
After 12 months from kidney biopsy, 3(20%) patients had a worsening of renal function, 5 (33%) still presented elevated markers of inflammation and 3 (20%) still had proteinuria at urine analysis. At baseline, kidney tissue of patients with higher CRP plasma levels and proteinuria at follow-up presented higher expression of miR-155 (p=0.002 and p=0.001), whereas no significant differences were found about miR-34a kidney tissue expression.
Conclusion: MiRNAs may play a potential role in the pathogenesis of ANCA-related glomerulonephritis. MiR-155 kidney enrichment seems to mirror the disease inflammatory burden and activity at the onset and after 12 months representing a possible biomarker in ANCA vasculitis with renal involvement. This finding may represent the basis for further studies on miRNA expression in blood samples, aiming to identify a non-invasive biomarker of kidney damage, predicting disease's relapses and patients' prognosis.

AB1235 SALIVARY LEVEL OF CALPROTECTIN (MRP 8/14) AS A BIOMARKER FOR SJÖGREN SYNDROME – A PROSPECTIVE OBSERVATIONAL STUDY

P. Chebbi[1], J. Kabeer[1], P. Sandhya[1], M. Gowri[1], D. Danda[1]. [1]*CMC Vellore, Tamil Nadu, India*

Background:
Objectives: Calprotectin (MRP 8/14) is secreted by neutrophils and monocytes in an inflammatory milieu(1). Increased levels of calprotectin in blood and faeces has been previously shown in patients with primary Sjogren's syndrome(pSS)(2). We hypothesised Calprotectin in saliva may therefore potentially reflect inflammation in salivary glands. In the present study, we aimed to assess the utility of salivary calprotectin as a biomarker in pSS and to evaluate the potential association of calprotectin with clinical features, laboratory markers and disease activity indexes in pSS.
Methods: Consecutive patients attending rheumatology clinic between September 2016 and July 2017 of age more than 18 years fulfilling either American European Consensus Group (AECG) 2002 or 2016 American College of Rheumatology/European League Against Rheumatism Classification Criteria for Primary Sjogren's Syndrome, constituted the case group. Patients with sicca non-pSS and rheumatoid arthritis patients satisfying ACR/EULAR criteria 2010 were recruited as disease controls. Age and sex-matched healthy subjects were recruited as a controls. Patient history, signs and symptoms, laboratory investigations, ESSDAI and ESSPRI scoring were noted for cases and disease controls. Unstimulated saliva was collected by the spitting method. Salivary calprotectin levels were quantified by commercially available ELISA kit(R&D Systems, MN, USA).
Results: A total of 42 pSS cases (41.5911.21 years, 40 women), 40 disease controls (47.629.81 years, 39 women) and 30 healthy controls (3610.65 years, 29 women) were recruited. In pSS and disease controls, the median levels of salivary calprotectin [38.5(81) and 52(69.5 ng/ml)] were significantly higher compared to healthy controls [26.5(29) {p=0.001}]. Salivary calprotectin levels in pSS was positively associated with oral symptoms and negatively associated with immunosuppression of 1 year and more(P=0.04 and 0.03 respectively),but not ESSDAI,ESSPRI scores or lab parameters.
Conclusion: Salivary calprotectin was elevated in pSS compared to healthy subjects and was found to be positively associated with oral symptoms and with immunosuppressive treatment.

AB1236 KL-6 AS A BIOMARKER FOR SJÖGREN SYNDROME-ASSOCIATED INTERSTITIAL LUNG DISEASE: METHODOLOGY MATTERS

Y. H. Chiu[1], C. C. Lu[1], F. C. Liu[1], S. E. Tang[2], S. J. Chu[1], S. Y. Kuo[1], H. C. Chen[1]. [1]*Tri-Service General Hospital, National Defense Medical Center, Division of Rheumatology/Immunology/Allergy, Taipei, Taiwan, Republic of China*; [2]*Tri-Service General Hospital, National Defense Medical Center, Division of Thoracic Medicine and Critical Care, Taipei, Taiwan, Republic of China*

Background: Krebs von den Lungen-6 (KL-6) was recently found to be a serum biomarker for various disease associated interstitial lung disease (ILD) including primary Sjögren syndrome (pSS).[1] KL-6 is a high-molecular-weight glycoprotein in the Mucin 1 protein group and is majorly expressed by regenerating type II pneumocytes; hence, serum KL-6 levels may reflect the severity of pulmonary damage with regeneration.[2] Human KL-6 also promotes the proliferation and survival of pulmonary fibroblasts and the differentiation of myofibroblasts, which enhance fibrosis.[3, 4]

Objectives: To evaluate the agreement between the latex particle-enhanced turbidimetric immunoassay with enzyme-linked immunosorbent assay (ELISA) and association with clinical phenotypes.

Methods: This retrospective case-control study included 39 patients with pSS, of whom 21 (53.85%) patients developed ILD at the end of follow-up. The serum KL-6 level was compared between latex particle-enhanced turbidimetric immunoassay (Nanopia) and ELISA (MBS2601395; MyBioSource, CA, USA). Electronic medical records were reviewed, including clinical information, images, pulmonary function test, and laboratory results on inclusion, and a chest physician reviewed the results of pulmonary radiography.

Results: The two serum KL-6 immunoassays revealed a moderate correlation with a Pearson product-moment correlation coefficient of 0.427. Serum KL-6 levels, measured using ELISA, were 1920.10 ± 1974.26 U/mL and 894.11 ± 788.53 U/mL in the ILD and non-ILD groups, respectively (p = 0.001). The latex particle-enhanced turbidimetric immunoassay for serum KL-6 was 459.62 ± 331.41 U/mL and 265.33 ± 105.37 U/mL in the ILD and non-ILD group, respectively (p = 0.074). The predictive values of serum KL-6 in the area under the receiver-operating characteristic curve were 0.810 and 0.669 in ELISA and latex particle-enhanced turbidimetric immunoassay, respectively.

Conclusion: Serum KL-6 is a predicting biomarker in pSS patients who may develop ILD. However, the methodology of immunoassay may influence the efficacy of the prediction and clinical association.

AB1237 DIAGNOSTIC VALUE OF PROTEASOMAL AND AUTOPHAGIC MARKERS IN MUSCULAR DISEASES

U. Drott[1], P. Harter[2], H. Burkhardt[3], M. Mittelbronn[4]. [1]*Rheumatology Division, Goethe-University, Frankfurt, Germany*; [2]*Institute of Neurology (Edinger Institute), Goethe University, Frankfurt, Germany*; [3]*Rheumatology Division, Goethe-University Frankfurt, Frankfurt, Germany*; [4]*Luxembourg Center of Neuropathology (LCNP), Dudelange, Germany*

Background: Deficient cellular degradation pathways such as autophagy and the ubiquitin proteasome system (UPS) show a correlation with the onset of neurodegenerative diseases. Especially immune-mediated inflammatory myopathies often show therapy-resistant phenotypes with medical need for further understanding of pathogenesis und possible treatment.

Objectives: The aim of this work was to study an association of these two degradation pathways in a large group of different muscle entities and to examine a possible influence in the pathogenesis of the investigated muscle diseases. Furthermore, a potential benefit in diagnostics was studied using factors such as ubiquitin, p62, NBR1 and LC3 and their role as adapter molecules.

Methods: We examined ubiquitin, p62, NBR1 and LC3 on muscle biopsies from patients with the diagnosis of s-IBM, dermato- and polymyositis, muscular dystrophy, neurogenic atrophy, myotonic dystrophy type II (PROMM) and metabolic myopathies such as Pompe and McArdle disease. Immunohistochemical single and double stainings as well as immunofluorescence stainings were performed on cryosections. Furthermore, Western blot analysis was performed. The use of a histological score, defined as the product of the frequency of positive fibres and staining intensity, was used to investigate possible differences between the diseases in the expression of the investigated factors.

Results: Especially in s-IBM, myofibrillar myopathies and Pompe disease, proteasomal and autophagic markers were detected. On the other hand, neurogenic atrophy, McArdle disease and the majority of the myotonic dystrophies type II showed no positive signals, except for p62, which was detected especially in internalized nuclei and regenerative fibres. Overall, in all entities in regenerative and necrotic as well as in atrophic fibres, a positive staining for ubiquitin, p62, NBR1 and LC3 could be shown. Dermatomyositis showed a moderate immunoreactivity for p62 and NBR1 in the area of the perifascicular atrophy. Polymyositis showed a strong endomysial reaction in the area of the attacked muscle fibres, especially in the area of the lymphocytic infiltrates. The histological score showed that ubiquitin was significantly higher in s-IBM than in polymyositis. NBR1 was significantly higher in s-IBM than in dermatomyositis and muscular dystrophies. LC3 and p62 showed a significantly higher level in s-IBM as compared to dermatomyositis and polymyositis. Except for NBR1, a positive correlation of autophagic and proteasomal markers was shown in dermatomyositis. There was also a positive correlation between LC3 and ubiquitin in polymyositis. Using multivariate analysis and recursive partitioning, we could show a predictability of the diagnosis of s-IBM with a LC3 score above 3. On the other hand, a value below 3 excluded the diagnosis of s-IBM.

Conclusion: In particular, s-IBM, myofibrillar myopathies and Pompe disease showed a possible involvement disturbed proteasomal and autophagic degradation pathways in their pathogenesis. In addition, p62 and NBR1 seemed to have an important role in the immune response. Furthermore, the altered autophagic and proteasomal degradation pathways may be involved in ageing processes, sarcopenia and disease. In particular, LC3 seems to be suitable as a screening marker to recognize an idiopathic inflammatory myopathy. The other markers, such as p62, LC3, and NBR1, would be able to distinguish between the subgroups of idiopathic inflammatory myopathies. Therefore, LC3 could be included as a marker in the routine of neuropathological diagnostics. Further studies are needed to fully understand the role of proteasomal and autophagic factors in possible immune suppressive and immune modulatory therapies and to assess possible side effects.

AB1238 THE ARABIC LUPUSPRO: CROSS-CULTURAL VALIDATION OF A DISEASE-SPECIFIC PATIENT-REPORTED OUTCOME TOOL FOR QUALITY OF LIFE IN LUPUS PATIENTS

N. E. Elkaraly[1], S. I. Nasef[1], A. S. Omar[1], A. M. Fouad[2], J. Meenakshi[3], A. E. Mohamed[1]. [1]*Faculty of Medicine, Suez Canal University, Physical Medicine, Rheumatology and Rehabilitation, Ismailia, Egypt*; [2]*Faculty of Medicine, Suez Canal University, Public Health, Occupational and Environmental Medicine, Ismailia, Egypt*; [3]*Rush University, Medicine and Behavioral Sciences, Chicago, IL, United States of America*

Background: Systemic lupus erythematosus (SLE) is a chronic autoimmune disease with high morbidity and disability that affects all aspects of quality of life (QoL). (1) LupusPRO is a disease-targeted patient-reported outcome tool for the measurement of health and non-health related quality of life (HRQoL and Non-HRQoL) in SLE patients. (2)

Objectives: To translate, cross-culturally adapt, and validate the LupusPRO v.1.8 into the Arabic Language.

Methods: LupusPRO v.1.8 was translated into Arabic following the forward-backward translation guideline. (3) The Arabic version of LupusPRO was subsequently applied to 107 Egyptian SLE patients. To assess test-retest reliability, the Arabic LupusPRO was completed on two occasions, two weeks apart. Validation was performed against the Arabic version of Medical Outcomes Study Short Form (SF-36), the Systemic Lupus Erythematosus Disease Activity Index (SELENA-SLEDAI) and the Systemic Lupus International Collaborating Clinics/American College of Rheumatology damage index (SDI). Discriminant validity of Arabic LupusPRO was evaluated against the SF-36 (item 1), while the conceptual framework was evaluated by the confirmatory factor analysis (CFA).

Results: The study included 107 patients, 95% of whom were women. Their median age was 32 (range:18-55) years. Arabic LupusPRO's Cronbach's alpha ranged from 0.71 to 0.98 except for the social support domain (0.65). Test-retest reliability ranged from 0.83 to 0.98. Convergent validity with corresponding domains of the SF-36 was satisfactory. Criterion validity showed a weak and non-significant correlation of lupusPRO domains with SDI except for physical domain and significant weak correlation with SELENA-SLEDAI (Table1).

Discriminant validity showed acceptable results against the SF-36 (item 1). The CFA showed good model fit indices for the hypothesized item-to-scale relationships (CFI =0.988, TLI = 0.987, and RMSEA=0.062), with most of item-to-scale loadings greater than 0.9.

Conclusion: The Arabic version of LupusPRO v1.8 is a reliable and valid tool for measuring QoL(HRQoL and Non-HRQoL) in Arabic-speaking SLE patients.

AB1239

THE EFFECT OF INFLUENZA VACCINATION ON THE MULTI-BIOMARKER DISEASE ACTIVITY SCORE AND ITS COMPONENT BIOMARKERS IN HEALTHY SUBJECTS

D. Furst[1], L. Lenz[2], M. Horton[2], D. Flake[2], E. Sasso[3], M. E. Weinblatt[4].
[1]University of Washington, Seattle, United States of America; *[2]Myriad Genetics, Inc., Salt Lake City, United States of America*; *[3]Crescendo Bioscience, South San Francisco, United States of America*; *[4]Brigham and Women's Hospital, Boston, United States of America*

Background: The multi-biomarker disease activity (MBDA) blood test measures 12 protein biomarkers (IL-6, CRP, SAA, EGF, VEGF, VCAM, MMP-1, MMP-3, leptin, resistin, TNF-RI and YKL40). It uses a validated algorithm to provide a score on a scale of 1-100 for assessing disease activity in patients with rheumatoid arthritis (RA). The MBDA score reflects several molecular aspects of inflammation, including cytokines, acute phase reactants, growth factors, molecular adhesion, metalloproteinases and hormones. Insights gained by understanding how vaccination affects these biomarkers in healthy subjects - in whom the level of inflammation prior to vaccination should be low and stable - may aid the understanding of how vaccination affects patients with RA.

Objectives: The goal of this study was to understand how immunization of healthy subjects with the influenza vaccine affects the assessment of inflammation with the MBDA score and its 12 biomarkers.

Methods: A 4-strain influenza virus vaccine (Fluarix Quadrivalent, GlaxoSmith-Kline) was administered intramuscularly to 22 healthy volunteer subjects on October 24, 2018. Serum samples were obtained immediately prior to vaccination (baseline) and 1, 2 and 3 weeks after vaccination. No restrictions were placed on subject activity. Samples were stored at -80 °C until measurement of the 12 MBDA biomarkers for determination of the adjusted MBDA score, hereafter called the MBDA score. (Adjustment accounts for the effects of age, sex and adiposity[1]). MBDA scores (natural scale) and biomarker concentrations (log scale) were modeled using generalized estimating equations (GEE) that account for correlations between measurements from the same subject at multiple timepoints. Significance of MBDA score change or biomarker concentration change over time was determined by a likelihood ratio test of timepoints.

Results: Of the 22 healthy subjects receiving the influenza virus vaccine, 14 (63.6%) were female, with mean (SD) age of 40.0 years (8.9). MBDA scores were low (<30), moderate (30-44) or high (>44) for 15 (68%), 6 (27%) and 1 (5%) subjects at baseline, and this distribution was stable over time (Figure 1). Overall, MBDA scores did not change significantly over time (p=0.48, Figure 2). Mean changes in MBDA score (95% CI) from baseline to weeks 1, 2 and 3 were 0.32 (-3.07, 3.71), 0.82 (-3.03, 4.67) and 2.86 (-1.10, 6.82), respectively (Figure 2); the week 3 value becomes 0.95 (-1.78, 3.68) if the week 3 outlier is removed. Among the 66 post-baseline measurements of change in MBDA score (Figure 2), 3 (5%) exceeded the 95% CI for change in MBDA score in this study (i.e., 14). When assessing the entire cohort across all timepoints, EGF was the only biomarker that demonstrated statistically significant change over time ($p=5.6 \times 10^{-7}$). At weeks 1, 2 and 3, the mean relative concentrations of EGF, compared with baseline, were 0.62 (0.52, 0.74), 0.86 (0.70, 1.06) and 0.62 (0.50, 0.76), respectively.

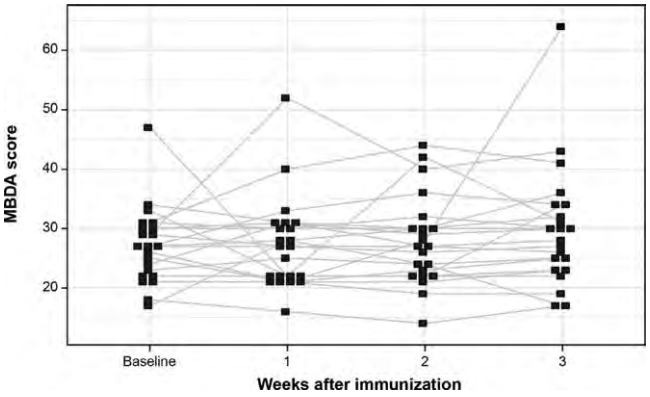

Figure 1

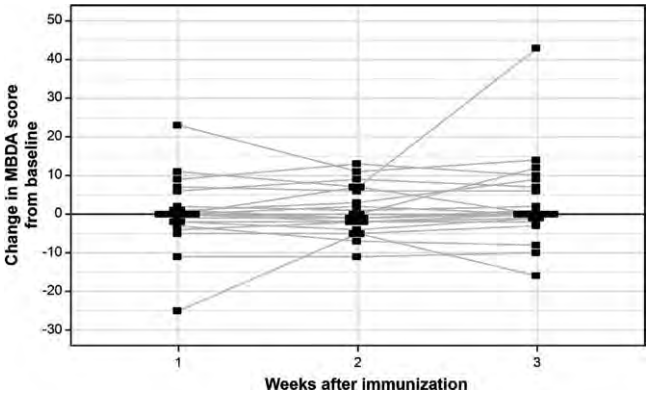

Figure 2

Conclusion: Immunization of 22 healthy subjects with a quadrivalent influenza vaccine did not have a statistically significant effect on MBDA scores during a 3-week observation, and it had minimal effect on the component biomarkers.

AB1240 C4B BINDING PROTEIN AND WARFARIN IN THE ANTIPHOSPHOLIPID SYNDROME

G. Grosso[1], K. Sandholm[2], I. Gunnarsson[1], A. Zickert[1], A. Vikerfors[3], A. Antovic[1], B. Nilsson[4], K. Nilsson Ekdahl[2,4], E. Svenungsson[1]. [1]*Karolinska University, Rheumatology, Solna, Sweden*; [2]*Linnaeus University, Center for Biomaterials Chemistry, Kalmar, Sweden*; [3]*Swedish Medical Products Agency, Uppsala, Sweden*; [4]*Uppsala University, Immunology, Genetics and Pathology, Uppsala, Sweden*

Background: Complement plays a role in the Antiphospholipid Syndrome (APS). C4b Binding Protein (C4BP) is a complement inhibitor with anticoagulant function (1). It belongs to the same protein family as β2GPI, the main antigen in APS. Its main isoform is bound to protein S in the circulation. Levels of both protein S and C4BP are known to be reduced by warfarin treatment (2) as well as by aPL, directly and indirectly.

Objectives: To investigate the levels of C4BP in primary (p) and secondary (s) APS, also considering warfarin treatment.

Methods: The total amount of C4BP (C4BPt) was measured by using magnetic carboxylated microspheres which were coupled with a monoclonal antibody against the α-chain of human-C4BP to capture the antigen. To detect C4BPt the same antibody was used, biotinylated. The binding of biotinylated antibodies was detected by streptavidin-phycoerythrin and data were collected using a MAGPIX Multiplex Reader. Using independent t-test, we compared C4BP in 118 SLE patients with repeated positivity for Antiphospholipid antibodies (aPL) (39/118 on warfarin), 291 aPL negative SLE patients (16/291 on warfarin), 67 pAPS (33/67 on warfarin), and 322 controls (none on warfarin). We then performed an interaction and a mediation analysis (3) in the SLE group to study the impact of warfarin on C4BP levels: since warfarin is mostly prescribed to aPL+ patients, it is considered a mediator in the reducing effect of aPL on C4BP. Therefore we compared individuals exposed and non-exposed to the presence of aPL with or without the mediator warfarin and calculated the percentage of reduction in C4BP that could be attributed to aPL or warfarin.

Results: Overall C4BP is 20% reduced in aPL+ patients (fig 1), independently of SLE, past thrombotic events and nephritis. Warfarin treated patients have lower levels of C4BP (fig 2). According to mediation analysis 11% of C4BP reduction is due to aPL and 9% to warfarin.

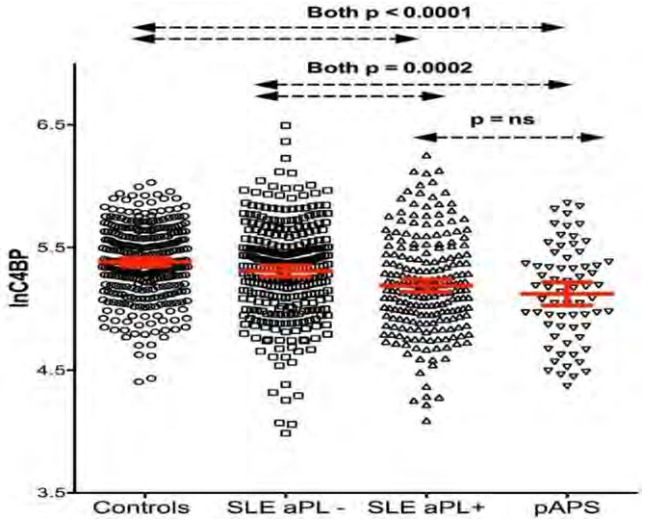

Figure 1. C4BP in different subgroups (67 pAPS, 118 SLEaPL+, 291 SLEaPL-, 322 controls)

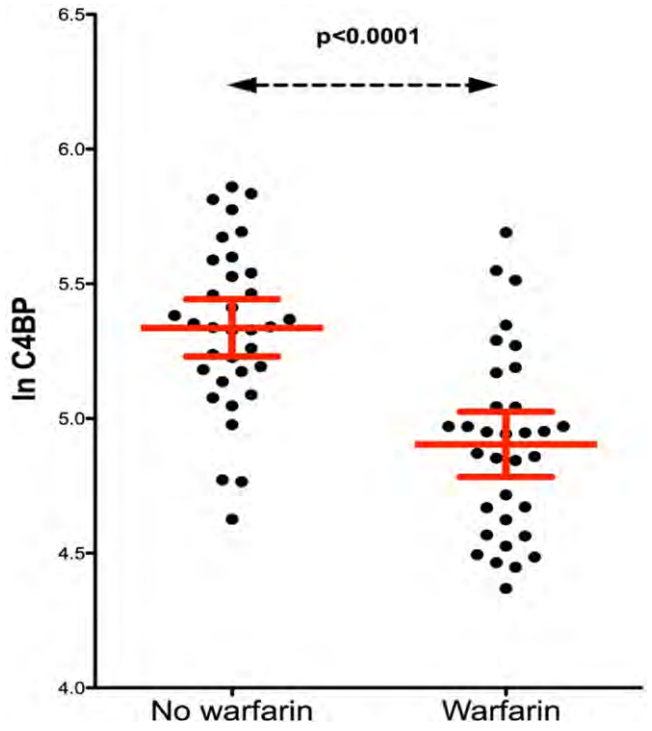

Figure 2. C4BP in 67 pAPS patients, 33/67 on warfarin

Conclusion: Both aPL and warfarin decrease levels of C4BP, a complement and coagulation regulator. Reduction of this complement inhibitor could contribute to complement activation and thrombosis in APS. Our results raise new questions regarding the effects of warfarin treatment on complement and coagulation in APS.

AB1241 EVALUATION OF A PATIENT COMPLETED DISEASE FLARE QUESTIONNAIRE IN PSORIATIC DISEASE

P. Helliwell[1], W. Tillett[2], R. Waxman[1], L. C. Coates[3], O. Fitzgerald[4], J. Packham[5], N. Mchugh[6]on behalf of On behalf of the PROMPT study group. [1]*Chapel Allerton Hospital, Leeds, United Kingdom*; [2]*Royal National Hospital for Rheumatic Diseases, Bath, United Kingdom*; [3]*University of Oxford, Oxford, United Kingdom*; [4]*University College Dublin, Dublin, Ireland*; [5]*University of Nottingham, Nottingham, United Kingdom*; [6]*University of Bath, Bath, United Kingdom*

Background: Psoriatic Disease (PsD) is a chronic inflammatory disease of the skin, nails, joints, and entheses. A number of composite disease activity measures have been developed though there is yet consensus as to which to use in the clinic and in clinical trials. A patient completed disease flare questionnaire, covering multiple domains of disease impact, has been developed but has yet to be fully validated.

Objectives: To validate the FLARE questionnaire in PsD.

Methods: The 10 question FLARE instrument[1] was administered to 141 patients in an observational study of treatment change in PsD over 6 months follow up. Disease activity was measured by the PASDAS and the gold standard of flare

was based on patient opinion. ROC curve was constructed to examine the optimum cut-off for disease flare. Agreement between the FLARE instrument and patient opinion was assessed by Cohen's kappa. Test-retest was assessed in 28 patients with stable disease who underwent repeat assessment within 2 weeks and evaluated by intra-class correlation coefficient (ICC).

Results: The FLARE questionnaire was administered at 367 patient encounters. ROC analysis indicated that the optimum cut-off for a flare of disease was 4 (sensitivity 82%, specificity 76%; area under curve 0.85: figure). Mean PASDAS scores were 2.7 and 6.3 for no-flare (4) and flare (≥4) respectively (p = < 0.0001). For those patients who were having a flare the frequency of response to each question is given in the table. Agreement between patient opinion and questionnaire was 0.57, and between patient opinion and physician (based on treatment escalation) 0.43. ICC for the questionnaire was 0.87 (95% CI 0.72 – 0.94).

Conclusion: In PsD a flare represents escalation of symptoms and signs across multiple domains, as measured by the FLARE instrument; a score of 4 or more has external validity both in terms of composite disease activity and overall patient opinion of the state of their condition.

Table FLARE item response for those in flare vs not in flare

Item	FLARE instrument score <4	FLARE instrument score ≥4
	N (%)	N (%)
Worsening Itch	35 (19)	108 (58)
Worsening skin area	27 (15)	91 (49)
Increasing joint pain	34 (19)	161 (86)
Increasing number of tender joints	20 (11)	142 (76)
Decrease in ability to perform activities	3 (2)	81 (43)
Worsening in ability to move easily	8 (4)	126 (67)
Increase in frustration	14 (8)	142 (76)
Worsening in depression	8 (4)	90 (48)
Worsening in feeling of tiredness all the time	37 (21)	148 (79)
Worsening in the number or combination of symptoms from your disease	7 (4)	134 (72)

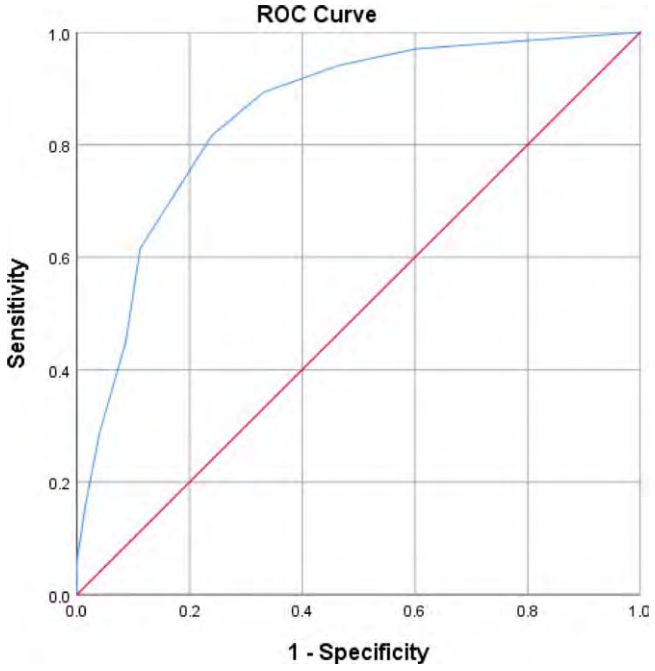

Figure. ROC analysis of FLARE questionnaire

AB1242 A NOVEL BIOMARKER OF MMP-CLEAVED PROLARGIN IS ELEVATED IN PATIENTS WITH PSORIATIC ARTHRITIS COMPARED TO OTHER FIBRO-INFLAMMATORY DISEASES

D. Sinkeviciute[1,2], A. Schlemmer[3], E. Berg Schmidt[3], A. C. Bay-Jensen[1], M. Karsdal[1], J. Hagstrup Christensen[3], S. Kristensen[3], S. Holm Nielsen[1,4]. *[1]Nordic Bioscience, Herlev, Denmark*; *[2]Lund University, Lund, Sweden*; *[3]University of Aalborg, Aalborg, Denmark*; *[4]Technical University of Denmark, Lyngby, Denmark*

Background: Psoriatic Arthritis (PsA) is a chronic inflammatory disease, characterized by involvement of skin, axial and peripheral skeleton. Prolargin is a class II small leucine-rich proteoglycan found to be expressed in connective tissues of patients with PsA, and previously suggested to be remodelled upon treatment. Fragments of prolargin could quantify tissue turnover in individuals with PsA and reflect pathological tissue changes in these patients.

Objectives: This study aimed at developing an immunoassay targeting a neo-epitope of prolargin cleaved by matrix metalloproteinases (MMPs), named PROM; and measure PROM levels in serum from two cohorts of patients affected by PsA and healthy controls.

Methods: Development of a novel immunoassay targeting a specific MMP-generated neo-epitope fragment of prolargin (PROM) together with technical validation was performed, and then evaluated in serum from two independent cohorts. The technical validation included inter- and intra-variation, linearity, spiking recovery, stability and specificity. Specificity was tested using an elongated peptide, a truncated peptide and a non-sense peptide. The Discovery Cohort consists of 13 healthy individuals and 11 PsA patients, mean age 58, 60.3% female and 100% caucasian. The Validation Cohort included 35 healthy individuals and 112 PsA patients with low disease activity included in a 24-week randomized, double-blind, placebo-controlled trial of 3g n-3 polyunsaturated fatty acids (PUFA), a cohort of patients diagnosed with PsA by the CASPAR criteria. These patients had a mean age of 50.8, 57.8 % female and 100 % caucasian. Clinical variables and serum samples were collected at baseline and after 24 weeks of follow-up. An unpaired t-test was used for evaluation of healthy individuals and patients affected by PsA, while a paired t-test was used for evaluation of treatment at baseline and after 24 weeks.

Results: A technically robust and specific assay was developed. The inter- and intra-assay variation of PROM was determined as 14% and 4 % respectively. PROM showed a good dilution recovery, spiking recovery, and storage /freeze-thaw stability (All, 100%±20%). PROM showed to be specific towards the targeted sequence, and did not show any reactivity towards the truncated peptide, elongated peptide or non-sense peptide. In the Discovery Cohort, serum levels of PROM were increased in patients with PsA compared to healthy individuals (p=0.032, Figure 1A). This increase was confirmed by the Validation Cohort, where PsA patients were significantly increased compared to healthy individuals at baseline (p=0.002, Figure 1B). After 24 weeks, the levels of PROM were unchanged in the n-3 PUFA treated group.

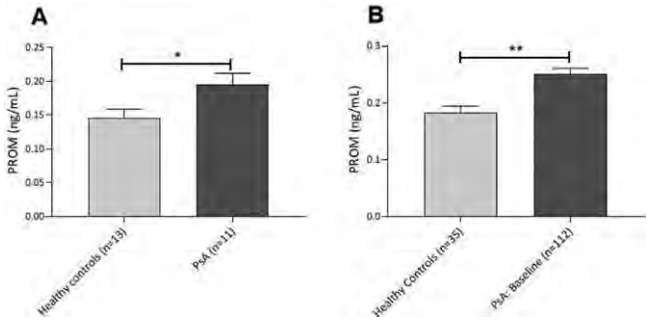

Figure 1.

Conclusion: The novel biomarker PROM, reflecting connective tissue remodeling, is elevated in PsA patients compared to healthy controls in two independent cohorts. No significant association was found for PROM in a low disease activity group of PsA patients treated with n-3 PUFA.

AB1243 TRAINING AND VALIDATION OF A MULTIVARIATE PREDICTOR OF RISK OF RADIOGRAPHIC PROGRESSION FOR PATIENTS WITH RHEUMATOID ARTHRITIS

T. Huizinga[1], M. E. Weinblatt[2], N. Shadick[2], C. Heegaard Brahe[3], M. Østergaard[3], M. L. Hetland[3], S. Saevarsdottir[4], M. Horton[5], B. Mabey[5], D. Flake[5], R. Ben-Shachar[5], E. Sasso[6], A. Gutin[5], E. Hitraya[6], J. Lanchbury[5], J. Curtis[7]. [1]*Leiden University, Leiden, Netherlands*; [2]*Brigham and Women's Hospital, Boston, United States of America*; [3]*Center for Rheumatology and Spine Diseases, Rigshospitalet, Glostrup, and Department of Clinical Medicine, University of Copenhagen, Copenhagen, Denmark*; [4]*Rheumatology Unit, Department of Medicine, Solna and Institute of Environmental Medicine, Karolinska Institutet, Stockholm, Sweden*; [5]*Myriad Genetics, Inc., Salt Lake City, United States of America*; [6]*Crescendo Bioscience, Inc., South San Francisco, United States of America*; [7]*University of Alabama at Birmingham, Birmingham, United States of America*

Background: The multi-biomarker disease activity (MBDA) score, adjusted for age, sex and adiposity ($MBDA_{adj}$), has been shown to be better than several conventional disease activity measures for predicting risk for radiographic progression (RP) in patients with rheumatoid arthritis (RA).[1] Serologic status and other non-disease activity measures are also predictive of RP risk. Combining them with the $MBDA_{adj}$ should result in a stronger prognostic test for RP than any one measure alone.
Objectives: Develop a multivariate model for predicting risk for RP that includes the adjusted MBDA score and other known predictors of RP.
Methods: Four RA cohorts were used, two for training (OPERA and BRASS, n=555) and two for validation (SWEFOT and Leiden, n=397). Each pair of cohorts was heterogeneous in disease duration and treatment history. BMI data were not available for one validation cohort, so a BMI surrogate was modeled using forward selection with the two training cohorts and 3 others (CERTAIN, InFoRM, RACER) (N=1411). An RP risk score was then trained using forward selection in a linear mixed-effects regression, considering disease-related and demographic variables as predictors of change in modified total Sharp score over one year (ΔmTSS), with a random effect on cohort. The RP risk score was validated as a predictor of RP with two cutoffs (ΔmTSS >3 and >5) using logistic mixed-effects regression. Odds ratios (OR) and 95% profile likelihood-based confidence intervals (CI) were calculated from the models and significance was assessed by likelihood ratio tests. Risk curves were generated to show probability of RP as a function of the RP risk score.
Results: The BMI surrogate included leptin, sex, age and age^2 and correlated well with BMI ($\rho = 0.76$). In training, the most significant independent predictors of RP were $MBDA_{adj}$ ($p = 0.00020$), seropositivity ($p = 9.3 \times 10^{-5}$), BMI surrogate score ($p = 0.013$) and use of targeted therapy ($p = 0.0026$). The final model was: RP risk score = 0.024 x $MBDA_{adj}$ + 0.093 if seropositive – 0.063 x BMI surrogate score – 0.61 if using a targeted therapy. In validation, the OR (95% CI) of the RP risk score for predicting ΔTSS >3 or >5 were 2.2 (1.6, 3.2) ($p = 2.6 \times 10^{-6}$) and 3.1 (2.0, 5.0) ($p = 5.7 \times 10^{-8}$), respectively (Figure 1). The odds of a patient having RP increases by 50% for each 21-unit or 15-unit increase in $MBDA_{adj}$, for RP defined as ΔTSS >3 or >5, respectively.

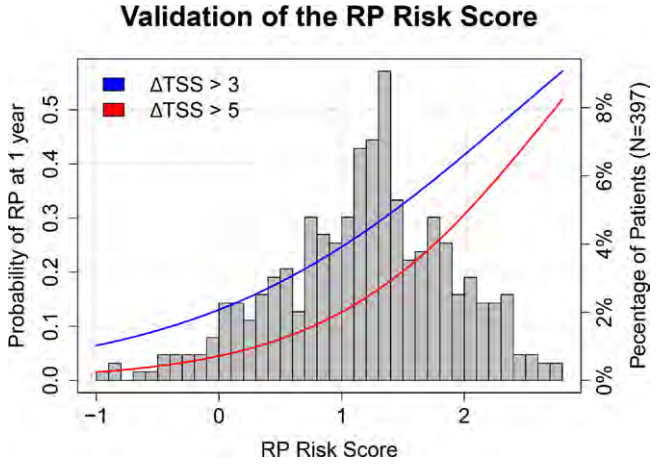

Figure 1.

Conclusion: A multivariate model containing adjusted MBDA score, seropositivity, a BMI surrogate and use of targeted therapy has been trained and validated as a prognostic test for radiographic progression in RA.

AB1244 PROGNOSTIC FACTORS IN IGG4-RELATED DISEASE: A LONG-TERM MONOCENTRIC CHINESE COHORT STUDY

Z. Ji[1], L. Ma[1], L. Zhang[1], L. Ma[1], D. Liu[1], Y. Sun[1], X. Kong[1], X. Dai[1], R. Chen[1], H. Chen[1], L. Jiang[1]. [1]*Zhongshan Hospital, Fudan University, Shanghai, China*

Background: Through initial response to treatment with GC, the patients with IgG4-related disease (IgG4-RD) exhibited high relapse rate after reduction or withdrawal of GC treatment, indicated the unsatisfactory prognosis for IgG4-RD. It is of clinical significance to develop new informative risk factors for refractory and relapsed disease.
Objectives: To evaluate the prognosis of IgG4-RD and identify predictive factors for treatment resistance and disease relapse in a Chinese cohort.
Methods: 102 patients newly diagnosed with IgG4-RD were followed for 6-111 months. Clinical data were compared between patients whose disease went into remission and those who suffered refractory or relapsed disease. Predictive factors for refractory and relapsed disease were calculated by univariate analysis.
Results: Among the 78 patients who received medical treatment with regular follow-up, 55 (59.8%) patients sustained clinical remission, and 23 (25%) patients suffered refractory or relapsed disease. The mortality and incidence of malignancy were both 4.35% during follow-up. Serum TNF-α ≥ 13 pg/ml, sIL-2R ≥ 1010 pg/ml, TC < 3.55 mmol/L, LDL < 2.0 mmol/L, IgG > 20.2 g/L, GC withdrawal, and treatment without immunosuppressor (IM) during the maintenance period (OR 3.23) were predictive factors for refractory and relapsed IgG4-RD. The combination of GC and IM treatment was protective (OR 0.338) against refractory and relapsed IgG4-RD.
Conclusion: Serum TNF-α, sIL-2R, LDL, TC, IgG, GC withdrawal, and treatment without IM during the maintenance period were predictive factors for refractory and relapsed IgG4-RD. Treatment with GC and IM may protect against refractory and relapsed IgG4-RD.

AB1245 DAILY MANAGEMENT OF PATIENTS WITH AXIAL SPONDYLOARTHRITIS: SELF-MONITORING OF DISEASE ACTIVITY WITH A SMARTPHONE APP IS FEASIBLE – A PROOF OF CONCEPT STUDY

U. Kiltz[1], R. Kempin[1], A. Schlegel[1], X. Baraliakos[1], S. Tsiami[1], B. Buehring[1], D. Kiefer[1], J. Braun[1] on behalf of n/a. [1]*Rheumazentrum Ruhrgebiet Herne and Ruhr University Bochum, Herne, Germany*

Background: Assessment and monitoring of disease activity and functioning is of major importance for the course of axial spondyloarthritis (axSpA). This is equally important for patient monitoring in daily routine as also for tight control strategies. Even though there is evidence that a closer monitoring of patients is better than routine care, more intensive treatment schedules are often not realized in daily practice for several reasons including shortage of time and personal resources. Using application software devices (apps) in clinical routine for the recording of disease-specific patient reported outcomes (PRO) may facilitate monitoring and improve clinical decision processes but there is a lack of data on the use of apps.
Objectives: To investigate the use of such App technology in respect to usability, feasibility and equivalence of data in daily care of patients with axSpA. In more detail, it will be first determined how many patients are capable and ready to use the technology in a routine setting. Furthermore, the usage and behavior of patients using the app will be studied, the usability of the app and the equivalence of the collected parameters as well as the adherence to the documentation of disease activity over time.
Methods: Patients diagnosed with axSpA were consecutively included in this ongoing monocentric prospective cohort study. In addition to patient and disease characteristics, information on previous experience with digital health apps was collected. Patients were asked to submit BASDAI and BASFI scores regularly every 2 weeks. The free to use AxSpA Live App is available for Android and iOS as a Class I certified medical device.
Results: Out of 103 axSpA patients asked, 69 patients with axSpA (mean age 41.5 ± 11.3, 58% male, 76.8% use of bDMARDs, BASDAI 4.3 ± 2.0, BASFI 3.8 ± 2.5) out of 103 patients (67%) agreed to use participate, while 5 did not have a smartphone, 1 was unable to download the app for technical reasons, 28 reported other personal reasons). Of the 69, 62 patients (89.9%) reported using electronic media frequently and had used digital health apps (mean apps used 1.0 ± 1.3) in everyday life before. There were no systematic differences between pain levels documented on paper or by app at baseline (ICC 0.9 (95%CI 0.82 – 0.93). Out of 55 patients who completed week 2, only 33 patients (60%) used the App regularly to transmit their BASDAI/BASFI responses within the first two weeks (60%). Patients who started a new drug treatment because of high disease activity, reported BASDAI values more often than patients without a treatment change within a follow-up period of 5.5± 2.4 weeks (Table).

	Patients without change in their medication (n=53)	Patients with change in their medication (n=16)
Age, years	42.0 (11.9)	39.8 (9.3)
Sex, male (%)	62.3	43.8
BASDAI, baseline	4.1 (2.1)	4.9 (1.7)
BASFI, baseline	3.8 (2.6)	3.8 (2.3)
Time of follow-up, in weeks	5.4 (2.4)	5.6 (2.5)
Number of transmitted BASDAI values at week 2	22 (41%)	11 (69%)
Median number of transmitted BASDAI values during follow up	1.0(3.6)	1.5 (1.4)

Conclusion: The majority of patients with axSpA were able to use the AxSpA Live App. Most patients report scores regularly. The current disease activity seems to influence the adherence to reporting.

AB1246 IDENTIFICATION OF GIANT CELL ARTERITIS IN REAL-WORLD DATA USING AN ADMINISTRATIVE CLAIMS-BASED ALGORITHM

H. Lee[1], S. Chen[1,2], S. Tedeschi[2], P. Monach[2], J. Liu[1], A. Pethoe-Schramm[3], V. Yau[4], S. Kim[1,2]. [1]*Brigham and Women's Hospital, Division of Pharmacoepidemiology & Pharmacoeconomics, Boston, United States of America*; [2]*Brigham and Women's Hospital, Division of Rheumatology, Immunity and Inflammation, Boston, United States of America*; [3]*F. Hoffmann-La Roche, Basel, Switzerland*; [4]*Genentech, San Francisco, United States of America*

Background: Giant cell arteritis (GCA), the most common systemic vasculitis in adults, is often associated with significant morbidity and mortality. A claims-based algorithm that accurately identifies GCA patients in large real-world data can offer new opportunities for future epidemiological studies.
Objectives: We aimed to develop and validate a claims-based algorithm for GCA.
Methods: We developed and tested 5 claims-based GCA algorithms using U.S. Medicare claims (Parts A/B/D) linked to electronic medical record data from a large academic medical center, 2006-2014: **Algorithm 1)** ≥1 International Classification of Diseases, Ninth Revision (ICD-9) code for GCA (446.5x) by any physician, high dose steroid dispensing (i.e., prednisone equivalent ≥40 mg/day for ≥14 days), and ≥1 Current Procedural Terminology (CPT) code for ESR/CRP; **2)** ≥1 ICD-9 for GCA by a rheumatologist, high dose steroid dispensing, and ESR/CRP; **3)** ≥2 ICD-9 for GCA by a rheumatologist separated by 7-30 days and high dose steroid dispensing; **4)** ≥1 ICD-9 for GCA by a rheumatologist, high dose steroid dispensing, ESR/CRP, and CPT code for temporal artery biopsy; and **5)** ≥1 ICD-9 for GCA or its subtypes (447.6, 437.4, 417.8) by a rheumatologist, high dose steroid dispensing, ESR/CRP, and CPT code for chest imaging. For all algorithms, the index date was defined as the date of first steroid dispensing. Two physicians reviewed medical records for the gold standard definition of GCA: documentation of GCA by the treating physician or a temporal biopsy result consistent with GCA. Probable GCA cases based on treating physician's records were included as well. Positive predictive value (PPV) and 95% confidence intervals (CI) of the algorithms were calculated.
Results: We identified 1,930 patients with Medicare claims data linked to electronic medical records. Among these, 799 unique records with physician notes

documenting GCA or biopsy results were included in the PPV calculations. Algorithm 1, which identified the greatest number of patients (n=896), yielded the lowest PPV of 60.7%. Algorithms 4 and 5, which required disease-specific workups (temporal artery biopsy or chest imaging), mildly improved the PPV to 76.2% and 68.2%, respectively. The PPV was highest in algorithm 3 (84.8%), which required 2 or more diagnoses of GCA by a rheumatologist in addition to high dose steroid dispensing.

Table. PPV of Claims-based Algorithms

	No. of patients			
Algorithm #	**Records Identified**	**Records Reviewed**	**Adequate Records**	**PPV* (95% CI)**
1	896	446†	206 (46.2%)	60.7% (53.7-67.4)
2	471	471	270 (57.3%)	78.6% (73.2-83.3)
3	220	220	125 (57.4%)	84.8% (77.3-90.6)
4	296	296	172 (58.1%)	76.2% (69.1-82.3)
5	47	47	26 (55.3%)	68.2% (48.2-85.7)

* True positive cases included both definitive and probable GCA patients
†446 records were randomly selected for chart review.

Conclusion: A claims-based algorithm including two or more diagnosis codes for GCA by a rheumatologist separated by 7-30 days and high dose steroid dispensing (prednisone equivalent ≥40 mg/day for ≥14 days) can be a useful tool for identifying patients with GCA, allowing for future large real-world data studies.

AB1247 ELEVATED SERUM COMPLEMENT (C3/C4) LEVEL AS AN INFLAMMATORY MARKER FOR INFECTION IN PATIENTS WITH FEVER: A RETROSPECTIVE STUDY

Z. Y. Li[1], J. Saleh[2], S. Huang[1], M. Elhassan[3], C. Yuvienco[4]. [1]*University of California, San Francisco Fresno, Internal Medicine, Fresno, United States of America*; [2]*A.T. Still University School of Osteopathic Medicine, Mesa, United States of America*; [3]*St. Agnes Medical Center, Internal Medicine, Fresno, United States of America*; [4]*UCSF Fresno, Rheumatology, Fresno, United States of America*

Background: The functions of the complement system are to protect the host against infection, clearance of immune complexes, and regulate adaptive immunity after activation by C-reactive protein (CRP) or foreign cells.[1] C3 and C4 may increase up to 50 percent of baseline values as part of the acute-phase response, which is an expected host response for infection and injury.[2]

Objectives: We aimed to examine the correlation between elevated C3/C4 levels and the underlying causes (infectious vs. non-infectious) of fever (subjective and/or objective) in adults admitted to Community Regional Medical Center (CRMC).

Methods: This is a retrospective study of C3/C4 level that was ordered in adult patients who were admitted to CRMC in April 1st, 2018 to September 30th, 2018 with fever. This was also analyzed in comparison to elevated lactic acid, erythrocyte sedimentation rate (ESR), and CRP level.

Results: Complement levels were ordered in 210 patients admitted to CRMC medicine or intensive care units. Among these patients, 28.09% (59/210) were diagnosed with various infectious diseases confirmed by gold standard methods (cultures, serology tests, computerized tomography, or magnetic resonance imaging), regardless of fever status during admission.

About 26.6% (56/210) had subjective or objective (temperature greater than100.4 F or above), and **52** of them had complement levels (C3/C4) ordered with resulted in either normal or elevated. Within these **52** patients, lactic acid, ESR, and CRP were ordered in **33**, **28**, **25** of them respectively.

Table 1. Elevated C3/C4 level vs. normal C3/C4 level in detecting infection in fever patients when tested against gold standards.

	Patients with infectious disease diagnosis	**Patients without infectious disease diagnosis**	
Elevated C3 or C4 or both (screen test +)	13	7	Positive predictive value (PPV) =13/20=65%
Both normal C3 and C4 (screen test -)	8	24	Negative predictive value (NPV) =15/32=48.9%
	Sensitivity=13/21=61.9%	Specificity=24/31=77.4%	

Table 2. Sensitivity, specificity, PPV, NPV, likelihood ratio positive (LR+), and likelihood ratio negative (LR-) among C3/C4, lactic acid, ESR, CRPI/CRPH in detecting infection in patient with fever

	C3/C4 (N=52)	**Lactic Acid (N=33)**	**ESR (N=28)**	**CRPI/CRPH (N=25)**
Sensitivity	61.9%	50%	90%	100%
Specificity	77.4%	91.3%	11.1%	11.8%
PPV	65%	71.4%	36%	34.8%
NPV	48.9%	80.8%	66.6%	100%
LR+	2.7	5.7	1.0	1.1
LR -	0.49	0.55	0.9	0

Conclusion: Complement levels can be used as a rapid screening test to guide infection consideration as it correctly identified 61.9 % of febrile patients with infection, and 77.4% who didn't have an infection. A positive screening test in itself still requires further investigation in the causes of fever to confirm the diagnosis since the PPV is 65%. With the NPV of 48.9%, a negative screening test is still not reassuring that the febrile patient doesn't have an infection. Our study demonstrated the potential utilization of the elevated complement level as an inflammatory marker for infectious etiology of fever, as it has better LR+ when compares to ESR and CRP with similar turnaround time.

This study helps educate providers to acknowledge the fact that complement level does not have to be limited to be used on autoimmune related disorders only. Further large pool studies will be necessary to further investigate the role of complement levels as part of the screening test in a patient with fever.

AB1248 MOLECULAR MARKERS OF PAIN AND OTHER SYMPTOMS IN KNEE OSTEOARTHRITIS

Y. Liem[1], A. Judge[1,2], K. Ourradi[1,2], Y. Li[1], M. Sharif[1,2]. [1]*University of Bristol, Bristol, United Kingdom*; [2]*University of Bristol, Musculoskeletal Research Unit, Bristol, United Kingdom*

Background: Osteoarthritis (OA) is one of the leading causes for disability in adults. The diagnosis of OA is generally based on patient reported pain, other symptoms and radiographic changes which occur in late stages. There have been extensive research over the last 30 years to identify and validate molecular markers for early diagnosis of OA and a large range of potential biomarkers has been identified[1, 2]. However, most of these biomarkers are markers of structural and metabolic changes, and have poor correlation with pain and stiffness in knee OA. The publicly available data from the National Institute of Health Osteoarthritis Initiative (OAI) provides an opportunity to search for clinically useful biomarkers associated with the main symptoms in OA.

Objectives: To identify molecular biomarkers which are associated with the main symptoms of knee OA.

Methods: 600 participants from 4791 men and women aged 45 to 79 who were Kellgren & Lawrence grade 1 or more were identified with biochemical markers data, radiographic and clinical features of OA. Nineteen biochemical markers measured in serum and/or urine were analysed for their association with primary clinical features of OA: Knee injury and Osteoarthritis Outcome Score (KOOS) pain and symptoms, and Western Ontario and McMaster Universities Osteoarthritis Index (WOMAC) pain and stiffness score. Patient level analysis

was carried out based on the worst affected knee. The association of molecular biomarkers with KOOS and WOMAC scores were assessed using univariate and multivariate linear and logistic regression, and receiving operator characteristic curves (ROC). Area under the curve (AUC) was calculated in order to determine if a combination of the biomarkers improve the associations with the outcome variables.

Results: Only 3 of the 19 biomarkers investigated were associated with clinical symptoms. Serum cartilage oligomeric matrix protein (COMP) and chondroitin sulphate 846 (CS846) were associated with WOMAC pain and stiffness respectively, while, urinary C-terminal crosslinked telopeptide of type II collagen (CTXII) appeared to be highly associated with WOMAC stiffness, KOOS pain and symptoms (Table 1 / 2). The AUC from the univariate model for the association of biomarkers with WOMAC pain and stiffness were 0.5 (Table 1), while the AUC for unadjusted and adjusted multivariate model for the 3 biomarkers combined were 0.56 and 0.67 respectively (Figure 1).

Table 1. Univariate logistic regression model.

	WOMAC Pain		WOMAC Stiffness	
Biomarkers	**OR (95%)**	**AUC (p-value)**	**OR (95%)**	**AUC (p-value)**
sCS846	1.0026 (0.9996, 1.0056)	0.5200 (0.088)	1.0047 (1.0013, 1.0081)	0.5399 (0.007)
sCOMP	0.9419 (0.8912, 0.9954)	0.5462 (0.034)	1.0424 (0.9843, 1.1039)	0.5317 (0.156)
uCTXII	1.0077 (0.9990, 1.0165)	0.5300 (0.083)	1.0099 (1.0005, 1.0194)	0.5489 (0.039)

Conclusion: Serum COMP and urinary CTXII are associated with pain in knee OA, while serum CS846 and urinary CTXII are associated with joint stiffness. The multivariate logistic regression model shows good discrimination for the association of biomarkers with clinical symptoms of OA. The data from the multivariate model suggests that a clinically useful biomarker may be created using AUC values for better specificity and sensitivity.

AB1249

ASSESSMENT OF FATIGUE IN ADULTS WITH MODERATE-TO-SEVERE SYSTEMIC LUPUS ERYTHEMATOSUS (SLE): A QUALITATIVE STUDY TO EXPLORE WHAT PATIENTS FEEL SHOULD BE MEASURED IN CLINICAL TRIALS

S. Mannix[1], A. Beyer[2], V. Strand[3], L. Hanrahan[4], C. Abél[1], B. Flamion[2], A. Hareendran[5]. [1]*Evidera, Bethesda, United States of America*; [2]*Idorsia Pharmaceuticals, Allschwil, Switzerland*; [3]*Stanford University, Palo Alto, United States of America*; [4]*The Lupus Foundation of America, Washington, D.C., United States of America*; [5]*Evidera, London, United Kingdom*

Background: Fatigue is one of the most common symptoms reported by patients with systemic lupus erythematosus (SLE)—it is responsible for considerable loss of work time and greatly impaired quality of life. The Functional Assessment of Chronic Illness Therapy-Fatigue (FACIT-F) has been used to assess fatigue in SLE clinical trials[1]; however, assessment of the content validity of the FACIT-F in adults with SLE suggested that closer evaluation may be warranted.[2]

Objectives: This qualitative study aimed to understand SLE patients' experience of fatigue and assess the content validity of the FACIT-F.

Methods: The evaluation was informed by literature and guided by a project steering committee (PSC; patient advocate, clinical expert, outcomes measure expert). The institutional review board-approved study involved focus groups (Round 1) and cognitive interviews (Round 2) with adults with moderate-to-severely active SLE. All participants provided written informed consent. Round 1 included three focus groups to understand the disease and fatigue-related concepts that were most important to patients; participants also provided high-level feedback on the FACIT-F. Round 2 included 13 one-on-one cognitive interviews on the relevance of content, clarity, and comprehensiveness of the FACIT-F. Interviews were audio-recorded and transcribed and a content analysis was completed. The PSC reviewed results and contributed to decision-making. Specific focus was on determining patient understanding of the FACIT-F, comprehensiveness, and any gaps in concept coverage to evaluate fatigue in the context of a clinical trial.

Results: Twenty-eight patients with moderate-to-severely active SLE participated; they were mostly female (n=27), had a mean age of 45.5 ± 12.1 years (range: 18–75), and 23 (82%) had moderate and five (18%) severely active SLE. All participants were receiving SLE treatment, and most (n=23, 82%) reported fatigue among their top three most important SLE-related symptoms. Fatigue was described as having a profound impact on daily life, including ability to perform chores and work-related activities, maintain personal hygiene, exercise, and participate in hobbies. Study participants reported the FACIT-F covered concepts most relevant to their fatigue experience. Participants were able to understand the FACIT-F instructions, items, and response options and felt the recall period of seven days was appropriate.

Conclusion: Fatigue was one of the most important symptoms, having a significant impact on adults with moderate-to-severely active SLE, limiting their ability to perform necessary or desired activities. The FACIT-F was found to be an appropriate measure for the assessment of fatigue in this sample.[3] Evidence of the content validity of the FACIT-F in adults with SLE was confirmed for use to support endpoints in the Cenerimod Assessing $S1P_1$ Receptor Modulation in SLE (CARE) clinical trial.

AB1250 DIAGNOSTIC SIGNIFICANCE OF THE PROCALCITONIN TEST IN RHEUMATOLOGY

N. Muravyeva[1], B. Belov[1], G. Tarasova[1], M. Cherkasova[1]. [1]*V.A. Nasonova Research Institute of Rheumatology, Moscow, Russian Federation*

Background: Immuno-inflammatory rheumatic diseases (IIRDs) are often complicated by the infectious process, which may be due to both the disease itself and immunosuppressive therapy. At the same time, clinical symptoms and traditional laboratory tests are often uninformative in patients with active IIRDs, and negative results of bacteriological research do not exclude the presence of infection. One of the markers of bacterial inflammation – the procalcitonin test (PCT) - can play an important role in the early detection of infection in IIRDs.
Objectives: The aim of the study is to assess the diagnostic significant of PCT in rheumatology.
Methods: The study included 340 patients (227 women, 113 men, age 39.1±20.8 years) with different IIRDs: systemic lupus erythematosus (SLE) – 74, rheumatoid arthritis (RA) - 71, juvenile arthritis (JA) - 53, systemic vasculitis (SV) - 33, systemic scleroderma (SSD) - 27, ankylosing spondylitis (AS) - 18, adult-onset Still's disease (AOSD) - 13, other IIRDs - 51. The serum concentration of PCT was determined by the quantitative electrochemiluminescent method using the Cobas E 411 analyzer (Roshe, Switzerland).
Results: In patients without infection (n=181), the median (Me) PCT level was 0.11 ng/ml [0.05; 0.17]; higher values of PCT were found in patients with AOSD (0.39 ng/ml [0.14; 0.51]), systemic form of JA (0.17 ng/ml [0.11; 0.5]) and SLE (0.16 ng/ml [0.10-0.45]). In RA, SV, SSD, AS without infection, Me PCT was 0.07 ng/ml [0.03; 0.12]. The infectious process was detected in 159 patients: generalized - in 11, local - in 148. Depending on the severity of the intoxication syndrome, local infections are divided into severe (n=70) and light (n=78). Infections of the lower respiratory tract, urinary system, skin and soft tissues prevailed. In patients with generalized infection, Me PCT level was 3.6 ng/ml [0.49; 11.3]. In 10 patients of this group, the level of PCT exceeded 2 ng/ml, in 5 patients - 10 ng/ml. In severe local infection, Me PCT was 0.45 ng/ml [0.23; 1.19], in light - 0.12 ng/ml [0.05; 0.16]. In generalized infection, the level of PCT was significantly higher than in patients without infection ($p<0.0001$), as well as with mild ($p<0.0001$) and severe local infection ($p<0.0001$). In patients with severe local infection, the level of PCT was higher compared to patients without infection ($p<0.0001$) and with mild local infection ($p<0.001$). There were no significant differences in PCT in the groups of patients with light local infection and without infection. In SLE patients with infection, the level of PCT and CRP (but not ESR) was higher than in patients without infection; a correlation was found between the level of PCT and CRP ($r=0.53$, $p<0.001$) in the presence of infection. In AOSD, systemic form of JA, RA, SV, SSD, AS, significant differences in the levels of PCT, ESR, CRP in patients with infection and without infection were not obtained, correlations were not revealed. According to the ROC-analysis, the diagnostic significance of determining PCT in generalized infection is excellent, in severe local infection - very good, and in differentiation of generalized infection from local infection - very good.
Conclusion: PCT is a significant diagnostic test that allows to recognize generalized and severe local infections in patients with IIRDs. In order to more accurately diagnose the infectious process, a multi-marker approach is needed.

AB1251 VALIDITY OF RHEUMATOID ARTHRITIS DIAGNOSES IN FINNISH BIOBANK PATIENTS

A. Palomäki[1,2], J. Paltta[1], L. Pirilä[1], H. K. Heikkilä[3], P. Isomäki[3,4], J. Huhtakangas[5], T. Sokka-Isler[6], O. Kaipiainen-Seppänen[5], K. Eklund[7]. [1]*Turku University Hospital and University of Turku, Centre for Rheumatology and Clinical Immunology, Turku, Finland*; [2]*Helsinki University, Helsinki, Finland*; [3]*Tampere University Hospital, Centre for Rheumatology, Tampere, Finland*; [4]*Tampere University, Faculty of Medicine and Health Technology, Tampere, Finland*; [5]*Kuopio University Hospital, Kuopio, Finland*; [6]*Jyväskylä Central Hospital, Jyväskylä, Finland*; [7]*Helsinki University Hospital, Helsinki, Finland*

Background: Finnish healthcare registers are used in medical research, but there is little data about the validity of these registers in rheumatology.
Objectives: The aim of our study was to determine the validity of rheumatoid arthritis (RA) diagnoses in patients participating in the Finnish Biobanks.
Methods: We reviewed the electronic patient charts of 125 patients with at least one visit with a diagnosis of seropositive RA, 125 patients with at least one visit with a diagnosis of seronegative RA and 250 age-and-sex matched controls. Patients were randomly selected from Finnish biobank participants. We evaluated whether the patients' diagnosis of RA recorded in the hospital discharge registry at the participating hospital was correct according to chart review and expert opinion. In the control group it was investigated whether the diagnosis of RA was written in the patients' chart, but the diagnosis code was not recorded.
Results: The positive predictive value (PPV) of a single hospital registry diagnosis of seropositive RA was 0.74 but rose to 0.98 in patients with a special reimbursement for seropositive RA and 0.98 in anti-citrullinated protein antibody positive patients. For seronegative RA, the PPV of a diagnosis was 0.72 and in patients with a special reimbursement for seronegative RA 0.89. The PPV was higher in patients with more than one visit with the diagnosis: 0.92 if the patients had at least 5 visits with seropositive RA and 0.88 with at least 5 visits with seronegative RA. Negative predictive value for RA diagnosis was 0.99.
Conclusion: These results demonstrate that the validity of RA diagnoses in healthcare registers can be markedly improved with data about special reimbursement for medication, number of visits and serological data.

AB1252 CAN THE HUPI BE MORE USEFUL THAN OTHER INDICES IN THE SEARCH OF BIOMARKERS FOR RA?

S. C. Rodriguez-García[1], N. Montes[1], J. Ivorra[2], A. Triguero-Martinez[1], L. Rodriguez Rodriguez[3], I. Castrejon[4], L. Carmona[5], I. González-Álvaro[1]on behalf of the PEARL and ACT-RAY Working groups. [1]*Hospital de La Princesa, Madrid, Spain*; [2]*Hospital La Fe, València, Spain*; [3]*Hospital San Carlos, Madrid, Spain*; [4]*Hospital Gregorio Marañón, Madrid, Spain*; [5]*InMusc, Madrid, Spain*

Background: The Hospital Universitario La Princesa Index (HUPI) was developed to tackle metric shortcomings of DAS28 and SDAI, and has shown better accuracy and responsiveness than these widespread indices.[1]
Objectives: To compare the performance of HUPI, DAS28, and SDAI in explaining the variability of radiographic progression, HAQ and the distribution of a biomarker of damage such as IL6.
Methods: Two cohorts were assembled with data from a clinical trial (ACT-RAY) and an early arthritis register (PEARL). Radiographic progression, measured as the change (Δ) of Genant or Sharp/Van der Heijde indices at week 52 in ACT-RAY and PEARL respectively, Δ HAQ and serum IL6 (ELISA; R&D Systems) levels, the latter only available in PEARL, were the outcome variables. HUPI, DAS28, SDAI, sex and age were the independent variables.
For each index, linear regression models adjusted for sex and age were developed using standardized variables. The overall performance of the model, as well as that of the specific index it included, were evaluated using the adjusted R2. Differences between models were assessed with the likelihood ratio test. Also, The *fpfitci* command (Stata v14) was used to estimate the predicted distribution of the described variables using fractional polynomials and plotting the resulting curves.
Results: The performance of the models and indices are shown in table 1. The variability of radiographic progression was better explained by the SDAI model in ACT-RAY whereas HUPI did it so in PEARL. The latter also performed better for explaining HAQ in ACT-RAY (figure 1) and IL6. Sex modified the performance of DAS28 and SDAI in their respective models. The relation between all the described outcomes predicted using fractional polynomials and each index was also more linear for HUPI than its comparators. (see an example in figure 2).

Table 1. Adjusted R^2 of the models and indices. R^2m: adjusted $R^2$of the models; R^2I: adjusted R^2 of the index included in the model; LR: Likelihood-Ratio test comparing HUPI models vs other indices'.

OUTCOME	INDEX	ACT-RAY		LR	PEARL		LR
		R^2m	R^2I		R^2m	R^2I	
RADIOGRAPHIC PROGRESSION	HUPI	0.025	0.024	ref	0.110	0.020	ref
	DAS28	0.031	0.030	<0.000	0.102	0.011	<0.000
	SDAI	0.051	0.050	<0.000	0.109	0.019	<0.000
HAQ	HUPI	0.353	0.323	ref	0.477	0.448	ref
	DAS28	0.329	0.298	<0.000	0.472	0.442	<0.000
	SDAI	0.334	0.303	<0.000	0.486	0.457	<0.000
IL6	HUPI	-	-	-	0.212	0.184	ref
	DAS28	-	-	-	0.204	0.176	<0.000
	SDAI	-	-	-	0.201	0.172	<0.000

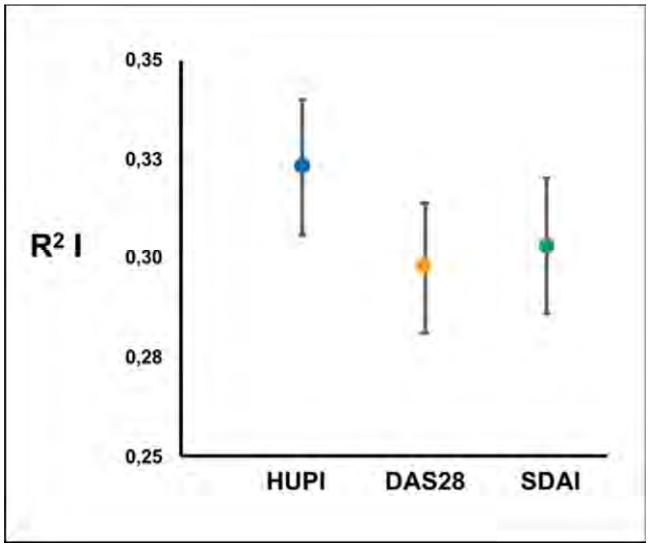

Figure 1. Box plots comparing the adjusted R^2 of each index estimated in models for HAQ in ACT-RAY.

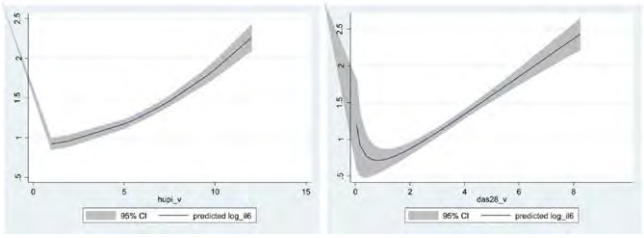

Figure 2. Curves for comparison of predicted serum IL6 using fractional polynomials for HUPI and DAS28.

Conclusion: Although all indices explained the outcomes' variability similarly, HUPI did it better than DAS28 and SDAI for almost all outcomes except for Δ Genant and HAQ in PEARL.

EVALUATION OF CYSTEINE-RICH 61 IN RHEUMATOID ARTHRITIS AS A DIAGNOSTIC MARKER AND PREDICTOR OF ATHEROSCLEROSIS

H. A. Esaily[1], D. M. Serag[2], M. S. Rizk[3], A. Sonbol[4], D. Salem[1]. [1]*Menoufia University, Egypt, Physical Medicine, Rheumatology and Rehabilitation Department, Faculty of Medicine, Shebin El Kom, Egypt*; [2]*Menoufia University, Egypt, Radiology Department, Faculty of Medicine, Shebin El Kom, Egypt*; [3]*Menoufia University, Egypt, Medical Biochemistry and Molecular Biology Department, Faculty of Medicine, Shebin El Kom, Egypt*; [4]*Menoufia University, Egypt, Clinical Pathology Department, Faculty of Medicine, Shebin El Kom, Egypt*

Background: Matricellular protein Cysteine-rich protein 61 (Cyr61) is involved in chronic inflammatory disorders like rheumatoid arthritis (RA) and atherosclerosis.
Objectives: This study aimed to assess the value of serum Cyr61 in diagnosis of rheumatoid arthritis, evaluating its correlation with disease activity and its relation to atherosclerosis.
Methods: Cross-sectional study included 105 RA patients classified into active and inactive groups according to disease activity score (DAS28) with 50 healthy age and gender-matched controls. Full clinical and laboratory assessment was done including enzyme-linked immunosorbent assay (ELISA) measurement of Cyr61. Bilateral assessment of carotid intima-media thickness (CIMT) was done using high resolution-ultrasonography. Comparison of Cyr61 between RA patients and controls, correlation between Cyr61 and disease activity and CIMT were analyzed with appropriate statistical analyses.
Results: Significant elevation of Cyr61 in RA patients compared to controls (235.62±62.5 vs. 73.11±18.2) respectively. The cut off value of Cyr61 was 99.25 pg/ml, with area under the curve (AUC) =0.995, P <0.001, 98 % sensitivity and 95% specificity. Cyr61 was inversely correlated with DAS28 and its components in RA patients (r=- 0.92, r=- 0.94) (p<0.001). There was a significant positive correlation between Cyr61 levels and CIMT in inactive and active RA patients (r=0.88, r=0.47) respectively.
Conclusion: Serum Cyr61 as a potential diagnostic biomarker in RA is inversely correlated with disease activity. High Cyr61 in RA is a risk factor for atherosclerosis. Disruption of serum Cyr61 is engaged in the pathogenesis of both rheumatoid arthritis and atherosclerosis which is a clue for a future treatment strategy of RA.

PHENOTYPING OF MULTIPLE BIOFLUIDS FOR LIQUID BIOMARKERS FOR DIAGNOSTICS AND PERSONALIZED MEDICINE OF RHEUMATOID ARTHRITIS, SPONDYLOARTHRITIS AND OSTEOARTHRITIS

T. B. G. Poulsen[1], J. S. Andersen[1], M. K. Kristiansen[1], S. Rasmusen[2], L. Arent-Nielsen[1], C. H. Nielsen[3], A. Stensballe[1]. [1]*University of Aalborg, Aalborg, Denmark*; [2]*Aalborg University Hospital South, Aalborg, Denmark*; [3]*Rigshospitalet, København, Denmark*

Background: Inflammatory and autoimmune diseases include multifactual pathomechanisms and systemic responses. The etiology of the joint diseases rheumatoid arthritis (RA), spondyloarthritis (SpA) in relation to osteoarthritis (OA) remain incomplete and establishing the correct diagnose remains nontrivial. Advances in high-throughput molecular technologies have increased investigations into the

utility of transcriptomic, proteomic and high-density protein arrays approaches as diagnostic tools and companion diagnostics for precision medicine. To increase our understanding of the molecular pathogenesis, we extracted synovial fluid from the joints from multiple patient groups and characterized the protein composition in relation to plasma. Basic blood tests include inflammatory markers and autoantibodies, however, now analysis speed and robustness allow more readily clinical insight biofluids.

Objectives: We present recent Omics concepts and studies investigating inflammatory state and treatment outcome in different biofluids from plasma to synovial fluid accessing causalities leading to inflammation and pain. Additionally, the aim was to investigate in any proteomic findings in synovial fluid can be correlated to proteomic changes in patient plasma and can be used as biomarkers for treatment effect.

Methods: Plasma and synovial fluid were investigated in multiple pathologies before and after treatment in patients (biologics; MTX; intraarticular gold). Deep proteome, PTM and EV profiling were accomplished using quantitative proteomics approaches using quantitative mass spectrometry-based analysis by DIA/PASEF followed by deep datamining. All biological samples were digested according to a Filter Aided Sample Preparation (FASP) protocol before analysis with tandem mass spectrometry (MS/MS). PTM profiling were evaluated by 4D CCS based feature finding.

Results: Mass spectrometry based profiling allowed quantitative profiling of up to 480 proteins in matched synovial fluid and plasma. Complementary analysis by Olink proteomics, cytokine profiling and cell-free DNA. Multiple acute inflammatory proteins were more abundant in the RA synovial fluid, including proteins originating from neutrophil granulocytes, whereas SpA patients had a higher concentration of haptoglobin. Complementary analysis by Olink immunoassay identified significantly downregulated inflammation markers out of 96 tested in relation to antiinflammatory treatment.

Conclusion: Discovery of biomarkers and/or inflammatory signatures through integration of multi-omic data allowed stratify patients for improved treatment and prognosis. Firstly, our data using next generation proteomics approaches alleviates many pitfalls of missing values and poor proteome coverage including unbiased PTM profiling without enrichment strategies.

AGREEMENT BETWEEN PATIENT-REPORTED OUTCOME MEASURES COLLECTED VIA A SMARTPHONE APPLICATION VS A TOUCHSCREEN SOLUTION IN AN OUTPATIENT CLINIC AMONG PATIENTS WITH INFLAMMATORY ARTHRITIS: A RANDOMISED, WITHIN-PARTICIPANT TRIAL

L. Uhrenholt[1,2,3], R. Christensen[3,4], L. Dreyer[1,5], A. Mortensen[1], E. M. Hauge[6,7], N. Steen Krogh[8], M. K. Abildtoft[8], P. C. Taylor[9], S. Kristensen[1]. *[1]Aalborg University Hospital, Department of Rheumatology, Aalborg, Denmark*; *[2]Rigshospitalet, Glostrup, The DANBIO Registry, Glostrup, Denmark*; *[3]Frederiksberg Hospital, Musculoskeletal Statistics Unit, The Parker Institute, Frederiksberg, Denmark*; *[4]Odense University Hospital, Research Unit of Rheumatology, Department of Clinical Research, University of Southern Denmark, Odense, Denmark*; *[5]University of Aalborg, Department of Clinical Medicine, Aalborg, Denmark*; *[6]Aarhus University Hospital, Department of Rheumatology, Aarhus, Denmark*; *[7]Aarhus University, Department of Clinical Medicine, Aarhus, Denmark*; *[8]Zitelab ApS, Frederiksberg, Denmark*; *[9]University of Oxford, Nuffield Department of Orthopaedics, Rheumatology and Musculoskeletal Sciences, Oxford, United Kingdom*

Background: Patient-reported outcome measures (PROMs) are essential to understand the patient's perception of arthritis activity. In Demark, PROMs are registered on a touchscreen in the outpatient clinic. However, some patients find it inconvenient due to e.g. waiting in queue, lack of privacy, uncomfortable seating position, reduced upper limb strength and dexterity with seeing the touchscreen due to deformity of the cervical spine. The widespread use of smartphones makes it possible for patients to register PROMs via an application (app) on their own device.

Objectives: The primary aim is to evaluate the agreement (i.e. similarity) between the two devices assessed by the Health Assessment Questionnaire Disability Index (HAQ-DI) status among patients with inflammatory arthritis.

Methods: The study was a randomised, crossover, agreement trial (NCT03486613) conducted at Aalborg University Hospital, Denmark. Participants were recruited through an invitation on the touchscreen in the outpatient clinic. Patients with an established diagnosis (≥ 12 months) of rheumatoid arthritis (RA), psoriatic arthritis (PsA) or axial spondyloarthritis (axSpA) and experience with the PROM questionnaires (≥ 3 previous registrations) were enrolled and randomised in ratio 1:1 (stratified by diagnosis) to PROM registration through the DANBIO app and the touchscreen in random order. Figure 1A and 1B shows the two devices.

The sample size calculation was based on a prespecified equivalence margin of ±0.11 HAQ-DI points (i.e. ≤ half of the minimal important difference of 0.22 points) yielding a power of 99.2% for 60 enrolled patients. There was a wash-out period of 1-2 days between the two device registrations to minimise the potential carryover effect.

A paired t-test was used to calculate the mean HAQ-DI score for the two devices and the difference in HAQ-DI score with a 95% confidence interval (CI). A Bland-Altman plot was used to assess limits of agreement (LoA).

Results: 60 patients (20 with RA, 20 with PsA and 20 with axSpA) were randomised of whom 51.7% were male. Mean age was 53.7 years (range 22-77) and mean disease duration was 12.5 years (range 1.0-34.8).

Mean HAQ-DI was 0.608 (95%CI 0.437;0.779) for the DANBIO app and 0.614 (95%CI 0.446;0.783) for the touchscreen (Table 1). Agreement between scores obtained with the two devices is illustrated with Bland-Altman plots in figure 2A and 2B. The paired mean difference of HAQ-DI between the two devices was -0.006 (95%CI -0.0424; 0.030); thus the 95% confidence interval for the mean difference was within the prespecified equivalence margin of ±0.11 HAQ-DI points.

Table 1. HAQ-DI scores, difference and LoA for the two devices.

	App, mean (SD)	Touchscreen, mean (SD)	Difference, mean (95%CI)	LoA	Missing values
HAQ-DI (0-3)	0.608 (0.656)	0.614 (0.646)	-0.006 (-0.042;0.030)	-0.277;0.264	1

Conclusion: The current study showed no statistical or clinically important difference in HAQ-DI measurement captured by a smartphone app or outpatient touchscreen. Therefore, we feel confident that the two devices perform similarly enough to be used interchangeably in patients with inflammatory arthritis.

AB1256 CORRELATION BETWEEN SERUM CALPROTECTIN LEVELS, RAPID3 AND DISEASE ACTIVITY MEASURES IN PATIENTS WITH RHEUMATOID ARTHRITIS

M. Valls Roc[1], O. Codina Guinó[1], M. Sala Gomez[1], S. Castell Quiñones[1], C. Mora Maruny[2]. [1]*Hospital de Figueres, Rheumatology, Figueres, Spain*; [2]*Hospital de Figueres, Clinical Analysis Department, Figueres, Spain*

Background: Tight control of rheumatoid arthritis (RA) is essential and we need a validated, objective and reproducible disease measure to achieve it. There is not gold standard in RA. There is a rising interest in evaluating disease activity on the patient's point of view using patient-reported outcomes like RAPID3. Furthermore, some new biomarkers have appeared, like serum calprotectin, with promising results on its analyzing.
Objectives: To evaluate correlation between disease activity measures usually used in patients with RA (DAS28 ESR/CRP, SDAI and CDAI) and other alternative tools (RAPID3 and calprotectin). To analyze correlation between RAPID3 and serum calprotectin levels.
Methods: A cross-sectional study was performed. RA-patients (n=114) according to the ACR/EULAR 2010 classification criteria were consecutively enrolled from Rheumatology department at Hospital de Figueres during the period from February to June 2019. Disease activity, biomarkers and the assessment of the patient's health status with RAPID3 data were collected. Modified RAPID3 (mRAPID3) was calculated by subtracting the questions about the mood included in the questionnaire (k,l,m questions) to the results of the RAPID3 as if it were a response of the HAQ test. Coefficient Spearman's correlation (r) was used to assess the relationship between the variables, and coefficient of determination (r-squared=r^2 and adjusted r^2) was used to show the strength of correlation.
Results: 114 patients were included: 71% women, mean (SD) age 60(11) years, median disease duration 13(8) years. 80% had positive RF and 70% positive ACCP antibodies. 52% had erosions. 89% patients had been receiving treatment with csDMARDs, 38% with bDMARDs o dsDMARS and 66% with glucocorticoids. Disease activity measures' median values were DAS28ESR 3.07, DAS28CRP 2.76, SDAI 9.62 and CDAI 8.99 and showed low activity. The mean values of RAPID3 y mRAPID3 showed moderate activity (8.95 and 8.68 respectively). Median serum calprotectin level was 1.48µg/ml.
All correlations between variables were statistically significant and directly proportional although with different values (table).

Spearman's correlation coefficient between mRAPID3, serum calprotectin, disease activity scores and laboratory parameters

	mRAPID3	Calprotectin	CRP	ESR	DAS28ESR	DAS28PCR	SDAI	CDAI
mRAPID3	1							
Calprotectin	0.23	1						
CRP	0.33	0.59	1					
ESR	0.23	0.39	0.54	1				
DAS28-ESR	0.62	0.32	0.41	0.62	1			
DAS28-CRP	0.69	0.32	0.42	0.28	0.83	1		
SDAI	0.74	0.31	0.35	0.27	0.82	0.91	1	
CDAI	0.73	0.25	0.24	0.21	0.80	0.89	0.99	1

DAS28: Disease Activity Score, SDAI: Simplified Disease Activity Index, CDAI: Clinical Disease Activity Index, RAPID3m: Routine Assessment of Patient Index Data 3 modificative with k,l,m questions. CRP: C-reactive protein. ESR: erythrocyte sedimentation rate

Coefficient of determination found a weak association between RAPID3 and mRAPID3 with DAS28ESR (r^2=0,38) and moderate with DAS28CRP, SDAI and CDAI (r^2=0,47, 0,55 y 0,53). Determination serum calprotectin levels together with RAPID3 or mRAPID3 increased strength of correlation between DAS28ESR, DAS28CRP, SDAI and CDAI with RAPID3 (adjusted r^2=0,40, 0,49, 0,56, 0,52) and with mRAPID3 (adjusted r^2=0,41, 0,50, 0,56, 0,53). Correlation between RAPID3 and serum calprotectin levels was very weak (r^2=0,05).
Conclusion: Correlation between disease activity measures and mRAPID3 was strong, but it was weak with serum calprotectin levels. Correlation strength between RAPID3 and DAS28ESR was low and it was moderate with other composite indices, it maintained with RAPID3m and improved by adding serum calprotectin levels although modestly. There was a very weak correlation between RAPID3 and serum calprotectin levels suggesting that these two variables give us different information about the disease activity.

AB1257 SCREENING FOR IMMUNOGLOBULIN A ANTIBODY REACTIVITY IN EARLY AXIAL SPONDYLOARTHRITIS IDENTIFIES NOVEL ANTIGENIC TARGETS

P. Vandormael[1], D. Quaden[1], P. Ruytinx[1], J. Janssens[1], J. Vanhoof[2], P. Geusens[1,2,3], V. Somers[1]. [1]*Hasselt University, Biomedical Research Institute, Diepenbeek, Belgium*; [2]*ReumaClinic, Genk, Belgium*; [3]*Maastricht University Medical Center, Internal Medicine, Rheumatology, Maastricht, Netherlands*

Background: Although autoantibodies are not generally considered to be a hallmark of axial spondyloarthritis (axSpA), increasing evidence suggests the presence of autoantibodies in a subset of axSpA patients. Most of these described antibodies are of the immunoglobulin G (IgG) isotype while other antibody isotypes are less well studied. Antibodies of the IgA isotype can be of interest due to the strong link between gut inflammation and spondyloarthropathies.
Objectives: The aim of this study was to identify and characterize novel IgA isotype (auto)antibodies specific for early axSpA patients.
Methods: An axSpA cDNA phage display library, representing the antigenic repertoire from axSpA hip synovium, was constructed and screened for reactivity with IgA antibodies in plasma of early axSpA patients (*n=10*). Using enzyme-linked immunosorbent assays (ELISA), antibody reactivity against 173 identified targets was initially determined in pooled plasma of early axSpA patients (n=60) and healthy controls (HC, *n=30*), collected at Hasselt University. Antigenic targets that showed increased IgA reactivity in axSpA plasma pools were further validated in individual plasma samples of early axSpA patients (*n=79*) and HC (*n=101*).
Results: We identified 10 novel Hasselt University (UH) axSpA peptide targets with increased IgA antibody reactivity in pooled axSpA plasma. At present, validation of 8 UH-axSpA-IgA peptide targets in individual plasma samples revealed antibody reactivity against at least one of these targets in 32% of early axSpA patients (25/79) compared to 26% in HC (31/101, *p=0.4082*). By combining the 3 UH-axSpA-IgA peptides with the highest positive likelihood ratio (LR+) into a panel, an increased overall specificity of 90% (10/101) could be achieved, with an associated sensitivity of 24% (19/79, *p=0.0138*) resulting in a LR+ of 2.4. Antibody reactivity testing of the remaining 2 UH-axSpA-IgA peptide targets is currently ongoing.
Conclusion: The increased reactivity of IgA (auto)antibodies against several novel antigenic peptide targets underscores the role of the humoral immune response in axSpA, and might indicate a potential link with mucosal inflammation. IgA antibody reactivity against these novel peptide targets will be further validated in independent cohorts of early axSpA patients as well as in patients with chronic low back pain.

AB1258 THE VALUE OF THE SQUEEZE TEST FOR DETECTION OF SUBCLINICAL SYNOVITIS IN PATIENTS WITH ARTHRALGIA SUSPICIOUS FOR PROGRESSION TO RA

F. Wouters[1], E. Niemantsverdriet[1], A. Van der Helm - van Mil[1,2]. [1]*Leiden University Medical Centre, Department of Rheumatology, Leiden, Netherlands*; [2]*Erasmus Medical Centre, Department of Rheumatology, Rotterdam, Netherlands*

Background: The squeeze test (or compression test) is often used to quickly screen for arthritis in metacarpophalangeal (MCP)- and metatarsophalangeal (MTP)-joints. A positive test is traditionally assumed to indicate presence of synovitis. Previous studies in early arthritis indeed showed that a positive squeeze test was associated with presence of swollen MCP- and MTP-joints, as well as with local MRI-detected inflammation. The sensitivity of the test, with MRI-detected synovitis as reference, was 31-33%. The field is moving towards identifying patients at risk for rheumatoid arthritis (RA) in the phase of arthralgia. However, it is unclear if the squeeze test in the phase of clinically suspect arthralgia (CSA) is associated with subclinical inflammation, which can be detected with MRI.
Objectives: We aimed to assess if a positive squeeze test in patients with CSA is associated with MRI-detected subclinical inflammation, especially with

subclinical synovitis and tenosynovitis (the latter is recently identified as a strong predictor for RA-development).
Methods: 315 patients with recent-onset (<1 year) arthralgia of small joints and a clinical suspicion for progression to RA were consecutively included in our CSA-cohort. At baseline the squeeze test (compression across the knuckles of MCP- and MTP-joints with the force of a firm handshake) and unilateral contrast-enhanced 1.5T MRI of MCP(2-5)- and MTP(1-5)-joints was performed and scored according to RAMRIS. MRI-scores were dichotomized with data from age-matched symptom-free controls as reference. Follow-up ended when patients developed clinically apparent inflammatory arthritis (IA), or else after 2 years. Associations of the squeeze test and MRI-data were studied with generalized estimating equations, associations with IA-development with cox regression.
Results: 51% of CSA-patients had a positive squeeze test in MCP- or MTP-joints. In univariable analyses a positive test was associated with MRI-detected subclinical synovitis (OR 2.10 (95%CI 1.30-3.40)) and tenosynovitis (OR 1.68 (1.05-2.68)). In multivariable analyses including both inflammatory features only synovitis remained significant (OR 1.90 (1.16-3.13)). Thus, a positive squeeze test is a measure of subclinical synovitis, with a sensitivity of 44% (95%CI 33-55) and specificity of 72% (68-76).
A positive squeeze test in CSA was not associated with IA-development in cox regression adjusted for age, gender, CRP and ACPA-status (HR 1.57 (0.77-3.19). This was consistent with the finding that subclinical synovitis was not associated with IA-development in multivariable analysis adjusted for age, gender, CRP, ACPA-status and tenosynovitis (HR 1.40 (0.59-3.31), whilst tenosynovitis was associated (HR 4.94 (2.03-12.06).
Conclusion: The squeeze test is a simple test that, when positive in CSA, doubles the probability of presence of subclinical synovitis.

Rehabilitation

AB1259 THE IMPACT OF DIFFERENT EXERCISE MODES AND INTENSITIES ON PAIN AND ENJOYMENT IN PEOPLE WITH EARLY RHEUMATOID ARTHRITIS

C. Balchin[1], A. L. Tan[2,3], L. A. Bissell[2,3], C. Reilly[1], J. Mckenna[1], O. Wilson[1], A. Stavropoulos-Kalinoglou[1]. [1]*Leeds Beckett University, Leeds, United Kingdom*; [2]*Leeds Institute of Rheumatic and Musculoskeletal Medicine, University of Leeds, Leeds, United Kingdom*; [3]*NIHR Leeds Biomedical Research Centre, Leeds Teaching Hospitals NHS Trust, Leeds, United Kingdom*

Background: The benefits of exercise for people with rheumatoid arthritis (RA) are now widely recognised [1]. However, exercise participation among people with RA remains low. A key reason for that could be the commonly held belief that exercise, may exacerbate disease activity while acutely increasing levels of joint pain. The association of acute exercise with pain has not been established in RA and especially in people with a recent diagnosis.
Objectives: This study investigated the impact of acute aerobic-and resistance-type exercise on perceptions of pain in people with early RA.
Methods: Following local NHS ethical approval, ten people with RA volunteered for the study (Age=46±13years; BMI=29.4±8.6kg/m^2, RA diagnosis= 13±9months, mean±SD). Inclusion criteria were RA diagnosis (2010 EULAR criteria) within the last two years and not engaging in regular physical activity (i.e. no participation in structured exercise >2 times per week). They were assessed for maximal aerobic capacity and maximal strength at chest press, leg press and wide-grip lateral pulldown to determine intensities for exercise conditions. Thereafter they completed one no-exercise control trial (CON) and four exercise trials: 30 minutes of sub-maximal cycling at a workload equivalent to 65% VO_2max (CYCLE); high intensity interval exercise consisting of 10x1 minutes cycling intervals at a workload equivalent to 95% VO_2max (HIIE); resistance exercise consisting of three sets of 12-15 repetitions at 70%1RM (RES-70); resistance exercise consisting of three sets of repetitions to failure at 30%1RM (RES-30). All trials were randomised and separated by a washout period of 3-7 days. Participants completed a a visual analogue scale (VAS) for pain at baseline then 2-and 24-hours post exercise; they also completed a questionnaire related to exercise enjoyment 2-and 24-hours post exercise.
Results: Currently four RA participants have completed the study and all participants completed the prescribed exercises in full. Perceived pain was low at 2 hours (0.7±0.4) and 24 hours post-exercise (1.2±0.8) for all exercise conditions (see table 1). Importantly, a difference in heart rate between the aerobic conditions (heart rate during HIIE was 16% higher than during CYCLE), and a difference in workload between the resistance conditions (RES-30 was 117% higher than RES-70) did not result in a difference in pain perception. One participant reported increased pain at 24 hours (7cm vs 1cm at 2 hours) post RES-30, but claimed that this was purely muscular and not joint pain. Interestingly, all participants enjoyed the exercises with comparable high results across the exercise conditions (see table 1).

Table 1 Pain and Enjoyment Descriptives

Trial	Baseline VAS pain (cm)	2-hour VAS pain (cm)	24-hour VAS pain (cm)	2-hour exercise enjoyment (1-119)	24-hour exercise enjoyment (1-119)
CON	0.1±0.3	0.1±0.3	0.3±0.3	63.8±13.0	63.8±13.0
CYCLE	0.1±0.3	0.5±0.4	0.9±1.2	86.8±11.0	88.0±8.8
HIIE	0.1±0.3	1.3±1.9	1.1±1.7	85.0±27.8	88.3±19.1
RES-70	0.1±0.3	0.4±0.4	0.5±0.4	91.3±13.0	88.3±6.6
RES-30	0.1±0.3	0.4±0.5	2.4±3.1	88.5±17.1	85.0±13.1

(mean±SD)

Conclusion: This study identified minimal exercise effect on perceived pain at 2 hours-and 24 hours-post exercise among participants with early RA. This suggests that exercise did not exacerbate pain and importantly, high intensities and high loads did not cause additional pain. Nevertheless, further larger studies are required to examine the role of acute exercise on disease activity, e.g. inflammation, and the association with perceived pain in people with early RA.

AB1260 ARE THERMAL CURE AND REHABILITATION EFFECTIVE FOR RELIEVING LOW BACK PAIN? RESULTS OF A RANDOMIZED CONTROLLED TRIAL

A. Fazaa[1], N. Belguith[2], A. Abdennebi[3], J. Mbarek[4], S. Miladi[1], M. Sellami[1], K. Ouenniche[1], S. Kassab[1], S. Chekili[1], L. Souabni[1], A. Ben Hamida[5], L. Zakraoui[1], K. Ben Abdelghani[1], A. Laatar[1]. [1]*Hôpital Mongi Slim, Rhumatology, La Marsa, Tunisia*; [2]*institut kassab d'orthopédie, médecine physique rééducation et réadaptation fonctionnelle, Mannouba, Tunisia*; [3]*station thermale Djbal ElOuest, Zaghouan, Tunisia*; [4]*centre de rééducation Jbal El Ouest, Zaghouan, Tunisia*; [5]*faculté de medecine de Tunis, épidemilogie, Tunis, Tunisia*

Background: Low back pain (LBP) is a major health problem around the world. It affects almost 80% of the population. Patient with LBP suffer from a heavy pain which is associated to long time incapacity. Different methods of treatment are applied in the objective of reducing pain and thus improving functional capacities of patients.
Objectives: Our study aimed to compare the benefits, with regard to LBP symptoms, of a thermal cure and a rehabilitation treatment.
Methods: It is a randomized therapeutic trial including patients with LBP, randomly divided into two groups: thermal cure and physical rehabilitation. Both of them were conducted in the same spa center of Djbal El Ouest. Outcome measures were visual analogic scale of pain (VAS), Oswestry Disability Index (ODI), Short Form-36 (SF36) questionnaire and schober test. Evaluation was carried out at day 18, 3 months, 6 months and 12 months following treatment.
Results: Seventy-four patients were included, divided into 2 groups: thermal group (n=37) and dry rehabilitation group (n=37). Seventy patients performed the full treatment.
In the group of patients treated with thermal cure treatment (n=37), a significant improvement of VAS of pain, ODI and SF 36 was noted in day 18, 3 months,6 months and 12 months (Table 1).

Table 1. Tendencies of the clinical indexes after treatment by thermal cure

	D0 (n=37)	D18 (n=37)	3months (n=35)	6months (n=32)	12months (n=36)
VAS ± SD	68,2 ± 16,2	**35,8 ± 26,5**	**55 ± 19**	**60,2 ± 18,1**	**56,1 ± 19**
P		**0,000**	**0,000**	**0,008**	**0,002**
ODI ± SD	38,3 ± 14,1	**29 ± 17,5**	**32 ± 14,1**	30,2 ± 14,1	**28,5 ± 13,6**
P		**0,03**	**0,03**	0,07	**0,000**
SF 36 physical mean score ± SD	34,4 ± 14,3	**64,2 ± 18**	**45,9 ± 19**	**50 ± 21,8**	**47,9 ± 18,5**
P		**0,000**	**0,000**	**0,000**	**0,001**
SF36 mental mean score ± SD	38,9 ± 16,3	**71 ± 21,6**	**55,1 ± 20,4**	**56,4 ± 19,9**	**52,2 ± 20,8**
P		**0,000**	**0,000**	**0,000**	**0,000**
Scober test ± SD	3,1 ± 1,3	**3,5 ± 1,3**	2,8 ± 1	3 ± 1,1	3,2 ± 1,5
P		**0,037**	0,322	0,812	0,657

VAS: visual analog scale; ODI: Oswestry Disability Index; SF36: short form 36

In the group of patients treated with physical rehabilitation (n=33), a significant improvement of the VAS of pain and of the physical mean score of SF36 was noted only on day 18 (Table 2). A significant improvement of the mental mean score of SF 36 was noted on day 18 and 6 months (Table 2).

Table 2. Tendencies of the clinical indexes after treatment by physical rehabilitation

	D0 (n=37)	D18 (n=33)	3 months (n=28)	6 months (n=29)	12 months (n=25)
VAS ± SD	64 ± 19,5	**47,4 ± 24,6**	55,7 ± 18,1	50,5 ± 27,5	62,2 ± 22,2
P		**0,002**	0,091	0,057	0,567
ODI ± SD	34,3 ± 12,3	31,1 ± 17,3	31,9 ± 15,6	30,3 ± 18,8	31,1 ± 12
P		0,268	0,258	0,296	0,150
SF 36 physical mean score ± SD	38,1 ± 16,1	**53,8 ± 22**	42,6 ± 16,4	45,1 ± 18,7	42,6 ± 16,2
P		**0,002**	0,284	0,202	0,185
SF36 mental mean score ± SD	39,3 ± 17,5	**61,6 ± 23,5**	45,1 ± 18,9	**49,6 ± 24,6**	46,9 ± 22,1
P		**0,000**	0,130	**0,033**	0,09
Schober test ± SD	3,2 ± 1,4	**3,5 ± 1,3**	3,4 ± 1,4	2,7 ± 1,2	2,9 ± 1,3
P		0,845	0,983	0,091	0,346

VAS: visual analog scale; ODI: Oswestry Disability Index; SF36: short form 36

Comparison of the two types of tested treatments showed a certain number of statistically significant differences. The VAS and physical mean score of SF 36 at day 18 and mental mean score of SF-36 at 3 months were significantly lower on the thermal cure group, while schober test at 3 months was significantly lower in the physical rehabilitation group.

Conclusion: Our study suggests a superiority of thermal cure in relieving pain and improving quality of life at short term among patient with LBP and a comparable efficacy in improving lumbar spine function. However, the effectiveness of physical rehabilitation was greater on spine mobility.

AB1261 DOUBLE-BLIND PLACEBO-CONTROLLED TRIAL OF PULSED ELECTROMAGNETIC FIELD THERAPY IN KNEE OSTEOARTHRITIS (PRELIMINARY RESULTS)

D. Karateev[1], A. Makevnina[1], A. Tangieva[1], E. Luchikhina[1], H. Hamhoeva[1].
[1]Moscow Regional Research and Clinical Institute ("MONIKI"), Rheumatology Department, Moscow, Russian Federation

Background: Pulsed electromagnetic field (PEMF) therapy is widely used in different areas of medicine. There are a lot of portable PEMF therapeutic devices on the market around the world. Nevertheless, the role of PEMF in treatment of rheumatic conditions is not clear. Current evidence is of low and very low quality.

Objectives: To study efficacy and safety of PEMF therapy in primary and secondary osteoarthritis (OA) of the knee in controlled clinical trial.

Methods: This abstract presents the preliminary results of an ongoing double-blind placebo-controlled trial of PEMF portable therapeutic device "ALMAG+" (Certificate EN ISO 13485:2012+AC:2012 reg.-No 44221 117836, Yelatma Instrument-Making Enterprise, Russian Federation, Reg. Num.: 3007075140). The device is intended for physiotherapeutic treatment and rehabilitation with a low-frequency low-intensity PEMF in medical institutions, as well as at home after the recommendation of a doctor. Patients with primary and secondary (as a part of inflammatory rheumatic disease) OA of knee with Kellgren-Lawrence Grade I-III included in the study (in patients with inflammatory conditions disease activity should be minimal on stable drug therapy). Three courses of PEMF of 20 procedures for 1 year planned in active treatment group and placebo (inactive device) group of 35 patients each. Efficacy is evaluated by pain VAS, WOMAC, Lequesne index, and quality of life studied using SF-36, EuroQoL 5D tools. Instrumental control with knee ultrasound and MRI investigations will be performed. The study protocol was approved by local Ethical Committee.

Results: To date 23 patients (7 males, 16 females, age 54,6±11,2 years, primary knee OA – 16 pts, RA- 6 pts, AS – 1 pt) completed 1st course of PEMF. Table presents differences (Δ) in the main clinical parameters in active treatment and placebo device groups. No significant difference in ESR or CRP levels was found. No treatment-related adverse events has been reported.

Table. Differences (Δ) in the main clinical parameters after a 1st course of PEMF.

Parameter	Active device (n=11)	Placebo device (n=12)	p
Δ VAS pain in movement	15 [0; 38,5]	5 [1,25; 10,5]	0,053
Δ VAS pain in rest	10 [0; 34]	1 [0; 2,75]	0,043
Δ WOMAC	3 [2; 10]	2 [0; 4,5]	0,174
Δ Lequesne index	3 [0; 4]	1 [0,25; 2,5]	0,258

Conclusion: In this preliminary analysis pulsed electromagnetic field (PEMF) therapy showed significant impact on pain in rest in knee OA after one course of procedures.

AB1262 EFFECTS OF TAI CHI EXERCISE ON PAIN, FUNCTIONAL STATUS AND QUALITY OF LIFE IN PEOPLE WITH OSTEOARTHRITIS AND INFLAMMATORY ARTHRITIS

N. Kalebota[1], M. Milošević[2], N. Laktašić Žerjavić[1], A. Andreić[3], B. Končar[4], M. Vedriš[4], P. Turković[4], N. Žura[1], K. Kovač Durmiš[1], I. Žagar[1], P. Perić[1].
[1]Clinical Hospital Centre Zagreb, University Department for Rheumatology and Rehabilitation, Zagreb, Croatia; *[2]University of Zagreb, School of Medicine, Andrija Štampar School of Public Health, Zagreb, Croatia*; *[3]Patient Advocacy Association, Zagreb, Croatia*; *[4]Croatian Wushu Federation, Zagreb, Croatia*

Background: Tai Chi as a type of physical activity (PA) is included in recommendations for PA in people with inflammatory arthritis (IA) and osteoarthritis (OA).[1]

Objectives: The aim of this study was to evaluate the effect of Tai Chi exercise program on pain, functional status and quality of life in people with OA and IA.

Methods: A study co-funded by the Erasmus + European Union Program for Sporting Activities called #WushuElixir was conducted in Croatia, Slovenia, Belgium and Spain. We present the results of the research conducted in Croatia from October 2018 to April 2019. A total of 44 participants (Pts) entered the Tai Chi exercise program. Majority of Pts were female with OA (Table 1). Tai Chi exercise program was performed for 60 minutes, twice a week, with a total of 50 training sessions. In data analysis where included only those Pts who completed at least 36% of exercise program, a total of 28 (63.6%) Pts, out of which 24 (85.7%) completed at least 70% of exercise program. An average attendance was 39 (78%) sessions. Outcome measures were: pain (VAS scale), stability and balance (Functional reach test; FRT), chest mobility (breathing index), spinal mobility (cervical and thoracic sagittal indices and Schober's test), muscle strength (Wall sit test), physical function (Lequesne Index of severity for OA of the hip, and Stanford Health Assessment Questionnaire (HAQ) 20-Item for IA) and quality of life (15D© The health-related quality of life instrument; 15D QL). For statistical analysis t-test for paired samples was used with statistical significance set on P<0.05.

Table 1. Descriptive statistics of participants

		N	%
Gender	Male	4	14.3%
	Female	24	85.7%
Age groups	≤45 years	3	10.7%
	46-60 years	9	32.1%
	61-70 years	11	39.3%
	≥71 years	5	17.9%
Diagnosis	Osteoarthritis of the spine, hip and knee	19	67.9%
	Inflammatory arthritis	5	17.9%
	Other	4	14.3%

Results: There was significant improvement in breathing index (P<0.001), sagittal mobility of cervical (P<0,001) and thoracic spine (P=0.007), Schober's

test (P<0,001), Wall sit test (P=0.042), 15D QL (P=0.048) and Lequesne index (P=0.030). There were no significant changes in VAS pain level (P=0.651), FRT value (P=0.442) and Stanford HAQ-20 scale result (P=0.186).

Conclusion: Tai Chi can improve functional status and quality of life in people with OA and IA.

AB1263 THE EFFICACY OF PULMONARY REHABILITATION IN PATIENTS WITH ANKYLOSING SPONDYLITIS

N. Sahin[1], N. Sarıoğlu[2], B. Görcan[1]. [1]*Balikesir University, Physical Medicine and Rehabilitation, Balikesir, Turkey*; [2]*Balikesir University, Chest Diseases, Balikesir, Turkey*

Background: Ankylosing spondylitis (AS) is a rheumatic disease that can cause a restrictive lung condition. Pulmonary rehabilitation increases lung capacity in patients with lung disease. In this study, we aimed to show increase in exercise capacity, decrease in dyspnea and change in quality of life with pulmonary rehabilitation in patients with AS.

Objectives: In this study, we included 20 AS patients of whom admitted to our outpatient clinic. At the beginning and end of the study, patients some findings such as SFT, FEV1 values, saturations, arterial blood pressures and heart rates were recorded separately. Also, BODE index results, 6-minute walk test (MWT) values, BORG dyspnea scores, Modified Medical Research Council (MMRC) dyspnea scales, Anxiety Stress Scales (ASS) were examined. Short Form-36 (SF-36) questionnaires were filled out.

Methods: Patients underwent rehabilitation for 8 weeks, two days in a week at hospital and one day at home. According to their exercise tolerances in rehabilitation, patients were given upper and lower limb endurance training, strength training, flexibility and stretching exercises, balance exercises, inspiratory muscles training.

Results: In our study, patients with AS showed significant improvement in MMRC, borg dyspnea scales and 6 MWT at the end of rehabilitation compared to beginning of rehabilitation (p<0.05). It is shown that there was significant improvement in the values of PEF % and FVC%, when the difference averages before and after rehabilitation were compared (p < 0.05) but there was no difference in FEV1 %, FEV1/FVC values (p > 0.05). There was also significant improvement in BASDAI-BASFI values (P=0.006, P=0.016, respectively). The bode index showed no significant difference (p > 0.05). There was significant improvement in anxiety on ASS. Only the mental parameter showed significant improvement when parameters evaluated by the SF-36 survey (p < 0.05). There was no significant difference in the rest of all parameters (p>0.05).

		Before treatment n=20 (Mean ±SD)	After treatment n=20(Mean ±SD)	p*
FVC		84,35±13,92	86,40±13,42	,007
FEV1		84,50±13,03	85,30±11,13	,431
FEV1_FVC		105,30±9,57	85,30±11,13	,837
PEF		64,80±17,14	67,60±16,65	,003
6-Minute Walk Test		415,5500±124,88625	439,900±122,364	,000

AB1264 THE EFFECTIVENESS OF KINESIOTHERAPY FOR PAIN SHOULDER SYNDROME

O. Tikhoplav[1], E. Guryanova[1,2], O. Moskovskaya[1], A. Moskovskij[1]. [1]*Chuvash State University, Cheboksary, Russian Federation*; [2]*Institute for Advanced Medical Studies, Cheboksary, Russian Federation*

Background: Pain shoulder syndrome is one of the most common conditions that is inherent in patients with various diseases and conditions. This problem is faced by both patients of a rheumatological profile (rheumatoid arthritis), and patients of other profiles: neurological (stroke, hernia of the cervical spine), traumatological (periarthritis). The regular use of painkillers and NSAID is associated with a risk of serious adverse reactions in patients.

PNF therapy can have a fairly quick positive effect. Kinesiotaiping is a common and easily accessible treatment method that, due to the inclusion of local neuromuscular adaptation mechanisms, can have an analgesic effect.

Objectives: The purpose of the study is to compare the effectiveness of traditional treatment methods in combination.

Methods: Patients with pain shoulder syndrome who were admitted to the doctor of physical and rehabilitation medicine were randomly assigned to one of three groups: group G1 - 20 patients who received combined treatment, including massage, acupuncture, PNF, kinesiotherapy.

Patients of group G2 (20 people) who received massage and acupuncture sessions, kinesiotherapy, but did not deal with PNF.

Patients in group G3 (20 people) received massage, acupuncture, and PNF, excluding kinesiotaping.

All patients received treatment 5 times a week (Monday to Friday, excluding Saturday and Sunday), the total duration of the rehabilitation course is 20 days. The program included: 30 minutes an acupuncture session, 20 minutes massage, 45 minutes physical exercises with a physical therapist. Classes using the PNF technique were carried out separately every other day for 45 minutes using the standard method for shoulder pain.

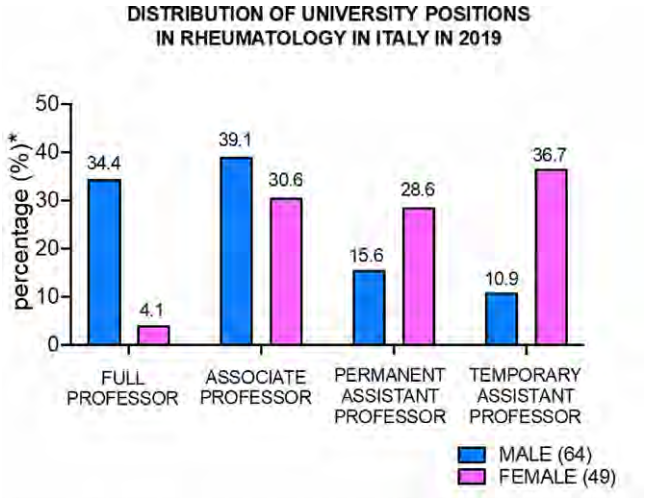
VAS was used to monitor efficacy. Pain was assessed at the beginning of the study, with the third, sixth, ninth and last visit to the clinic.

Results: The age composition of the patient group is from 31 to 70 years. The gender composition is 35 (58.33%) women, and 25 (41.67%) men.

The average time between the onset of clinical symptoms and the first treatment session was 47.3 days. In 90% of patients, a history of pain lasted from 6 weeks or more. 52 patients (86.67%) completed the treatment completely. Of these, G1 is 19 people (90% of this group), 16 (80%) in G2, and 17 of 20 in the G3 group (85%).

The average VAS score in G1 was 5.15 at the start of the study, and after the tenth session, it dropped to 2.78. A significant decrease in pain is also observed in the G2 group (from 5.17 at the beginning of the study to 3.19 after the tenth session). The G3 group in terms of pain reduction almost equaled the G1 group, where the level of pain from 5.16 decreased to 2.71.

Patients within 6 months after treatment evaluated the level of pain on their own and reported the data to the doctor. In patients of group G1, after 6 months, the average VAS score is 3.71. G3 patients after 6 months, the VAS score is 4.25 points. Patients of the G2 group at 3 months noted a return of the pain syndrome, after 3 months, the VAS score was 5.11.



Conclusion: The obtained results testify to the high efficiency of PNF therapy, however, the combination with kinesiotyping allows better consolidation of the effect of therapy and prolongs remission of pain syndrome.

Education

AB1265 GENDER DISTRIBUTION AND GENDER-RELATED ISSUES AMONG YOUNG RHEUMATOLOGISTS AND ACADEMIC POSITIONS IN RHEUMATOLOGY: A SNAPSHOT OF THE CURRENT SITUATION IN ITALY

L. Andreoli[1], S. Alivernini[2], A. Alunno[3], S. L. Bosello[2], C. Chighizola[4], P. Conigliaro[5], E. Gremese[2], C. Iannuccelli[6], L. Quartuccio[7], F. R. Spinelli[6], M. Vadacca[8], M. S. Chimenti[5]on behalf of SIRyoung and ReDO - Italian Society for Rheumatology. [1]*University of Brescia, Brescia, Italy*; [2]*Fondazione Policlinico Universitario A. Gemelli IRCCS – Università Cattolica del Sacro Cuore, Rome, Italy*; [3]*University of Perugia, Brescia, Italy*; [4]*Istituto Auxologico Italiano, Milan, Italy*; [5]*Tor Vergata University, Rome, Italy*; [6]*Sapienza University, Rome, Italy*; [7]*University of Udine, Udine, Italy*; [8]*Campus Bio Medico University, Rome, Italy*

Background: The Italian Society for Rheumatology (SIR) comprises committees for Rheumatologists under the age of 40 (SIRyoung) and for Women in Rheumatology (Reumatologhe Donne – ReDO). As female representation is increasing in rheumatology worldwide [1], there has been interest in assessing gender-related issues.
Objectives: To describe the gender distribution among young members of SIR and academic positions in Rheumatology in Italy. To assess the expectations and needs of young rheumatologists with regard to their career.
Methods: SIRyoung members developed a web-based survey which was distributed among SIR members under the age of 40 during the spring of 2019. Responses were collected and analysed anonymously. ReDO retrieved and analysed the data regarding academic positions in Italy in September 2019 from official data by "Ministry of Education, University and Research" (www.miur.it).
Results: Out of 478 SIR members under 40 (66.5% F), 113 (23.7%) completed the SIRyoung survey (62.1% F). Regarding career plans, male and female members responded: hospital physician (36.9% vs 37.8%), outpatient clinic physician (18.5% vs 28.3%), academic career (23.9% vs 22.8%), private practice (16.3% vs 9.4%), and industry (4.3 vs 1.6%), respectively. When asked about their interest in doing a fellowship in another national center or abroad, 60.8% of male and 72.8% of female respondents were interested but thought they could not afford it. Reasons reported by males and females were: working reasons, namely barriers to temporarily leave the workplace (61.3% vs 50.7%), family reasons (16.1% vs 25.4%), financial reasons (22.6% vs 16.5%), respectively. As for academic rheumatology in Italy, 113 positions were retrieved. Men held 64 positions (57%) and women 49 (43%). Full professors were mostly men (92%), while assistant professors were women in 65% of the cases (58% of those with a permanent position; 72% of those with a temporary position) (Figure) [2].
Conclusion: Our study explored for the first time gender distribution and related issues in Rheumatology in Italy. Female representation accounts for two thirds of SIR members under 40. This could reflect the general trend of medical school being chosen more often by women than men. No differences were observed in the career expectations of male and female rheumatologists. Interestingly, nearly one fourth of female respondents were interested in academic career, confirming the trend toward female predominance observed for assistant professors. Therefore, it is likely that the next generation of full professors will have a balanced gender distribution, as it is already for associate professors. The choice of a fellowship is still hampered by several problems, but it seems that reasons for not pursuing such opportunities are similarly distributed in males and females. Although family reasons tend to be more frequent in female rheumatologists, this is not significant as compared to men. This could indicate that family affects career choices of both male and female rheumatologists. It is important that national societies promote surveys for the assessment of gender specific issues among their members, in order to identify unmet needs and design interventions for career support regardless of gender.

*percentages referred to the individual male (n=64) and female (n=49) cohorts, respectively

AB1266 JOINTS STILL PLEADING FOR ATTENTION

P. Arora[1], L. H. Lee[1]. [1]*University Hospitals of Derby and Burton NHS Foundation Trust, Derby, United Kingdom*

Background: Despite the prevalence of musculoskeletal diseases in an increasingly elderly patient population, musculoskeletal (MSK) examination remains frequently overlooked and poorly completed in medical clerking. Indeed, studies over the years have emphatically demonstrated the widespread omission of MSK examination. (1,2)
Objectives: The aim of this study was to evaluate the documentation of MSK examination in medical clerking on the acute medical take. Furthermore, we sought to assess doctors' perception of MSK examination and to evaluate the effect of GALS teaching.
Methods: Medical clerkings of 50 patients in the medical assessment unit (MAU) were reviewed on a single day irrespective of the pathology. Case notes were assessed for presenting complaints and documentation of clinical examination findings. Results of the baseline study along with GALS examination techniques were presented at the departmental meeting. Case notes review was subsequently repeated with the same sample size.
Results: Baseline study showed that MSK exam was recorded in only 10% of patients despite 20% of patients presenting with fall/collapse. In contrast, 100% of medical clerkings had respiratory examination, 94% had cardiovascular examination while 94% had abdominal examination documented. Although confidence in performing MSK examination was not felt to be a problem, perceived time constraints was a major barrier.
Repeat study with another 50 set of clerkings demonstrated a significant improvement, with 22% of clerkings having MSK examination recorded. However, the quality of documentation of MSK examination remained sketchy.
Conclusion: Our study reaffirms the fact that MSK examination remains broadly neglected despite the high proportion of patients admitted with fall or collapse. Although the completion of MSK examination improved following GALS screen teaching, the quality of clinical examination documentation remained inadequate. Evidently, the indifference towards MSK examination warrants prompt attention and action by medical educators and rheumatologists.

AB1267 ONLINE CASE-BASED EDUCATION SIGNIFICANTLY IMPROVED RHEUMATOLOGISTS' KNOWLEDGE AND CONFIDENCE IN MANAGING PATIENTS WITH RA

E. Bell[1], A. Sendaydiego[2], P. C. Taylor[3]. [1]*Medscape LLC, New York, United States of America*; [2]*Medscape LLC, New York, United States of America*; [3]*Norman Collisson Professor of Musculoskeletal Sciences, University of Oxford, Oxford, United Kingdom*

Background: With the rapid evolution in treatment strategies and the increasing range of available therapeutics for rheumatoid arthritis (RA), keeping pace with advances can be a challenge for busy physicians.
Objectives: We assessed whether online CME can improve rheumatologists' knowledge of RA management focusing on the assessment and monitoring of RA, the selection of appropriate treatments and the clinical efficacy and safety data for JAK inhibitors.
Methods: Rheumatologists participated in a text-based activity featuring two patient cases with questions that "tested" knowledge and discussion of the main "teaching" points. Educational effect was assessed using a repeated-pair design, pre-/post-assessment. A Chi-square test of independence determined if a statistically significant improvement (5% significance level, $P<.05$) existed in the number of correct responses between the pretest and posttest scores. Cramer's V estimated the effect size of the education. The activity launched on 15 December 2018 with data collection through 27 February 2019.
Results: •Significant improvement in average percentage of correct responses, rising from 47% at baseline to 92% post-activity ($P<.001$) and extensive educational impact (Cramer's V=0.496)
•Significant increase in percentage of rheumatologists (n=111) answering all 3 questions correctly (9% at baseline rising to 78% post assessment)
•Significant improvements in knowledge of EULAR/ACR assessment criteria (86% improvement, $P<.001$), EULAR treatment recommendations for a patient failing on MTX and a TNF inhibitor (100% improvement, $P<.001$), and the VTE risk associated with having RA or receiving RA treatments (108% improvement, $P<.001$)
•46% of rheumatologists reported greater confidence in their ability to appropriately incorporate JAK inhibitors into the treatment of patients with RA (average confidence shift 20%)
Conclusion: Overall, this learning activity was highly successful in improving rheumatologists'
knowledge and confidence in managing patients with RA, particularly with regard to the appropriate use of JAK inhibitors in patients for whom such treatment is suitable. The extensive impact of this interactive 'test then teach' activity is likely to directly translate into patient benefit. Further education on this topic would be useful to enhance and reinforce this knowledge and to support physician confidence in the use of JAK inhibitors in clinical practice.

AB1268 ONLINE EDUCATION YIELDS SIGNIFICANT GAINS IN RHEUMATOLOGISTS' KNOWLEDGE OF THE ROLE OF JAK INHIBITORS IN THE MANAGEMENT OF RA

E. Bell[1], M. Calle[1], R. Van Vollenhoven[2]. [1]*Medscape LLC, New York, United States of America*; [2]*Amsterdam Rheumatology and Immunology Center ARC, Amsterdam, Netherlands*

Background: The treatment armamentarium for rheumatoid arthritis (RA) has expanded rapidly in recent years, making it challenging for rheumatologists to stay up to date with key advances. The most recently available treatment options for RA are the JAK inhibitors.
Objectives: Our goal with this activity was to assess whether online CME can improve rheumatologists' knowledge of the role of JAK inhibitors in the management of RA.
Methods: Rheumatologists participated in an online CME activity entitled 'Advancing patient care in rheumatoid arthritis: role of JAK inhibitors'. This was a 30-minute video roundtable discussion between 3 experts, with accompanying slides. This CME activity launched on April 30 2019 with data collection through September 13 2019. The educational effect was assessed using a repeated-pair design, pre-/post-assessment. A Chi-square test of independence determined if a statistically significant improvement (5% significance level, $P<.05$) existed in the number of correct responses between the pretest and posttest scores. Cramer's V estimated the effect size of the education.
Results: •Significant improvement in average percentage of correct responses, rising from a relatively high baseline of 67% to 81% post-activity ($P = .0006$)
•Increase in percentage of rheumatologists (n=68) answering all 3 questions correctly (37% at baseline rising to 66% post assessment)
•Significant improvement in knowledge of clinical trial safety data for JAK inhibitors (43% improvement, $P = .0079$)
•Numerical improvement from relatively high baseline for understanding of unmet needs in RA patients (74% at baseline, 87% post-activity) and the advantages of JAK inhibitors versus TNF inhibitors for a specific patient case (75% at baseline, 84% post-activity)
•Considerable educational impact (Cramer's V = 0.167) with 35% of rheumatologists reporting greater confidence in describing the mechanism of action of current and emerging JAK inhibitors (noteable average confidence shift of 15%)
Conclusion: A positive and significant effect on physician knowledge and confidence regarding JAK inhibitors for RA was achieved following this online CME activity. The extent of this educational impact is likely to lead to better patient outcomes since physicians are better equipped to consider JAK inhibitors for appropriate patients. The results also revealed that physicians would benefit from additional education to reinforce their knowledge of key clinical data for JAK inhibitors and on the use of JAK inhibitors in clinical practice.

AB1269 REGIONAL DIFFERENCES IN THE PATIENTS' UNDERSTANDING OF TREATMENT STRATEGY IN RHEUMATOID ARTHRITIS

C. Cobilinschi[1], M. Danila[2], D. Opris-Belinski[1], I. Saulescu[1], L. Groseanu[1], S. Daia-Iliescu[1], C. Codreanu[1], R. Ionescu[1], M. Parvu[3], H. Popoviciu[4], C. Ancuta[5], E. Rezus[5], C. Mihailov[6], R. Ionescu[1]. [1]*Carol Davila University of Medicine and Pharmacy, Bucharest, Romania*; [2]*University of Alabama at Birmingham, Birmingham, United States of America*; [3]*Colentina Clinical Hospital, Bucharest, Romania*; [4]*George Emil Palade University of Medicine, Pharmacy, Science and Technology, Targu Mures, Romania*; [5]*Grigore T. Popa University of Medicine and Pharmacy, Iasi, Romania*; [6]*Ovidius University, Constanta, Romania*

Background: The treat-to target (T2T) concept is the standard for treating rheumatoid arthritis (RA) patients worldwide[1]. However, difficulties that patients encounter in achieving disease control may differ between regions, which may impact the type of support needed for successful T2T implementation.
Objectives: To compare differences in patient-reported challenges to controlling RA-related issues between Romanian and US patients.
Methods: A cross-sectional study that recruited 403 RA patients was conducted in six centers in Romania. Patients were invited to complete an RA-related questionnaire. We compared their responses to those from a previous published study that included patients with RA from the US[2]. The survey included items on subjective beliefs about RA treatment (e.g. adherence, cost, adverse events) and knowledge about T2T strategy. Approval for US data use was given by the study coordinator[2].
Results: All patients in the Romanian cohort were Caucasian, with a mean age of 58.7 years (SD 11.6). 78% were females and the mean disease duration was 11.2 years (SD 8.3). Data was concordant with results from the previously published study. More patients from US had college education (60% vs 43.9%).
Among the respondents, 93.3% Romanians were on a synthetic DMARD versus 97.7% Americans and 64.01% were currently on a biologic of choice compared to 74% patients in the US. More than half of the patients in both regions had a history of biologic DMARD use.
Asked to grade (0 *very good*, 10 *very bad*) their disease activity on the survey day, a large category of patients (37.4%, SD 14.1) marked an average state (4-6), while 19.08% (SD 11.2) were feeling poorly related to their disease.
Patients were asked to define their adherence to RA treatment in the last 30 days. While the US study reported that 93% of patients were adherent[2], in our study only 62.5% of the Romanian patients reported adherence ($p<0.01$). A significantly lower proportion of Romanian patients were aware of T2T strategy (35 %, p 0.04).
Regarding patient beliefs on their disease, statements were grouped into categories such as difficulty managing pain, medication safety, adherence, lifestyle.

Most European patients would agree to change treatment to lower pain. Almost 82% stated they would accept rare adverse events in order to avoid invalidity, to confirm a better future outcome. US patients were more prone to stick to current therapy than escalade to increase clinical response. However, asked about novel therapies, Romanians were reluctant to changing treatment despite insufficient benefit, if the risk of cancer was noted. There was a high agreement that a delay in treatment would be unsatisfactory for both familial and professional chores.

Conclusion: There are regional differences in knowledge and perceptions about RA treatment. Romanian patients know less on T2T algorithm. Improving awareness of the T2T strategy among RA patients may need different types of support depending on the patient's place of residence.

AB1270 RHEUMATOLOGY WORKFORCE IN LATIN AMERICA: TRAINING AND CURRENT STATUS

D. G. Fernández-Ávila[1], D. Patino-Hernandez[1], S. Kowalski[1], A. Vargas-Caselles[1], A. M. Sapag Durán[1], A. Cachafeiro Vilar[1], B. Meléndez[1], C. S. Pastelín[1], C. Graf[1], C. Rossetto[1], D. Palleiro[1], D. Trincado[1], D. Fernández-Ávila[1], D. Arrieta[1], G. Reyes[1], J. Then[1], M. F. Ugarte-Gil[1], M. Cardiel[1], N. Colman[1], N. Chávez[1], P. Burgos[1], R. Montufar[1], S. Sandino[1], Y. Fuentes-Silva[1], E. Soriano[1]. [1]*PANLAR, Miami(Headquarters), United States of America*

Background: The demand for rheumatology care has been steadily increasing over the last few years. However, supply seems to be insufficient, according to previous research[1]. This situation may be at least partly explained by less physicians beginning a rheumatology residency program[2].

Objectives: We aim to identify baseline data, room for change, and to strengthen functional processes associated with the rheumatology workforce in order to improve care offered to patients living with rheumatic diseases.

Methods: Descriptive cross-sectional study. We obtained data on each country through local PANLAR rheumatologists. They completed an online survey using the RedCap® platform, used for capture and storage of data. The sample was described according to the type of variable.

Results: 19 Latin American countries were included in this study, globally 1 rheumatologist was available per 106,838 inhabitants. The highest rates were found in Uruguay (1 per 23.695 inhabitants) and Argentina (1 per 40.384 inhabitants). The lowest rates were found in Nicaragua (1 per 640.648 inhabitants) and Guatemala (1 per 559.902 inhabitants). The ratio between women and men rheumatologists was 0,99 women per each man. The lowest proportions were found in Peru (0,26:1), and the highest in the Dominican Republic (2.5:1). The average age for rheumatologists was 51,6 (SD12,75). Lowest average ages were found in Paraguay (43,1 SD10,77) and the highest age averages were found in Peru (56,23 SD12.93). The average monthly compensation was USD $2.382,6 (SD$1.462,5). Venezuela had the lowest salary ($197), the highest salary was found in Costa Rica ($4.500). The proportion of rheumatologists trained abroad was 26,7%, ranging between 0% in Uruguay and 90% in Bolivia.

The countries with more rheumatology training programs were Brazil n = 50 and Mexico n = 20, while Ecuador, Honduras and Nicaragua don't have any. The countries with the greatest amount of active residents were Brazil (n = 252) and Argentina (n = 100). The educational level required to enter the program was postgraduate studies in internal medicine in 42.11% of the programs. Currently, 108 residency programs in Latin America are active. Duration of residency programs is variable: 2 years (79.63% of cases), 3 years (16.67%), 4 years (1.85%), 5 years (0.96%) or 6 years (0.96%). The median monthly compensation for residents was $ 528 USD (IQR $ 774), the country with the highest payment was Costa Rica ($ 2637). Contrarily, in Cuba, Chile and Colombia there is no payment to residents. Finally, in 8 countries (42.11%) residents must not pay for their postgraduate studies, the average annual tuition expense in the rest of countries is $ 1248 (SD $ 2749).

Conclusion: The rate of rheumatologists per inhabitant is low. The demographic characteristics and the current status of the rheumatology workforce, as well as rheumatology training in Latin-America varies widely among countries. For instance, relevant differences can be found regarding payment to rheumatologists and residents, and tuition fees. The collected information will be useful when planning regional-based strategies, as well as for future research projects in each country and within PANLAR.

AB1271 PATIENT EDUCATION IN PSORIATIC ARTHRITIS: A SERVICE EVALUATION AT ONE YEAR

K. Austin[1], R. Prasad[1]. [1]*University Hospitals Bristol NHS Foundation Trust, Rheumatology, Bristol, United Kingdom*

Background: Recent studies have demonstrated an increasing burden of musculoskeletal (MSK) diseases worldwide.[1] The importance of patient education (PE) is often overlooked in the management of long term inflammatory conditions. The European League Against Rheumatism recommends that PE should be integral to standard of care in inflammatory arthritis.[2] PE increases patients' knowledge, skills and confidence in managing their condition and improves patient activation (PA). Evidence shows that improved PA results in better outcomes and improved experiences of care. We previously reported on improved knowledge and confidence amongst a small patient group with psoriatic arthritis (PsA) who had attended a pilot education session.[3] This education session was delivered to a wider group of patients with PsA over a 12 month period; we report on the evaluation received from this service.

Objectives: To provide a PE programme to a wider group of patients with PsA, using a multi-disciplinary team (MDT) approach and to evaluate whether this improved patients' knowledge, skills and confidence in managing their PsA.

Methods: Adult patients with PsA attending their rheumatology clinic appointments were invited to a 2.5 hour MDT education session which covered: 1) a general overview of PsA; 2) medications used in PsA; 3) the role of physiotherapy and occupational therapy; 4) flares and self- management. These were interactive sessions, held in a small group setting to allow for informal discussion and questions to the MDT. Written materials including several booklets and online resources were also provided. Patients evaluated their knowledge or understanding before and after each topic covered, on the same day, using an evaluation tool with1-10 Likert scale items. Changes in ratings were analysed using student's t-tests. Patients were also asked: which aspects they found particularly helpful; if there was anything they would like to have added/ have more of in the session; whether they found the session helpful; whether they would recommend

it to other patients; whether they would be interested in developing a PsA patient support group.

Results: Four sessions were held over a 12 month period. A total of 32 patients attended; 10 males and 22 females, across a range of age categories. Disease duration varied from less than1 year to over 10 years. There were statistically significant improvements in all topics covered: mean improvement of 91% in how well informed patients felt about PsA overall (p<0.0001); mean improvement of 74% in confidence in accessing help from the MDT (p<0.0001); mean improvement of 122% in how well informed patients were about medications used in PsA (p<0.0001); mean improvement of 99% in patients' confidence in self-managing a flare (p<0.0001). Aspects that patients found particularly helpful included "The whole session", "Asking questions to all different professionals", "Meeting other sufferers", "Management of flares", "Fatigue information" and "Online resources". Overall, 97% of patients (31 out of 32) found the session helpful and would recommend it to others. Over 40% of patients expressed interest in developing a local PsA support group.

Conclusion: Following a 2.5 hour education session, improved knowledge, skills and confidence in managing their PsA was reported by 97% of patients, including patients with disease duration of > 10 years. This supports our previous finding that an interactive, group PsA education programme is a feasible and important adjunct to patient care.

AB1272 ONLINE EDUCATION BOOSTS CLINICIAN KNOWLEDGE ABOUT EMERGING THERAPIES FOR PATIENTS WITH SYSTEMIC SCLEROSIS-ASSOCIATED INTERSTITIAL LUNG DISEASE

C. Rohani-Montez[1,2], M. Calle[1,2], C. Allen[1,2], A. M. Hoffmann-Vold[3], O. Distler[4]. *[1]Medscape Education Global, London, United Kingdom*; *[2]WebMD, New York, United States of America*; *[3]Oslo University Hospital, Oslo, Norway*; *[4]University Hospital of Zürich, Zürich, Switzerland*

Background: Systemic sclerosis-associated interstitial lung disease (SSc-ILD) has traditionally been treated with therapies such as cyclophosphamide, mycophenolate mofetil, and hematopoietic stem cell transplantation. However, these therapies are limited by potential toxicity, as well as duration and magnitude of effect. Clinicians need awareness of emerging therapies in late-stage clinical trials that may address these limitations.

Objectives: This study was conducted to determine whether online independent medical education could improve rheumatologists' and pulmonologists' knowledge of emerging therapies for the management of SSc-ILD.

Methods: Physicians (N = 2,076) participated in a 30-minute, 2-faculty, video-based, online CME with synchronized slides.[1] The majority of participants were rheumatologists (n = 522) or pulmonologists (n = 557), but the cohort also included clinical immunologists (n = 132) and other physicians with an interest in the topic (n = 865). This study focuses on the 120 rheumatologists and 111 pulmonologists who completed all pre- and post-questions. The effects of the education on knowledge was assessed using a 3-question, repeated pairs, pre-assessment/post-assessment study design. For all questions combined, the chi-square test assessed differences from pre- to post-assessment. P values <.05 are statistically significant. The activity launched on September 17, 2019, and data were collected through November 5, 2019.

Results: Overall significant improvements were seen after participation for both rheumatologists (average correct response rate of 55% at pre-assessment vs 75% at post-assessment; P<.001, N=120), and pulmonologists (average correct response rate of 60% at pre-assessment vs 77% at post-assessment; P<.001, N=111). Specifically, significant improvements were observed in clinicians' knowledge of clinical trial data for emerging SSc-ILD therapies (figure).

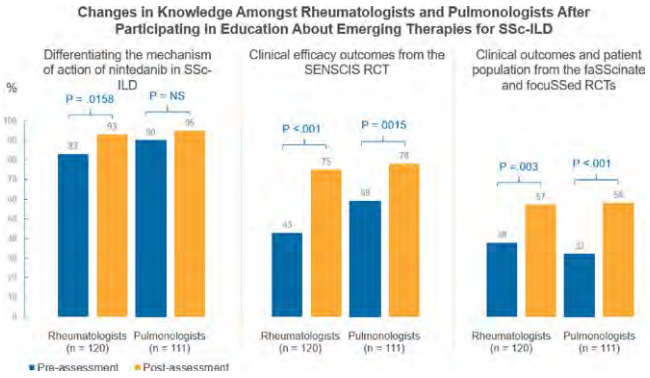

Figure.

Clinicians from APAC (n = 67) and Europe (n = 79) made up the majority of the cohort, and had similar rates of correct responses without significant differences, indicating consistent effects, independent of the region of origin. After participating in the activity, 48% of pulmonologists and rheumatologists had measurable improved confidence related to their knowledge of emerging therapies for patients with SSc-ILD.

Despite the increases in knowledge and confidence observed, the rates of correct responses suggest there is still room for improvement; therefore, ongoing education will be needed to reinforce knowledge of the latest data evaluating new therapies for SSc-ILD and what they will mean for future practice.

Conclusion: This study demonstrates the success of online, video-based education in improving rheumatologists' and pulmonologists' knowledge of the latest clinical data on emerging therapies for SSc-ILD. This could lead to earlier adoption of new, efficacious therapies that may slow disease progression and improve overall outcomes for these patients.

AB1273 TEACHING RARE DISEASES THROUGH ROLE PLAY: RESULTS OF AN EXPERIMENTAL WORKSHOP ON RAYNAUD PHENOMENON

S. Sanges[1,2,3,4], S. Morell-Dubois[2,4], M. M. Farhat[1,2,4], M. Assaraf[2], M. Lambert[1,2,4], V. Sobanski[1,2,4], D. Launay[1,2,4], E. Hachlla[1,2,4]. *[1]Université Lille, Faculté de Médecine, Lille, France*; *[2]CHU Lille, Service de Médecine Interne, Lille, France*; *[3]Centre de Simulation PRESAGE, Lille, France*; *[4]Centre National de Référence Maladies Systémiques et Auto-immunes Rares (Sclérodermie Systémique), Lille, France*

Background: Systemic autoimmune diseases are mostly taught through theoretical lectures, which do not allow for the acquisition of physical examination skills and semiologic confrontation.

Objectives: We report herein the results of a pilot experiment using role-play to teach how to manage patients with Raynaud phenomenon (RP).

Methods: We developed a workshop that consisted of two 30-minute OSCE (Objective and Structured Clinical Examination) stations. Students were divided into groups of 4 to 5 persons. On each station, 2 students were actors and 2 were observers. After a short briefing, students played a 15-minute scenario and then had a 15-minute debriefing.

The first station simulated the case of a 26-year old woman referred for suspected RP. Students were instructed to perform clinical history taking and

physical examination of the patient, formulated relevant diagnosis hypotheses and prescribe any additional necessary exams. Students had to suspect the diagnosis of idiopathic RP. The simulated patient was played by a trained facilitator with expertise on RP.
The second station simulated the case of a 56-year-old woman referred for RP complicated by digital ulcers. Students received the same instructions as before. They had to suspect the diagnosis of systemic sclerosis. The patient role was held by a real patient with systemic sclerosis, followed by the physician who was supervising the station, who had received prior training and who agreed to participate in this training.
At the end of the workshop, the students had to complete a satisfaction questionnaire.
Results: A total of 21 students participated in the workshop and 17 completed the survey. The students were "very satisfied" (Likert 4/4) of this training in 94%. They considered this workshop "not very stressful" (Likert 2/4) and "very formative" (Likert 4/4) in 71%, but "a little short" (Likert 2/4) in 88%. After taking this training, all students felt "a little" (Likert 3/4, 24%) or "much more comfortable" (Likert 4/4, 76%) to manage patients with idiopathic RP; and "a little" (Likert 3/4, 65%) or "much more comfortable" (Likert 4/4, 35%) to manage patients with systemic sclerosis. All would recommend this workshop to other students.
When asked about the strengths of this training, the students mentioned the benefits of being put in an immersive situation, which allowed for a better acquisition of practical skills (especially physical examination) and a more interactive exchange with teachers; as well as the confrontation with a real patient, which allowed for a better retention of semiologic findings and associated a relational component to this experience. The main weak points reported were its short duration and the stress induced by being observed during the simulation.
Conclusion: This workshop suggests the interest and feasibility on a small group of students of a rare diseases awareness workshop using role-play. The evaluation of its pedagogical efficiency and its generalization on large student promotions are being considered.

STIFF SPINE AND A WEAK HEART: A CASE OF LONG STANDING ANKYLOSING SPONDYLITIS DEVELOPING PULMONARY ARTERIAL HYPERTENSION SECONDARY TO MIXED CONNECTIVE TISSUE DISEASE, CONFERRING POOR PROGNOSIS

C. Dharmapalaiah[1], B. Ms[2], P. Sn[2]. [1]*Aster CMI Hospital, Hebbal Bangalore, Rheumatology, Bengaluru, India*; [2]*Aster CMI Hospital, Hebbal Bangalore, Internal Medicine, Bengaluru, India*

Background: Spondyloarthritides (SpA) and Connective Tissue Diseases (CTD) are considered distinct entities with diverse clinical features and genetic characteristics. There are very few case reports[1] of SpA coexisting with CTDs like Lupus, Scleroderma and Morphoea. Drugs used in treating SpA like Sulphasalazine and anti TNF drugs can also induce CTD.
Objectives: We report a case of a patient with eleven years history of Ankylosing Spondylitis (AS), presenting with Mixed Connective Tissue Disease (MCTD) and Pulmonary Arterial Hypertension (PAH) constituting a therapeutic challenge.
Methods: A 36 year old gentleman was diagnosed with AS at the age of 25 years, fulfilling the ASAS criteria (chronic inflammatory back pain, sacroiliitis on radiograph, HLAB27 positive). He was treated with NSAIDs, Sulphasalazine (SSZ) and physical therapy since 2008. There was gradual progression of his arthritis with high BASDAI along with recurrent anterior uveitis. He was treated with 5 doses of IV Infliximab 3mg/kg, between 2017 and early 2018. In May 2018, following further Infliximab he developed a serum sickness like reaction which was thought to be HACA response to Infliximab. He responded to IV hydrocortisone and antihistamines and Infliximab was discontinued.
In February 2019 he developed severe flare up of peripheral arthritis. He was treated with Injection Adalimumab 40mg every 2 weeks along with Latent TB prophylaxis with Isoniazid and Rifampicin. He received 4 doses to no effect and was discontinued.
In April 2019 Methotrexate (MTX) was added for peripheral arthritis. He discontinued both MTX and SSZ in July 2019 due to inefficacy. Peripheral arthritis responded well to Leflunomide that was started in September 2019.
There was an unexpected turn of events in October 2019, when he was admitted with severe dyspnoea and cough with new onset raynauds, skin tightening over forearms and nape of neck with salt and pepper appearance of skin at these sites (Images). He was hypoxic requiring oxygen support. Echocardiogram showed moderate pericardial effusion and pulmonary hypertension (PASP 60mmHg), dilated right heart and pulmonary artery. Pulmonary embolism was excluded on a CT pulmonary angiogram

Figure 1. Image 1, 2 – "salt and pepper" appearance of skin over the wrist and nape of neck, small joint arthritis

Figure 2. Image 1, 2 – "salt and pepper" appearance of skin over the wrist and nape of neck, small joint arthritis

Results: Investigations revealed 3+ ANA speckled pattern, anti RNP/ Sm 3+, Rheumatoid Factor negative. CRP 45.7u/l, Hemogram, renal and liver function tests were normal.
Cardiac MRI showed minimal pericardial effusion with mildly dilated right ventricle, non-dilated left ventricle with LVEF (~44%).

Right heart catheterization confirmed PAH with Mean PAP 58mmHg, LVEDP 8mmHg, PCWP 15mmHg
A diagnosis of Mixed Connective Tissue Disease (MCTD) was made, associated with PAH and pericardial effusion.
He was started on Ambrisentan and Tadalafil for PAH. Hydroxychloroquine and Mycophenolate Mofetil were also added in view of the PAH being associated with CTD. The additional pericardial effusion confers a poor prognosis.
Conclusion: Association of Spondyloarthritides and Connective Tissue Disease is rare. There are very few case reports of their chance association, especially MCTD[2]. Our patient had been exposed to Sulphasalazine, Infliximab, Adalimumab and Isoniazid, all with a potential to induce an auto immune CTD. MCTD features have persisted despite drug withdrawal. This case may suggest routinely checking for ANA in SpA patients prior to initiating anti TNF drugs.

AB1275 HYDROCEPHALUS IN AUTOIMMUNE DISEASES: A SERIES OF CHALLENGING CASES

N. El Ghobashy[1]. [1]*Cairo University, Cairo, Egypt*

Background: Hydrocephalus can be a rare neurological manifestation but lethal complication of various SAIDs, including systemic lupus erythematosus (SLE), rheumatoid arthritis (RA), sarcoidosis, and primary vasculitis. The commonly used medical management programs based on the etiology of hydrocephalus are anti-inflammatory or anti infectious therapies, while surgical management such as ventriculoperitoneal shunts is effective most of the time (Wei Jetal.,2019).
Objectives: To analyze the diagnosis and managment of hydrocephalus associated with autoimmune diseases
Methods: A retrospective case series study was conducted at Rheumatology department.Cairo university.Files were retrieved from the hospital archives by screening records from Jan 2014to Jan2019. Medical records were screened for data regarding the clinical manifestation and outcomeof hydrocephalus associated with autoimmune disease.
Results: Case (1)Male patient 28 yrs old diagnosed a systemic lupus erythematosus The patient was controlled on low dose steroid and azathioprine. In 2019: the patient presented with headache and blurring of vision. Fundus examination showed grade 2 to 3 papilledema. MRI brain showed: Non obustrcutive hydrocephalus. MRA & MRV: normal laboratory investigation was done and showed consumed c3 & c4. ESR: 35mm/hour. Hb: 12.3g/dl. WBC:6.38 cells/cm3. normal liver and kidney function. Neurosurgery consultation was done and recommended urgent ventriculo –peritoneal shunt. follow up fundus showed improvement of papilledema. The patient was discharged on steroids 30mg and mycophenolate mofetyl: 2gram with improvement of his condition.Case (2)Female patient 22 yrs old diagnosed as systemic lupus erythematosus onset 2010. In 2018 she started to develop quadriparesis started in left side followed by Right side associated with attacks of Tonic colonic convulsions. MRI brain showed: Marked communicating hydrocephalus with markedly reduced cerebral hemisphere white matter. MRV & MRA: normal. Her laboratory investigation showed ESR: 49mm/h. HB: 10.3mg/dl, WBC: 5.9 cells/ mm3. Normal platelet count. normal liver & kidney function. Normal c3 & c4. neurosurgery consultation was done. Urgent ventriculoperitoneal shunt was done with improvement of her condition. The patient was discharged on solupred 20mg along with azathioprine.
Conclusion: VPS along with medical treatment with steroids and immunosuppresion represent an effective treatment protocol.

AB1276 NON-INTERFERON THERAPY OF CHRONIC HEPATITIS C IN A PATIENT WITH SYSTEMIC LUPUS ERYTHEMATOSUS AND SECONDARY SJÖGREN SYNDROME - CASE REPORT

I. Menshikova[1], Y. Pak[2], A. Rybaulina[3]. [1]*I.M. Sechenov First Moscow State Medical University (Sechenov University), Rheumatology Department of Clinical Hospital #1, Moscow, Russian Federation*; [2]*I.M. Sechenov First Moscow State Medical University (Sechenov University), Rheumatology department of University Clinical Hospital #1, Moscow, Russian Federation*; [3]*I.M. Sechenov First Moscow State Medical University (Sechenov University), Faculty Therapy Department, Moscow, Russian Federation*

Background: Hepatitis C virus infection is one of the most significant public health problems in the world. To date, the problem of selection of therapy is very relevant for patients with autoimmune diseases and chronic hepatitis C [1]. Patients with systemic lupus erythematosus (SLE) are forced to take different doses of steroids, often in combination with immunosuppressants (mycophenolate mofetil, azathioprine, etc.) even in the case of long-term remission. Such therapy for many years can contribute to the reactivation of hepatitis C.
Objectives: To describe a clinical case of the effectiveness of the combined use of interferon-free therapy and therapy of steroids in a patient with SLE, secondary Sjogren syndrome and chronic hepatitis C.
Methods: 56 years-old woman was admitted to the rheumatology department of Clinical Hospital No. 1 in December 2018 with the debut of SLE: photosensitivity, aphthous stomatitis, arthritis, pleurisy, sicca syndrome, leukopenia, ANA 1: 2560, antibodies to dsDNA 55.95 IU / ml, positive antiSS-A (Ro). At the same time, it became known that she was infected with hepatitis C virus in 1985 presumably. At the time of hospitalization, anti-HCV was positive, the virus genotype was 1b, the activity of the process was low (HCV RNA $6.6x10^4$, AST 33 U/L and ALT 25 U/L). The patient was prescribed corticosteroids (methylprednisolone 16mg/day) and hydroxychloroquine 400mg/day. In January 2019, after gastroenterologist, hematologist and infectious disease specialist advise, it was decided to conduct the patient a specific interferon-free antiviral therapy for chronic hepatitis C (a 24-week course with asunaprevir and daclatasvir), given the potential long-term glucocorticoid therapy, with the prospect of treating the patient with cytotoxic drugs, and the possibility of reactivation of chronic hepatitis C amid of immunosuppressive therapy for SLE and Sjogren syndrome.
Results: Low-disease activity of SLE was achieved in a month, and after 24-week course of antiviral therapy, there was no increase in SLE activity, and positive laboratory and clinical dynamics were noted.
Conclusion: Thus, the use of interferon-free therapy of chronic hepatitis C in patients with systemic lupus erythematosus and secondary Sjogren syndrome shows possible ways to safe treatment of this disease in patients with diffuse connective tissue diseases.

AB1277 AUTOANTIBODIES IN NLRP3-ASSOCIATED AUTOINFLAMMATORY DISEASE: A CASE REPORT AND LITERATURE REVIEW

L. Zhang[1], Y. Sun[2], Y. Li[1], W. Yu[1], Y. Wang[1], D. Wu[1], W. Zhang[1], M. Shen[1], R. Wang[2]. [1]*Peking Union Medical College, Beijing, China*; [2]*School of Basic Medicine Peking Union Medical College, Beijing, China*

Background: We present the first report of high-titer autoantibodies in *NLRP3*-associated autoinflammatory disease(*NLRP3*-AID).Because systemic autoinflammatory disease(SAID) is characterised by the lack of autoreactive T-cells or autoantibodies,we made a systemic review on the theme of autoantibody in SAID to clarify this phenomenon.
Objectives: We present the first report of high-titer autoantibodies *NLRP*3-AID, and discuss autoantibody in classical SAID.
Methods: We collected the clinical data of the patient with *NLRP3*-AID who had high-titer autoantibodies,and made a systemic review about autoantibody in SAID.
Results: A 38-year-old Chinese Han patient was definitely diagnosed as *NLRP3*-AID because of cold-triggered urticaria-like rash and fever,arthralgia,-binaural sensorineural deafness,chronic meningitis,high inflammatory marker and de novo *NLRP3* T348M variant. Figure 1 shows pedigree of the patient. Meanwhile,she had positive antinuclear antibody(ANA) with a nucleolar pattern of 1:160, positive anti-β2GPI antibody 54-68 AU/ml (normal range < 20 AU/ml) and positive lupus anticoagulant 1.24-1.29 (normal range ≤ 1.2). Literature review found that 13 articles reported autoantibodies in Familial Mediterranean fever (FMF), and there was no autoantibody reported in hyperimmunoglobulinemia D syndrome (HIDS),TNF receptor–associated periodic syndrome(TRAPS) and *NLRP3*-AID. The prevalence of ANA,anti-dsDNA,RF and anti-CCP in patients with FMF was similar to healthy controls.

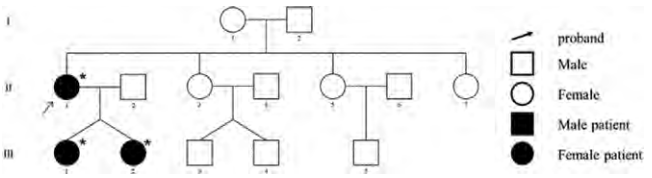

Fig. 1. Pedigree of the patient. The black arrow indicates the proband. The asterisks indicate the individuals who had clinical manifestations and carry the NLRP3 T348M variant.

Conclusion: Patients with *NLRP3*-AID can have high-titer ANA and APLs by accident. If patients with high-titer autoantibodies have characteristic manifestations of SAIDs instead of typical features of autoimmune diseases, we should make the final diagnosis through detailed investigation and genetic testing.

AB1278 A CASE REPORT OF TOCILIZUMAB INDUCE RAPID REMISSION OF ADULT-ONSET STILL'S DISEASE WITH LIFE-THREATENING INTERSTITIAL LUNG DISEASE AND MACROPHAGE ACTIVATION SYNDROME

G. Zhang[1], W. Liu[1], T. Xu[1], X. Zhang[1]. *[1]Guangdong Provincial People's Hospital/Guangdong Academy of Medical Sciences, Rheumatology, Guangzhou, China*

Background: Adult-onset still's disease (AOSD) is a systemic inflammatory condition characterized by fevers, polyarthritis, skin rashes and increased leukocyte and neutrophil counts [1]. Sometimes life-threatening complications such as macrophage activation syndrome (MAS), disseminated intravascular coagulopathy (DIC) can be occurred without response to glucocorticoid and disease-modifying antirheumatic drugs (DMARDs).
Objectives: To describe an AOSD patient with life-threatening interstitial lung disease (ILD) and MAS response to tocilizumab.
Methods: This is a case report at our medical practice.
Results: A 43-year-old man was hospitalized for a 2-week history of fever accompanying skin rashes, polyarthritis, sore throat, leukocytosis (the maximum leukocyte count 37.25×10^9/L with 89.9% neutrophils), elevated levels of C-reactive protein (190.9mg/L) and ferritin level was very high (>15000ng/ml), Several antibiotics were consequently used, but fever was on going. Chest CT displayed diffuse interstitial lung disease. Infectious diseases and lymphoma were excluded and AOSD with ILD was diagnosed. However, MAS occurred the 20 days later after the pulse of intravenous MP (MP 500mg×3days) following MP 40 mg/day, which cannot stop the situation deteriorating. The minimum total white blood cells, hemoglobin and platelets went down to 0.25×10^9/l, 53g/l and 18×10^9/l. Finally, tocilizumab rescued this patient from desperation.
Conclusion: Tocilizumab was effective in AOSD with life-threatening ILD and MAS.

HPR Measuring health (development and measurement properties of PROs, tests, devices)

AB1279-HPR A DESCRIPTIVE STUDY RELATED TO THE ADHERENCE BEFORE AND AFTER ENROLLING IN A MULTIDISCIPLINARY EDUCATIONAL PROGRAM

D. Buitrago-Garcia[1], F. Rodriguez[2], G. Sánchez[1], P. Santos-Moreno[3]. *[1]Fundación Universitaria de Ciencias de la Salud, Epidemiology, Bogota, Colombia*; *[2]Biomab - Center for Rheumatoid Arthritis, Patient Education Program, Bogota, Colombia*; *[3]Biomab - Center for Rheumatoid Arthritis, Rheumatology, Bogota, Colombia*

Background: Rheumatoid arthritis (RA) is an inflammatory, chronic disease. It leads to deformity and destruction of joints through the erosion of cartilage and bone. Patients with RA report to suffer symptoms in hands, joints, swelling, loss of motion, muscle weakness among others.(1).Centers of excellence in RA have proposed a multidisciplinary model of care with an initial diagnosis, treatment prescription and follow-up with a rheumatologist, periodic consultations with a physiatrist, psychologist, physiotherapist, occupational therapy, nutrition and a patient focused program(2). With this model of care, the patient is seen as a whole, and the expectation is to achieve the best results in the management of RA. However, if the patient does adhere the model becomes ineffective.
Objectives: The aim of this to report the attendance to a multidisciplinary model of care for patients with RA that attend to a specialized center in Colombia, before and after enrolling in a educational program.
Methods: We performed a descriptive study. Patients enrolled our educational program in July 2019. In our institution patients are followed-up under T2T standards and a multidisciplinary approach, as part of our model of care they have periodic consultations with a rheumatology, physiatrist, psychologist, physiotherapist, occupational therapy and nutrition. We collected sociodemographic data, DAS28, and compare the attendance to each specialty at the beginning and at 6-month follow-up. Descriptive epidemiology was done, we calculated means, and standard deviations for continuous variables and categorical variables were presented as rates. We compared disease activity and adherence at the beginning of the program and after six months of attendance.
Results: We included 229 patients; mean age was 59 years ±10; 93% were female. At the beginning of our program, mean DAS28 was 2.57 ± 1.19, from all patients 65% were at remission, 11% at low disease activity 19% at moderate disease activity and, 5% at severe disease activity. Regarding adherence to our model, the medical specialty with the highest attendance was rheumatology (30%) followed by, physical therapy (16%) physiatrist consultation (15%) psychology (13%) and, occupational therapy (11%); the specialty with the lowest attendance was nutrition (8%). After six months of attendance to the educational program, we found an increasing number of patients in remission 67%, low disease activity 15%, moderate disease activity 18%, we did not have patients with severe DA28. Regarding the medical specialties, we found a 3% rise in the attendance to the nutrition consultation and psychology consultation. We did not find statistical association between disease activity and adherence to the model.
Conclusion: These results are a clear example of how an educational program is capable of increasing awareness and improving the clinical outcomes and adherence to a multidisciplinary model for approaching RA. As other studies have shown(3), patient education interventions improve adherence to medication and to attendance to health care specialists.

AB1280-HPR REQUIRED FORCE TO OBTAIN A POSITIVE SQUEEZE TEST AUTOMATIZED IN PATIENTS WITH HAND ARTHRALGIA

M. M. Castañeda-Martínez[1], G. Figueroa-Parra[1], D. Vega-Morales[1], B. R. Vázquez Fuentes[1], Y. G. Ordoñez Azuara[2], J. A. Esquivel Valerio[1], D. Á. Galarza-Delgado[1]. [1]*University Hospital "Dr. José Eleuterio González", Rheumatology Service, Monterrey, Mexico*; [2]*University Hospital "Dr. José Eleuterio González", Family Medicine Service, Monterrey, Mexico*

Background: Primary care physicians (PCP) are usually the first contact of people with inflammatory rheumatic diseases, and find the early symptoms of Rheumatoid Arthritis (RA) difficult to distinguish from those of other rheumatic diseases. A time-delay in the reference to Rheumatology is a health issue in several countries. The clinical aspects that general practitioner took into account in hand arthralgia patients are important to make the reference. In particular the Squeeze Test (ST) - which is simple to perform and rapidly done, ST is useful for identifying progression to RA in patients with undifferentiated arthritis. The ST has been described as not reliable because is clinician-dependent.

Objectives: To identify the required force that needs to be applied in order to obtain a positive Automatized Squeeze Test (AST) in a cohort of patients with hand arthralgia.

Methods: Ninety-seven patients were recruited in Family Medicine Consultation and in Rheumatology Consultation of the Hospital Universitario "Dr. José Eleuterio González" in Monterrey, Nuevo León, México. Eligible patients were adults (aged≥18 years) with hand arthralgia (that wasn't caused by trauma) as their chief complaint. After obtaining informed consent and after a questionnaire application, patients were submitted to AST maneuver, using an automated compressor with different forces already predetermined in the interface of the software used for compression.

Results: In this cohort of 98 patients, 79 (80.6%) were women. The mean age was 51.14 years (SD 14.66). Ninety-six (97.9%) patients were right handed. The diagnoses were Osteoarthritis (OA) (16.3%), RA (5.1%), Undifferentiated arthritis (1.2%), Psoriatic arthritis (1.2%) and Fibromyalgia (2%). Force measures according to diagnoses are reported in Table 1.

Table 1. Diagnoses and mean forces

Diagnosis	n (%)	Right hand force mean (kg/s^2) (SD)	Left hand force mean (kg/s^2) (SD)
OA	16 (16.3)	3.53 (2.74)	3.18(2.73)
RA	5 (5.1)	3.60 (2.53)	3.16(1.36)
UA	1 (1.2)	7.60(0)	8.70(0)
PsA	1 (1.2)	7.60(0)	7.80(0)
FM	2 (2.0)	4.11(4.40)	1.75(1.06)

OA, Osteoarthritis; **RA**, Rheumatoid Arthritis; **UA**, Undifferentiated Arthritis; **PsA**, Psoriatic Arthritis; **FM**, Fibromyalgia; **SD**, Standard Deviation

Conclusion: In the cases of RA and OA, the means of force to obtain a positive AST was lower than in the rest of the diagnoses.

AB1281-HPR THE LEVELS OF VITAMIN D IN THE SPONDYLOARTHRITIS. DOES THE DEFICIT CORRESPOND TO THE INFLAMMATORY ACTIVITY?

D. Castro-Corredor[1], M. A. Ramírez Huaranga[2], A. I. Rebollo Giménez[2], M. D. Mínguez Sánchez[2], J. Anino-Fernández[2], I. M. De Lara Simón[3], J. L. Cuadra Díaz[2]. [1]*Hospital General Universitario Ciudad Real, Ciudad Real, Spain*; [2]*Hospital General Universitario Ciudad Real, Rheumatology Department, Ciudad Real, Spain*; [3]*Hospital General Universitario Ciudad Real, Pathology Department, Ciudad Real, Spain*

Background: Spondyloarthritis is a group of chronic inflammatory diseases with involvement of the axial skeleton (mainly), and also of peripheral joints. Patients with spondyloarthritis have a significant prevalence of vitamin D levels below normal and that would correlate with the degree of activity of the disease.

Objectives: To determine the association between vitamin D deficiency and the degree of activity of the disease (inflammatory activity) in a cohort of patients with spondyloarthritis.

Methods: Case-control type analytical observational study. We propose a retrospective review of the database of patients with spondyloarthritis (according ASAS2010 criteria) who were treated in the outpatient clinics of the Rheumatology Service of the General University Hospital of Ciudad Real during June 2018 to June 2019. Patients with the data will be selected. necessary for the analysis of the variables under study. The numerical variables of normal distribution evaluated will be described using measures of frequency and measures of central tendency / dispersion as appropriate. To assess the association between vitamin D levels and activity index, the odds ratio (OR) is calculated, with a 95% confidence level and the T-student for related samples.

Results: The final results of the study are presented. 115 patients were analyzed, of which 64 were men and 51 women, with an average age of 45.97 years (+/- 13.41 DE). 47% were ankylosing spondylitis, 21% psoriatic arthropathy, 16% undifferentiated spondyloarthritis, 7% spondyloarthropathy associated with inflammatory bowel disease and 9% were spondyloarthropathy associated with inflammatory bowel disease. The average of the activity was a BASDAI of 4.57 (+/- 2.35 SD) and measured by DAPSA was 12.61 (+/- 6.76 SD). 63 and 14 patients had activity measured by BASDAI and DAPSA, respectively. 49.56% patients presented an elevation of acute phase reactants. Vitamin D levels were 23.81 (+/- 10.5 SD). 77.4% presented figures of vitamin D deficiency or insufficiency. When performing the association analysis, the vitamin D deficit / insufficiency presented an OR 10 (95% CI: 3.66-27.29, p=<0.0001) with the degree of activity measured with BASDAI and DAPSA and against the elevation of RCP it was 3.63 (95% CI 1.43-9.25, p = 0.0092) and against the elevation of ESR it was 2.76 (95% CI 1.09-7, 0, p = 0.0438). Regarding the comparative analysis of means between vitamin D deficiency/insufficiency and BASDAI/DAPSA it was +3.29 (95% CI: 1.34-8.09, p=0.0084).

Conclusion: Patients with spondyloarthritis, as in other autoimmune diseases, vitamin D deficiency is associated with increased inflammatory activity (BASDAI, DAPSA, RCP and ESR), measured in different time periods. Therefore, an optimization of vitamin D levels can imply an improvement in the patient's clinical situation, measured by both BASDAI and DAPSA, as well as by RCP and ESR. In addition, it is necessary to monitor bone mineral density due to the risk of fracture in these patients for their multietiology (corticosteroid treatments, biological FAMEs, inflammatory activity).

AB1282-HPR CONCORDANCE BETWEEN TUBERCULIN TEST AND INTERFERON-GAMMA RELEASE ASSAY IN THE SCREENING OF LATENT TUBERCULOSIS INFECTION IN PATIENTS WHO ARE GOING TO INITIATE A TNF INHIBITOR

M. D. M. Cutillas Perez[1], C. Marin Silvente[1], E. Saiz[1], M. F. Pina[1]. [1]*Meseguer General University Hospital Morales, Murcia, Spain*

Background: The drugs that inhibit tumor necrosis factor (anti-TNF) alpha can reactivate a latent tuberculosis infection (ILTB) so requiring a rigorous screening before its onset. The tuberculin test (PT) has a high false negative rate in patients with immunomediated rheumatic diseases (IMID) and false positive in patients vaccinated with Bacillus Calmette Guérin (BCG). The neu methods of interferon gamma release (IGRA) seem to solve this problem, but its use is not standardized.

Objectives: Establish the degree of concordance in the diagnosis of ILTB between PT and IGRA in patients who are going to star an anti-TNF drug, in general, and in different situation like taking corticosteroids, being treated with disease modifying drugs, have been vaccinated with BCG or have risk factor for ILTB.

Methods: From May 2016 to November 2019, 195 patients with IMID who underwent ITLB screening prior to the initiation of an anti-TNF drug were included in this study. The concordance between PT and IGRA was calculated using the cohen's kappa index, for the general sample first and then for subgroups. An analysis of the factor that influence the result of PT and IGRA has also been carried out.

Results: The prevalence of ILTB was 26.7%. Of the total positive PT and Booster (n=50), QTF-G-IT was positive only in 15 patients (30%). The agreement between PT and QTF-G-IT was 0.33 (p<0.05). In the subpgroups, a moderate agreement was found in patients who did not take corticosteroids (k=0.45, p<0,05) and greater than the global one in those who had risk factor for ITLB (k=0.37, p<0.05).
Conclusion: In our study the agreement between PT and QT-G-IT is low in general, being somewhat higher in unvaccinated patients and with a high probability for ILTB. Taking this result into account due to the low concordance, the ideal ILTB screening strategy in patients who are going to start a anti-TNF would consist of performing both tests.

AB1283-HPR GASTROINTESTINAL INVOLVEMENT AND QUALITY OF LIFE IN A COHORT OF SYSTEMIC SCLEROSIS (SSC) PATIENTS

K. El Aoufy[1], I. Antola[2], C. Sciortino[2], S. Bellando Randone[3], S. Guiducci[1], D. Furst[1,4,5], M. Matucci-Cerinic[1]. *[1]University of Florence, Department of Experimental and Clinical Medicine, Florence, Italy*; *[2]University of Florence, Florence, Italy*; *[3]University of Florence, Department of Experimental and Clinical Medicine, Florence, Italy*; *[4]University of Washington, Seattle, Washington, United States of America*; *[5]Division of Rheumatology, UCLA, Los Angeles, California, United States of America*

Background: SSc is an autoimmune disease characterized by fibrosis of the skin and several internal organs involvement. The gastro intestinal tract is often affected causing a wide symptomatology that can involve the oesophagus, stomach and/or intestine.
Objectives: To assess the gastro-intestinal tract with the UCLA SCTC GIT 2.0 questionnaire and the adherence to the Mediterranean diet with the Mediterranean Diet Score in a cohort of SSc patients.
Methods: 18 SSc patients classified with ACR/EULAR criteria (limited and diffuse subsets) were enrolled from January to April 2019, from the outpatient clinic of the University of Florence, Division of Rheumatology, Careggi Hospital. UCLA SCTC GIT 2.0 questionnaire for gastro-intestinal involvement (range 0-3), Mediterranean Diet Score (MDS range 0-14) for adherence to the Mediterranean diet, Health Assessment Questioning (range 0-3) for disability and SF-36 (range 0-100) for the quality of life were administered to patients. Data on weight and height were collected for the calculation of the Body Mass Index (BMI).
Results: *the* 18 SSc patients included had an average BMI of 23.9 ± 4.7 (M ± SD): only one patient was underweight (BMI=16.6) and 4 patients were overweight (BMI> 25). *O*ur results show good adherence to the Mediterranean diet with a score of 9.78 ± 2.24 (M±SD) to the MDS. The quality of life assessed by SF-36 show scores were below the cut-off (<50), showing an impaired quality of general life (mental summary index = 36.32 ± 11.35 and physical summary index = 39.53 ± 8.61). Patients disability, assessed by HAQ, reports some difficulty in carrying out daily life activities due to the disease (0.52 ± 0.53- M ± SD).
Gastro-intestinal involvement, measured with the UCLA GIT 2.0 questionnaire, shows moderate symptoms (0.50-1.00) in most items (reflux, abdominal distension, social function and emotional well-being), while a lower score (0.00-0.49) it was found in other items (diarrhea, constipation and faecal incontinence). Therefore, the total score of gastrointestinal involvement is moderate (0.42 ± 0.38 M ± SD)**.**
Conclusion: *In SSc,* Gastrointestinal involvement has a significant impact on quality of life, influencing the eating habits and sometimes leading to nutritional deficiencies. Further studies to analyse the eating habits of SSc patients are needed.

AB1284-HPR RELIABILITY OF STEP TEST IN SUBJECTS WITH TOTAL KNEE ARTHROPLASTY

M. Eymir[1], E. Yuksel[1], B. Unver[1], K. Sevik[1], V. Karatosun[2]. *[1]Dokuz Eylul University, School of Physical Therapy and Rehabilitation, Izmir, Turkey*; *[2]Dokuz Eylul University, Department of Orthopedics and Traumatology, School of Medicine, Izmir, Turkey*

Background: Patients with TKA show impairments in standing balance up to 1 year after surgery. The impaired standing balance in TKA patients was found to be associated with falls risk and decreased functional level. Assessing of standing balance with objective and reliable assessments tools would therefore be extremely useful for determining accurate exercise program, and risks of falling, especially during the rehabilitative period when ambulation is at its most unsteady (1, 2). The stepping maneuver requires adequate strength and motor control to stabilize the body over the stance limb while the other leg is stepping, therefore the Step Test (ST) provides significant information for dynamic standing balance and lower limb motor control (3). The reliability of ST is reported in patient groups such as stroke, however, there is not any study that investigates the reliability of ST in patients with TKA in the current literature.
Objectives: The purposes of this study were to determine the test-retest reliability and the minimal detectable change (MDC) of the ST in patients with TKA.
Methods: 40 patients with TKA due to knee osteoarthritis, operated by the same surgeon, were included in this study. Patients performed trials for ST twice on the same day. Between the first and second trials, patients waited for an hour on sitting position to prevent fatigue. The ST assesses an individual's ability to place one foot onto a 7.5-cm-high step and then back down to the floor repeatedly as fast as possible for 15 seconds. The score is the number of steps completed in the 15-second period for each lower extremity. Scores for each lower extremity were recorded separately. Prior to the testing, the ST was demonstrated by the tester and all participants were allowed to a practice trial.
Results: The ST showed an excellent test-retest reliability (ICC2,1=0.95) in this study. Standard error of measurement (SEM) and MDC_{95} for ST were 0.37 and 1.02, respectively.
Conclusion: This study found that the ST has an excellent test–retest reliability in patients with TKA. It is an effective and reliable tool for measuring dynamic standing balance and participant falls. As a performance-based clinical test, the ST is easy to score, can be applied in a short time as part of the routine medical examination. Therefore, inclusion of ST into a more comprehensive battery of

performance-based measures of standing balance and lower limb motor control function in subjects with TKA should be considered.

AB1285-HPR ACCELEROMETRIC ASSESSMENT OF PHYSICAL PERFORMANCE DURING THE SIT-TO-STAND TEST IN PATIENTS WITH KNEE OSTEOARTHRITIS

S. Fellous[1], H. Rkain[1], S. Afilal[1], J. Moulay Berkchi[1], T. Fatima Zahrae[1], A. Ilham[1], T. Latifa[1], S. Aboudrar[2], T. Dakka[2], L. Errguig[2], A. Jniene[2], M. Bakkali[2], F. Allali[1]. *[1]Faculty of Medicine and Pharmacy of Rabat, Mohammed V University, Rabat, Department of Rheumatology B, El Ayachi Hospital, Rabat, Morocco*; *[2]Faculty of Medicine and Pharmacy of Rabat, Mohammed V University, Rabat, Physiology Laboratory, Rabat, Morocco*

Background: Knee osteoarthritis is a major public health issue that causes chronic pain and functional limitation.

Objectives: This study aims to evaluate physical performance in knee osteoarthritis by clinical tests and accelerometer measurements, and investigate the relationship between physical perfomance alteration and clinical parameters.

Methods: This is a cross-sectional study, included 40 patients with knee osteoarthritis (100% female, average age 57.6 ± 5.2 years, median evolution time was 36 [24, 69] months, overweight in 82.5% of patients). Clinical evaluation performed with the visual analog scale (VAS), Western Ontario and McMaster Osteoarthritis Index (WOMAC), Lequesne score, Get up and Go (GUG) and Timed up and Go (TUG) tests. The percentage of fat mass was measured using impedencemetry.

All subjects were instructed to perform sit-to-stand transfers during 30 secondes. We measured the speed, strength and muscular power of the lower limbs during this test using the Myotest PRO® accelerometer.

A correlation analysis was performed in search of factors associated with physical performance alteration.

Results: The median speed during the sit-to-stand test was 4.3 [3.1-6.2] cm / sec. The median muscular strength and power during this test were 15.2 [13.6-17.7] Nm / kg and 14.5 [9.9-21.7] W / kg respectively.

Body mass index (BMI) correlated negatively with the 3 parameters of physivcal performance mesured by the Myotest PRO® accelerometer (speed, strength and muscle power) during the sit-to-stand test (p<0,05). There was no correlation between those measured parameters of physical performance, pain and functional indices of knee osteoarthritis.

Conclusion: Our pilot study assessed the physical performance of the lower limbs in knee osteoarthritis patients, by measuring the speed, strength and muscle power during the the sit-to-stand test. It suggests an association between obesity and physical performance alteration in knee osteoarthritis patients.

AB1286-HPR EXAMINATION OF DYNAMIC GRIP ENDURANCE RELATED FACTORS IN PATIENTS WITH PSORIATIC ARTHRITIS

İ. Naz Gürşan[1], M. Köprülüoğlu[1], D. Solmaz[2], S. Akar[2]. *[1]Izmir Katip Celebi University, Faculty of Health Sciences, Department of Physiotherapy and Rehabilitation, Izmir,Turkey*; *[2]Izmir Katip Celebi University, Faculty of Medicine, Department of Rheumatology, İzmir,Turkey*

Background: Psoriatic arthritis (PsA) is a disease manifested by destruction of articular cartilage, subchondral bone, and fibrosis of the joint capsule without excessive synovitis (1). Most of studies that examining hand in PsA are radiographic, ultrasonographic, magnetic resonance imaging research and there is little knowledge about functional assessment of hand. According to our knowledge, there is no study assessing grip endurance in patients with PsA.

Objectives: To assess dynamic grip endurance related factors in patients with PsA.

Methods: A total of 19 patients [Mean age; 53.5±12.6 years, 14 women(73.7%), 5 men(26.3%)] diagnosed according to CASPAR criteria were included this study. Clinical and demographic characteristics were recorded. Dynamic grip endurance test was assessed with 10- repetition dynamic endurance test using a hand dynamometer (Lafayette Proffessional Hand Dynamometer, USA). Grip strength was examined by hand dynamometer and pinch strength was examined by pinchmeter (Lafayette, USA). Goniometer was used to assessment wrist position sense. Disability of Arm, Shoulder and Hand Survey (DASH) was used to determine disabilities and symptoms of upper extremity. We used Spearman's Rank Correlation Coefficient for data analysis.

Results: Dynamic grip endurance was negatively correlated with DASH score, perceived disability of hand, number of tender hand joints and positively correlated with grip strength, 3 point pinch strength on both dominant and non-dominant sides (p<0.05, Table 1). Dynamic grip endurance was not correlated with CRP level and joint position error on both dominant and non-dominant sides (p>0.05).

Table 1. Examination Of Dynamic Grip Endurance Related Factors In Patients

Variables (n=19)	Dynamic Grip Endurance Dominant	Dynamic Grip Endurance Dominant (%)	Dynamic Grip Endurance Non- Dominant	Dynamic Grip Endurance Non-Dominant (%)
DASH	**r=-0.525**	**r=0.524**	**r=-0.608**	r=0.153
	p=0.021	**p=0.021**	**p=0.006**	p=0.532
Perceived Disability	**r=-0.466**	r=0.326	**r=-0.509**	r=0.414
of Hand	**p=0.044**	p=0.174	**p=0.026**	p=0.078
Pain in Hand Joints	r=-0.363	**r=0.472**	r=-0.316	**r=0.542**
	p=0.127	**p=0.041**	p=0.188	**p=0.017**
Number Of Tender	**r=-0.641**	**r=0.569**	**r=-0.580**	r=0.268
Hand Joint	**p=0.003**	**p=0.011**	**p=0.009**	p=0.267
Number Of Swollen	r=-0.349	r=0.359	**r=-0.526**	r=-0.094
Hand Joint	p=0.143	p=0.131	**p=0.021**	p=0.702
Joint Position Error	r=0.147	r=-0.127	r=0.412	r=-0.026
Dominant	p=0.548	p=0.606	p=0.080	p=0.915
Joint Position Error	r=0.213	r=-0.339	r=0.047	r=0.350
Non-dominant	p=0.381	p=0.156	p=0.848	p=0.141
Grip Strength	**r=0.960**	r=0.033	**r=0.722**	r=-0.035
Dominant	**p<0.001**	p=0.892	**p<001**	p=0.887
Grip Strength	**r=0.742**	r=-0.151	**r=0.967**	r=0.035
Non- Dominant	**p<0.001**	p=0.538	**p<0.001**	p=0.887
2 Point Dominant	r=0.134	**r=-0.561**	r=0.344	r=-0.240
	p=0.585	**p=0.012**	p=0.149	p=0.322
3 Point Dominant	**r=0.539**	r=-0.444	**r=0.752**	r=-0.318
	p=0.017	p=0.057	**p<0.001**	p=0.185
Lateral Dominant	r=0.354	**r=-0.516**	r=0.355	r=-0.116
	p=0.137	**p=0.024**	p=0.136	p=0.637
2 Point	**r=0.622**	**r=-0.200**	**r=0.742**	r=0.031
Non-Dominant	**p=0.004**	**p=0.411**	**p<0.001**	p=0.901
3 Point	**r=0.633**	r=-0.216	**r=0.845**	r=0.013
Non Dominant	**p=0.004**	p=0.375	**p<0.001**	p=0.957
Lateral	**r=0.459**	r=-0.366	**r=0.579**	r=-0.063
Non Dominant	**p=0.048**	p=0.123	**p=0.009**	p=0.783
CRP	r=-0.280	r=-0.008	r=-0.386	r=0.023
	p=0.246	p=0.974	p=0.102	p=0.926

DASH: Disability of Arm, Shoulder and Hand Survey, *Spearman Correlation Test

Conclusion: Our findings suggest that dynamic grip endurance is associated with different functional parameters of the hand and worsening clinical parameters. Examining dynamic grip endurance might be a guide in creating an exercise program for clinicans in rehabilitation of patients with PsA.

AB1287-HPR INVESTIGATION OF THE RELATIONSHIP BETWEEN GRIP ENDURANCE, DISABILITY OF UPPER EXTREMITY AND QUALITY OF LIFE IN PATIENTS WITH RHEUMATOID ARTHRITIS

M. Köprülüoğlu[1], İ. Naz Gürşan[1], D. Solmaz[2], G. Kabadayi[2], H. Cinakli[2], S. Akar[2]. *[1]Izmir Katip Celebi University, Faculty of Health Sciences, Department of Physiotherapy and Rehabilitation, İzmir,Turkey*; *[2]Izmir Katip Celebi University, Faculty of Medicine, Department of Rheumatology, İzmir,Turkey*

Background: Upper extremity functions affect the quality of life at different levels in patients with rheumatoid arthritis (RA). In the current literature; it has been shown that grip endurance is associated with upper limb functions (1). However, there is no study investigating the relationship between grip endurance and quality of life in patients with RA.

Objectives: To investigate relationship between grip endurance, disability of upper extremity and quality of life in patients with RA.

Methods: In our cross sectional study, 23 RA patients [Mean age; 52.7±12.6, BMI;26.9±5.7 kg/m^2, Women;20(87.0%)] who were classified according to the ACR 2010 criteria. Demographics and clinical characteristics of patients were recorded (Table 1). Das28 for disease activity score, Static and dynamic grip endurance measurements using Hand Dynamometer (Lafayette Proffessional Hand Dynamometer, USA) for grip endurance, Disability of Arm, Shoulder and Hand Survey (DASH) for disabilities and symptoms of upper extremity and Short Form-36 Health Survey for quality of life were performed. Spearman's Rank Correlation Coefficient was used for data analysis.

Table 1. Demografic and Clinical Characteristics of Patients

Variables (n=23)	Median(IQR 25/75)
Age (year)	56(41/62)
BMI (kg/m2)	27,5(21.4/32.0)
Disease Duration(year)	8(5/15)
Morning Stiffness (VAS/mm)	38(23/48)
Perceived Disability of Hand (VAS,mm)	47(25/67)
Clinician Disability of Hand (VAS,mm)	30(20/39)
Number Of Tender Hand Joint	2(0/6)
Number Of Swollen Hand Joint	0(0/1)
CRP(mg l)	3,3(1.8/7.1)
ESR(nm/h)	13(6/21)
n(%)	
Morning Stiffness Duratton	
0-15 minutes	8 (34.8)
15-30 minutes	5 (21.7)
30-60 minutes	3 (13.0)
Longer than 1 hours	7 (30.4)
Das28	
Remission	11(47.8)
Low Activity	2(8.7)
Moderate Activity	7(30.4)
High Activity	3(13.0)

Data is presented median (interquantile range) or percentile (%).

Results: Grip endurance was negatively correlated with DASH and positively correlated with many different quality of life parameters, especially physical function, on both the dominant and non-dominant sides ($p < 0.05$). DASH was correlated negatively with SF-36 physical function, rol limitataion due to physical health, pain subparameters and positively correlated with Das28 score ($p<0.05$).
Conclusion: In our study, it was concluded that grip endurance was related to upper extremity functions and quality of life in patients with RA. This result shows that; assessment of grip endurance can be a guide for clinicians who have designed an upper limb rehabilitation program for patients with RA.

AB1288-HPR BURTON PATIENT REPORTED OUTCOME MEASURES (B-PROM): STEPS TOWARDS VALIDATION

R. Laxminarayan[1], A. Dean[2], H. Nutland[3], L. Bembridge[3], M. Bukhari[4]. *[1]Queens Hospital, University Hospitals of Derby and Burton Hospitals NHS Foundation Trust, Rheumatology, Burton upon Trent, United Kingdom*; *[2]Queens Hospital, University Hospitals of Derby and Burton Hospitals NHS Foundation Trust, Physiotherapy, Burton upon Trent, United Kingdom*; *[3]Queen's Hospital, Physiotherapy, Burton upon Trent, United Kingdom*; *[4]Lancaster Royal Infirmary, Rheumatology, Lancaster, United Kingdom*

Background: Patient reported outcome measure (PROMS) and experience measures (PREMS) are becoming of vital importance in the assemment of treating the rheumatic diseases. There have been a variety measuring different elements of a patients disease journey. To date few have been developed specifically in rheumatology outpatients, to that end the Burton rheumatology unit in the Midlands UK developed a 12 question PROM looking at the three domains of emotional, physical and functional health, this has been mindful of previois PROMS and PREMS developed [1,2,3].
Objectives: To validate a new PROM questionnaire in an unselected group of rheumatology outpatients with osteoarthritiss (OA)
Methods: Consecutive patients with OA attending outpatients in Burton were asked to fill in the questionnaire at the beginning and after completing education and exercise programme designed by the physiotherapists to treat OA. The results collated were analysed using STATA ™. Cronbach's alpha was calculated to look internal validity within domain and overall to assess validity of the questionnanire. This was done within domain and with the overall questionnaire.
Results: 130 patients were included, mean age was 65 and diagnosis was osteoarthritis. 71.5% patients were female. Cronbachs alpha results for the communication, relationship and reliability within the first domain were 0.80, 0.82 and 0.82 respectively. Domain 1: alpha for all three questions was 0.93. Domain 2: alpha for questions on knowledge was 0.60, reliability 0.81, fatigue 0.79 and pain 0.85. Domain two overall agreed with the other two domains was 0.95 . Domain 3: the alpha for movement was 0.81, strength was 0.73, independence was 0.81, mobility was 0.91 and social was 0.92. Domain three had an alpha overall of 0.93
Conclusion: The B-PROM shows good validity and could be used in patients with OA, further work using it on other patient groups will be performed.

AB1289-HPR PERCEPTION OF THE VALUE OF DRUGS ON DIFFERENT MANIFESTATIONS OF PSORIATIC ARTHRITIS BASED ON A MULTI-STAGE EXPERT OPINION SURVEY

T. Oberwahrenbrock[1,2], H. Tian[1,2], D. Thaçi[3], K. Krueger[4], J. Wollenhaupt[5], M. Köhm[1,2,6], F. Behrens[1,2,6]. *[1]Fraunhofer IME Translational Medicine and Pharmacology, Frankfurt, Germany*; *[2]Fraunhofer Cluster of Excellence Immune-mediated Diseases CIMD, Frankfurt, Germany*; *[3]Exzellenzzentrum Entzündungsmedizin UKSH Lübeck, Lübeck, Germany*; *[4]Rheumapraxis München, München, Germany*; *[5]Rheumatologikum Hamburg, Hamburg, Germany*; *[6]Goethe-University Frankfurt, Rheumatology Department, Frankfurt, Germany*

Background: Patients with psoriatic arthritis (PsA) present with heterogeneous clinical phenotypes, which includes different clinical manifestations such as peripheral arthritis, axial disease, dactylitis, enthesitis, and skin and nail psoriasis. Many drugs for treatment of PsA are available for individualised treatment strategies but robust evidence is available for peripheral arthritis only as primary endpoint of RCTs.
Objectives: To evaluate perception of German physicians on the value of current PsA treatments on different clinical PsA manifestations.
Methods: In a face-to-face meeting, 8 German physicians (dermatology, rheumatology), specialised in PsA research/patient care, proposed initial scores for the effect size of current PsA drugs on different PsA manifestations based on knowledge of study data and personal experience in use of the drugs. The ability to achieve a consensus of the proposed efficacy scores was explored by applying an online survey among a cohort of PsA experienced physicians. Finally, a second online survey evaluated how a larger group of physicians personally estimate the drug effect sizes on different PsA manifestations.
Results: Table 1 summarises the efficacy scores proposed by the initial expert group. In the first online survey 25 treating physicians were invited to participate, 14 (56%) of whom completed the survey. An agreement rate of over 65% of the participants was archived for 49 (68%) of the 72 proposed efficacy scores (Table 1). The consensus was especially high for the group of biological disease-modifying antirheumatic drugs (bDMARDs), except for etanercept and abatacept. However, the second survey (16 (39%) participants out of 41 invited physicians) revealed that the experience with the treatment using abatacept was low (4 / 16 (25%)) or non-existing (3 /16 (18.8%)) and several manifestations could not be estimated (Figure 1). Distribution of answers were broad for etanercept in general and for particular drug-manifestation combinations (e.g. effect of ustekinumab on axial disease).

Table 1. Efficacy scores proposed by a PsA expert group and consensus achieved by an online survey among PsA treating physicians Efficacy scores for different drugs and manifestations range from 0 (no effect) to 5 (maximal effect). Green fields indicate, that at least 65% of the survey participants agreed on the proposed efficacy score.

	Peripheral arthritis	Axial disease	Enthesitis	Dactylitis	Skin disease	Nail disease
Methotrexat	2.5	0	0	1	2.5	1.5
Sulfasalazin	1	0	0	0	0	0
Leflunomid	2.5	0	0	1	1	1
Apremilast	3	1	3	2.5	3	3
Etanercept	4	4	4	3.5	3	3.5
Infliximab	4	4	4	4	4	4
Adalimumab	4	4	4	4	4	4.5
Golimumab	4	4	4	4	3	3
Certolizumab pegol	4	4	4	4	4	4
Ustekinumab	3.5	2.5	4.5	3	4.5	4
Secukinumab	4	4	4	4	5	4.5
Abatacept	3.5	0	0	0	1.5	0

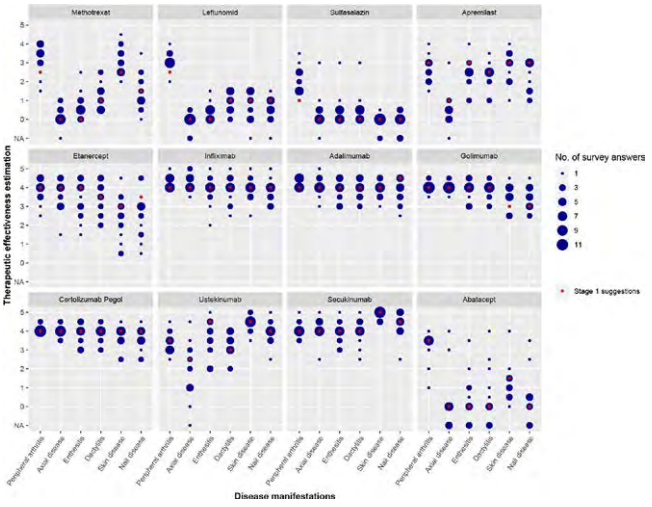

Figure 1. Results from an online survey among physicians querying their perception of efficacies of PsA drugs on different manifestations. Therapeutic effectiveness is estimated by the participants on a scale from 0 (no effect) to 5 (maximal effectiveness); NA = no answer. The size of the dots relates to the number of answers given. Red stars indicate the scores proposed by the initial expert group.

Conclusion: Many treatments are available to be used in PsA. The usage of treatment classes seems to depend on experience level and mode of action. Higher agreement on efficacy in specific diseases manifestation was achieved in the class of biologics whereas the opinion on efficacy of csDMARDs in general is divergent. Strategies are needed to guide physicians with lower level of experience in the use of specific drugs to achieve an optimised patient care level using personalized treatment strategies.

AB1290-HPR UTILITY OF FRAX IN THE RISK DETECTION OF FRACTURE IN SPONDYLOARTHRITIS

D. Palma Sanchez[1], A. Haro[1], M. J. Moreno[1], E. Peñas[1], M. Mayor[1], M. Moreno[2], L. F. Linares Ferrando[2]. *[1]H. Rafael Méndez, Rheumatology, Lorca, Spain*; *[2]H. Virgen de la Arrixaca, Rheumatology, Murcia, Spain*

Background: Axial spondyloarthritis (SpAax) presents an increased risk of vertebral fracture not fully detected by Dual energy X-ray absorptiometry (DXA). The FRAX algorithms give the 10-year probability of hip fracture and of mayor osteoporotic fracture (clinical spine, forearm, hip or shoulder fracture), taking into account 11 clinical risk factors.

Objectives: To analyze the suitability of FRAX to detect the risk of fracture in patients with SpAax. To assess whether the incorporation of SpAax as a clinical risk factor to conventional FRAX provides additional information.

Methods: Cross-sectional study in which SpAax patients (ASAS criteria) were included. Clinical-demographic and related to the disease variables were collected. FRIDEX model for Spanish population was used to determine low, intermediate or high risk of mayor fracture by FRAX. These results were compared with those obtained by DXA and trabecular bone score (TBS). In the statistical analysis we used mean and standard deviation (SD) in quantitative variables and frequency in qualitative ones. To compare means among 3 groups, ANOVA test was used.

Results: The characteristics of the patients are shown in Table 1. According to FRIDEX, no patient had high risk of fracture and 2.4% had intermediate risk. When SpAax was added as a risk factor, no patient had high risk of fracture and 6.1% presented intermediate risk. According to DXA, 7.3% had high risk of fracture and 41.3% intermediate risk. TBS detected high risk of fracture in 18.3% and intermediate risk also in 18.3% of patients.

Table 1. Sociodemographic, clinical and related characteristics with the disease (BMD: bone mineral density, BMI: index of body mass)

Gender (Male), n (%)	61 (74.4)
Age, mean ± SD	49.48 ± 12.47
BMI, mean ± SD	27.13 ± 4.42
Smoking, n (%)	26 (31.7)
Diabetes mellitus, n (%)	9 (11)
Osteoporotic fracture, n (%)	1 (1.2)
Disease duration (years), mean ± SD	11.77 ± 10
syndesmophytes, n (%)	38 (46.3)
ASDAS-PCR, mean ± SD	2.55 ± 1.07
Lumbar BMD (g / cm^2), mean ± SD	1.032 ± 0.180
BMD femoral neck (g / cm^2), mean ± SD	0.816 ± 0.140
Lumbar TBS, mean ± SD	1.383 ± 0.133

Conclusion: FRAX does not seem an adequate tool to detect the risk of fracture in patients with SpAax since it did not improve the results obtained by DXA meanwhile TBS did. The incorporation of SpAax as a clinical risk factor to conventional FRAX did not provide additional information in most cases

AB1291-HPR IMPLEMENTATION OF AN ELECTRONIC SYSTEM FOR ISSUING PRESCRIPTIONS IN PATIENTS WITH RHEUMATIC DISEASES

L. Santoyo-Fexas[1], R. A. Uriarte Botello[1], C. V. Solis[1], B. R. Vázquez Fuentes[1], C. M. Skinner Taylor[1], I. D. J. Hernandez-Galarza[1], M. Eguia Bernal[1], D. Á. Galarza-Delgado[1]. *[1]Hospital Universitario "Dr. José Eleuterio González", Rheumatology Service, Monterrey, Mexico*

Background: Pharmacovigilance is the science and activities related to detection, evaluation, understanding and prevention of adverse effects of medications or any other health problem related to them. (1)

Within the scope of the pharmacovigilance study, following domains are included: adverse drug reaction, interaction between medications, counterfeit or inferior quality medications, lack of efficacy of medications, misuse or abuse of medications and medication errors (ME). (2)

ME is any preventable incident that can cause harm to the patient or lead to improper use of medications when they are under the control of healthcare professionals or the patient. (3)

Objectives: To determine the frequency of ME in the prescriptions among rheumatology outpatient's clinic.

Methods: Prospective observational study.

Frequency of ME was sought by a randomized review of the prescriptions from rheumatology outpatient's clinic of the University Hospital "Dr. José Eleuterio González" before and after the implementation of an electronic medical prescription system (REPAIR®) (January 2018-December 2019)

REPAIR® displays an automated menu with the stages of the medical prescription: Name, presentation and dosage of the medicine and duration of the treatment. Figure 1. Once the review began, semiannual reports were made to the doctors involved in which frequency of errors and the stage of medical prescription with highest incidence of ME were reported.

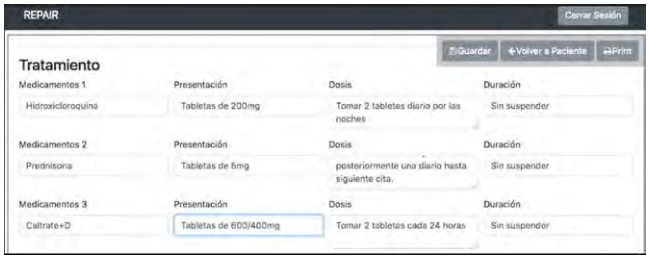

Figure 1 Example image displayed by REPAIR®

Descriptive statistics were performed, reporting frequencies and percentages.

Results: A total of 1599 medical prescriptions were evaluated. The number of prescriptions with ME was 196 (12.2%). Table 1

Table 1 General description about errors in medical prescriptions

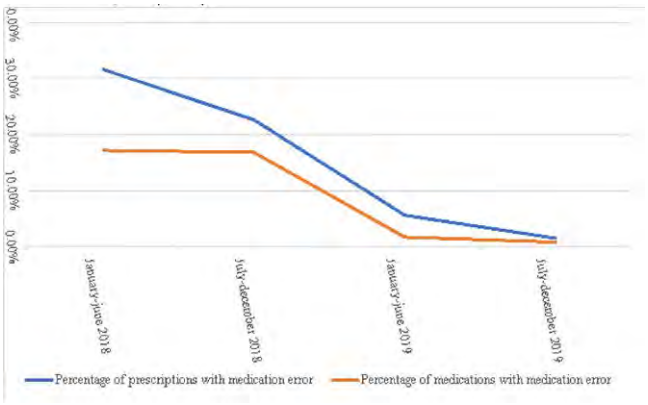
Prescriptions evaluated	1599
Prescription with ME n (%)	196 (12.2%)
Medications evaluated n	10 413
Medications with ME n (%)	907(8.7%)
Average medications per prescription	6.4
Average medications with ME per prescription	0.78
Prescription Stage	
Name of the drug n (%)	2/10 413 (0.01%)
Medication presentation n (%)	77/ 10 413 (0.7%)
Dose of the drug n (%)	0/10 413 (0%)
Duration of prescription n (%)	725/10 413 (6.9%)

The incidence of ME decreased, at beginning of the study incidence was reported 31.6%, and at the end were 1.5%. Graph 1

The percentage of medications with ME also decreased from 17.2% to 0.8% at the end of the study. Table 2

Table 2 Errors in prescriptions per semester

	January-June 2018	July-December 2018	January-June 2019	July-December 2019
Prescriptions evaluated n	321	411	407	460
Prescriptions with ME n (%)	73 (31.6%)	93 (22.6%)	23 (5.6%)	7 (1.5%)
Medications evaluated n	2126	2784	2680	2823
Medications with ME n (%)	367 (17.2%)	469 (16.8%)	36 (1.7%)	35 (0.8%)
Average medications per prescription evaluated	6.6	6.7	6.2	6.4
Average medications per prescription evaluated	1.146	1.143	0.082	0.081
Prescription Stage n (%)				
Name	1/367(0.2%)	1/469 (0.2%)	0	0
Presentation	37/367 (10%)	37/469 (7.8%)	1/36 (2.7%)	2/35 (5.7%)
Dose	0	0	0	0
Duration	290/367 (89%)	367/469 (88.2%)	35/36 (97.2%)	33/35 (94.2%)



Conclusion: Decrease in the incidence of ME in rheumatology consultation is important because outcome of the patients depends significantly on treatment adherence. This study results shows that through the application of an electronic prescription system, it is possible to reduce the incidence of ME in rheumatology consultation.

AB1292-HPR NUMBER OF DRUGS IN THE PRESCRIPTION, A PREDISPOSING FACTOR FOR MEDICATION ERRORS IN RHEUMATOLOGY

L. Santoyo-Fexas[1], R. A. Uriarte Botello[1], B. R. Vázquez Fuentes[1], C. V. Solis[1], C. M. Skinner Taylor[1], I. D. J. Hernandez-Galarza[1], M. Eguia Bernal[1], D. Á. Galarza-Delgado[1]. [1]*Hospital Universitario "Dr. José Eleuterio González", Rheumatology, Monterrey, Mexico*

Background: Medication error can be defined as a failure in the treatment process that leads to or has the potential to lead to harm to the patient, this fault can happen in two different phases: prescribing and prescription.

Prescribing is the process of deciding what to prescribe and naming it. Various types of faults can occur in the decision-making process: underprescribing, overprescribing, irrational, inappropriate and ineffective prescribing. All these covers one type of errors, but these are different kind of errors that those that occur in the act of writing a prescription. This leads to the distinct concepts of 'prescribing faults' and 'prescription errors'

A prescription is 'a written order, which includes detailed instructions of what medicine should be given, to whom, in what formulation and dose, by what route, when, how frequently, and for how long'. Thus, a prescription error can be defined as 'a failure in the prescription writing process that results in a wrong instruction about one or more of the normal features of a prescription'. The 'normal features' include the identity of the patient, the identity of the drug, the formulation and dose, and the route, timing, frequency, and duration of administration. (1)

It is not record about the rate of medication errors in rheumatology consultation.

Objectives: To evaluate whether there is a relationship between prescribing errors and the number of drugs in the prescription.

Methods: A descriptive, observational, and retrospective study was made.

It was carried out a random search of medical prescriptions, generated by the electronic records (REPAIR®) of the rheumatology consultation of the Hospital Universitario "Dr. José Eleuterio González" during 2019, in which the prescriptions that contained any error were identified

T student test was performed to see the difference in the prescription error based on the number of medications. P <0.05 was taken as statistically significant.

Results: A review of 867 medical prescriptions was performed, among which 5503 medications were indicated with an average of 6.34 medications per prescription, a total of 30 (6.9%) prescriptions were found with error, where a total of 71 (3.9%) medications had errors. In the prescriptions with medication error, all the errors were prescription type; 68 (95.7%) had a mistake in the duration of administration and 3 (4.22%) in the identity of the drug.

In the prescriptions with medical errors the average number of prescription drugs was 7.50, only 2/30 (0.6%) had less than 7 indicated medications (4 and 6), meanwhile the prescriptions in which no error was found had a mean of 6.30 indicated medications. P < 0.001.

Conclusion: According to the study findings, it could be established that when the number of prescribed medications is greater than 7, there is an increased risk of making a prescription error. Further studies should carry out to look for other factors that influence medical errors in rheumatology clinics.

AB1293-HPR **DETERMINING FUNCTIONAL MOBILITY AND BALANCE FOR PATIENTS AFTER TOTAL KNEE ARTHROPLASTY: RELIABILITY OF L-TEST**

B. Unver[1], E. Yuksel[1], M. Eymir[1], K. Sevik[1], V. Karatosun[2]. [1]*Dokuz Eylul University, School of Physical Therapy and Rehabilitation, Izmir, Turkey*; [2]*Dokuz Eylul University, Department of Orthopedics and Traumatology, School of Medicine, Izmir, Turkey*

Background: Total knee arthroplasty (TKA) is a very common procedure, particularly implemented for the treatment of knee osteoarthritis (OA). Patient expectations after TKA surgery now include being able to enjoy appropriate recreational activities representing ambulatory activities beyond that of just pain relief and adequate knee motion (1). Since recreational activity comprises of more complex functions and requires longer standing durations, walking for 6-meter in a straight line in the timed up and go test (TUG) does not fully reflect the functional capacity of patients with TKA, and TUG test may be limited to detect the balance and mobility capacity in TKA patients (2, 3). As such, there is a need to determine more effective and functional evaluation tools that better reflect realistic situations in order to assess ambulatory performance level for patients with TKA. However, no studies have been conducted in patients with TKA to examine the applicability of the L-test, which assesses ambulation of individuals and consists of complex mobilization activity.
Objectives: The purposes of this study were to determine the test-retest reliability and the minimal detectable change (MDC) of the L-test for TKA patients.
Methods: Twenty-four patients with TKA due to knee OA, operated by the same surgeon, were included in this study. Patients performed trials for L-test twice on the same day. Between the first and second trials, patients waited for an hour on sitting position to prevent fatigue. The tester recorded the performance time while the participant was asked to get up from a chair, walk 3 m in a straight line, turn right, continue walking for 7 m in a straight line, turn left, walk back along the same path and sit down in the chair at their usual walking speed. Prior to the real testing session, the L-test was demonstrated by the tester and all participants were allowed to a practice trial.
Results: The L-test showed an excellent test-retest reliability (ICC2,1= 0,98) in this study. Standard error of measurement (SEM) and MDC_{95} for L-test were 1,01 second and 2,8 second, respectively.
Conclusion: This study found that the L-test is a reliable test for patients following TKA. Overall, the excellent test-retest reliability of the L-test indicates that it may be an applicable standardized method to assess TKA patients who are able to walk greater distances and have better gait in more functional situations. Clinicians and researchers can be confident that changes in L-test time above 2,8 seconds, represent a "real" clinical change in an individual patient with TKA. We, therefore, recommend the use of L-test as complementary outcome measures for balance and functional evaluation in TKA patients.

AB1294-HPR **LOW CONCENTRATIONS OF BIOLOGIC DMARDS IN BREASTMILK OF PATIENTS TREATED DURING LACTATION**

A. Zbinden[1], K. Eriksson[1], F. Förger[1]. [1]*University Hospital and University of Bern, Inselspital, Department of Rheumatology, Immunology and Allergology, Bern, Switzerland*

Background: There is very limited information about the passage of biologics into breast milk and into the peripheral blood of breastfed infants. However, based on pharmacological properties of biologic DMARDs (bDMARDs) lactation may not be discouraged in patients with chronic inflammatory rheumatic disease to treat or prevent postpartum relapses. We here report two cases treated with bDMARDs during lactation: one woman with Muckle-Wells syndrome (MWS) treated with canakinumab and one woman with microscopic polyangiitis (MPA) treated with rituximab.
Objectives: To determine the level of rituximab and canakinumab in breast milk, in sera of breastfed infants as well as in sera of the mother and to calculate the average daily infant dose and the relative infant dose.
Methods: Serum and milk levels of Rituximab were measured by ELISA using commercially available coating and detection antibodies. For Canakinumab an ELISA was established by coating of plates with recombinant human IL-1beta and detection of Canakinumab in samples by a polyclonal anti-human IgG coupled to HRP. In both cases separate standard curves for serum and milk were established. Serum samples and milk samples of unexposed healthy controls were used to determine the lower limit of quantification.
Results: One patient with MWS received canakinumab 150 mg s.c. to treat a worsening of her disease ten days postpartum. She continued to breastfeed her child. The average concentration of canakinumab in milk samples collected on 10 consecutive days was 15.8 ng/ml. The average daily infant dose was 0.002 mg/kg/day. The relative infant dose, which refers infant to maternal exposure on a dose/weight basis, was 0.11%. There was no detectable canakinumab in the serum of the infant.
One patient with MPA received rituximab 500 mg i.v. as a remission maintenance therapy four months postpartum. She continued to breastfeed her child. The average concentration of rituximab in milk samples collected on 4 consecutive days was 3.71 ng/ml. The average daily infant dose was 0.001 mg/kg/day. The relative infant dose was 0.01%. There was no detectable rituximab in the serum of the infant.
Conclusion: Only minimal concentrations of canakinumab and rituximab can be detected in breastmilk. For both bDMARDs, the relative infant dose was below 1% of the maternal dose, which is considered unlikely to be of clinical concern. The lack of detectable levels of canakinumab and rituximab in the infants' sera supports the notion of low oral bioavailability of large monoclonal antibodies. Together, the results are similar to those seen in TNF inhibitors which are regarded to be compatible with breastfeeding, yet more data are needed (1, 2, 3).

HPR Epidemiology and public health (including prevention)

AB1295-HPR **PREGNANCY RISK IN CHILDBEARING AGE WOMEN WITH RHEUMATIC DISEASES**

E. Barriga-Maldonado[1], C. M. Skinner Taylor[1], L. Pérez Barbosa[1], J. D. Ángulo[1], F. Vázquez[1], G. Figueroa-Parra[1], R. Pineda-Sic[1], J. C. Riegatorres[1], D. Á. Galarza-Delgado[1]. [1]*Hospital Universitario Dr. José Eleuterio González, Servicio de Reumatología, Monterrey, Mexico*

Background: Rheumatic diseases (RD) are more frequent in women, affecting them during childbearing age. Medications used to treat can interfere with fertility or increase the risk of miscarriages and congenital abnormalities; Disease control and therapy should be discussed with patients before and during pregnancy, in order to minimize adverse outcome (1). Barriers to adequate communication

and counseling of women regarding reproductive health and family planning still exist among rheumatologists and increases the risk of complications(2).

Objectives: To identify childbearing age women with RD and a high risk of pregnancy.

Methods: A cross-sectional study was performed in the rheumatology clinic of the university hospital "Dr. Jose Eleuterio Gonzalez" in Monterrey, Mexico between October 2019 and January 2020. All non-pregnant childbearing age (18 to 45 years old) women any were included. A self-questionnaire of 10-items was applied. Demographic, data were collected from the electronic medical record. Results are shown in descriptive statistics. Analyses were performed with SPSS 22. A p< 0.05 was considered statistically significant.

Results: 135 women were evaluated, median age was 33 (25-39) years. Patients characteristics are shown in table 1. 115 (85.1%) had initiated sexual activity earlier in life (median age 18 years). Regarding the question, did you have sex last month? 115 answered it, 69 (60%) said they had, 49 (42.6%) used a contraceptive and 20 (28.9%) did not. 135 patients, 68 (50.3%) had a desire for pregnancy, 12 (17.6%) in the next 12 months and 56 (82.3%) in more than one year, of which 37 (66%) were using a family planning method and 19 (34%) were not (Table 2). For the question about receiving contraceptional counselling 112 answered it, 80 (70.4%) say they had. When they were asked if they received family planning and reproductive health counseling by their rheumatologist, just 64 (57.1%) affirmed they did; There was no differences in the use of contraceptive methods among those who received contraceptive counselling and those who did not (p>0.05). Among the 67 (49.6%) patients who did not want to be pregnancy 16 (23.8%) did not use a contraceptive method.

Table 1. Chracteristics

	n=135
Age, *years, median (IQR)*	33 (25-39)
Marital status *n (%)*	
Single	58(42.9)
Unmarried	19 (14.1)
Married	49 (36.3)
Divorced	9 (6.7)
Education *n (%)*	12 (8.9)
None	
Elementary school	17 (12.6)
High school	77 (57.0)
University	28 (20.7)
Diagnosis *n (%)*	
Rheumatoid arthritis	63 (46.7)
Systemic lupus erythematosus	39 (28.9)
Other autoimmune diseases	32 (24.3)
Onset of Sexual activity age, median (IQR)	18 (16-20)
Onset of Sexual activity?, n (%)	
Yes	115 (85.1)

Table 2. Tool questions

	n=135 (%
Did you have sex last month? *(n= 115, %)*	69 (60)
Yes	
Did you use any contraceptive method? *(n=115, %)*	
Yes	49(42.6)
Did you receive family planning and reproductive health counseling by the rheumatologist? *(n= 112, %)*	
Yes	64 (57.1)
Do you want to get pregnant after the next 12 months?	
Yes	56 (41.1)
Do you want to get pregnant in the next 12 months?	
Yes	12 (8.9)
Contraceptional counselling *(n=112, %)*	
Yes	80 (71.4)
Current treatment *(n= 107, %)*	
Pregnancy Risk	65 (60.7)

Conclusion: Using this short questionnaire, we identified that 35 (25.9%) of the patients had a risk of unintended pregnancy and that only 80 (70.4%) received reproductive health counseling from their rheumatologist. It is necessary to design and systematically apply questionnaires capable of detecting and evaluating risks in this population.

AB1296-HPR **PREVALENCE OF COMORBIDITIES IN A COHORT OF PATIENTS IN AN EDUCATIONAL MULTIDISCIPLINARY PROGRAM**

M. Cabrera[1], F. Rodriguez[2], D. Buitrago-Garcia[3], G. Sánchez[3], P. Santos-Moreno[4]. *[1]Biomab - Center for Rheumatoid Arthritis, Data Administration, Bogota, Colombia*; *[2]Biomab - Center for Rheumatoid Arthritis, Patient Education Program, Bogota, Colombia*; *[3]Fundación Universitaria de Ciencias de la Salud, Epidemiology, Bogota, Colombia*; *[4]Biomab - Center for Rheumatoid Arthritis, Rheumatology, Bogota, Colombia*

Background: Rheumatoid arthritis (RA) is a chronic inflammatory and complex disease. Patients with RA face other diseases that might lead to increase

morbidity. In patients with RA it has been stablished a high prevalence of comorbidities and their risk factors (1).

Objectives: The aim of this study was to evaluate the prevalence of comorbidities in Colombian patients with RA enrolled in an educational multidisciplinary program and possible correlation with disease activity

Methods: We performed a cross-sectional study; we included patients with confirmed diagnosis of rheumatoid arthritis in a specialized RA center. We collected sociodemographic data, and markers of disease activity DAS28. We collected data regarding the history of comorbidities such as hypertension, dyslipidemia, osteoporosis, type 2 diabetes mellitus, hypothyroidism, malignancies, among others. We performed a descriptive analysis, variables with a normal distribution were described using mean and standard deviation (SD), and non- normal distributed variables were described using median and interquartile range. Categorical variables were presented as rates. We evaluated the relationship between disease activity and comorbidities.

Results: We included 251 patients; mean age was 59 ± 9.8 years old, with a high proportion of women 93%; median disease duration was 15 years RIQ (8-20); in this study, 145 (65%) of patients were in remission; 35 (11%) had low, 44 (20%) moderate and 10 (4%) high disease activity. Regarding pharmacological therapy, 55% were receiving conventional DMARDs. The prevalence of comorbidities was 85%, the most common were high blood pressure 25% followed by hypothyroidism 12% and diabetes 10%, 0.7% of patients had malignancies such as thyroid cancer or breast cancer, 1.29% of patients had renal comorbidities. Among comorbidities related to RA 30% had osteoporosis and 20% arthrosis. We did not find a statistical association between DAS28 and comorbidities.

Conclusion: As other studies have shown, there is a high prevalence of comorbidities among RA patients, mainly high blood pressure. Due to the above, it is relevant to evaluate the risks factors of patients with RA, especially cardiovascular risks. We consider that a multidisciplinary program represents an opportunity not only to educate patients about healthy life styles and the management of RA, but also other diseases in order to increase the empowering of the health status in these poly pathological patients(2).

AB1297-HPR BONE AND MINERAL METABOLISM IN SPONDYLOARTHRITIS

D. Castro-Corredor[1], M. A. Ramírez Huaranga[2], A. I. Rebollo Giménez[2], M. D. Mínguez Sánchez[2], J. Anino-Fernández[2], I. M. De Lara Simón[2], J. L. Cuadra Díaz[2]. *[1]Hospital General Universitario Ciudad Real, Ciudad Real, Spain*; *[2]Hospital General Universitario Ciudad Real, 13005, Spain*

Background: Spondyloarthritis is the term for a group of inflammatory chronic diseases primarily affecting the axial skeleton, as well as the peripheral joints. Regarding bone metabolism in these patients, several studies have reported higher levels of inflammatory activity (BASDAI, BASMI, ESR and CRP) in patients with osteoporosis compared to those without this disease, although no correlations were found.

Objectives: To describe clinical, serological and biological characteristics, as well as bone and mineral metabolism, according to analytical and densitometric criteria in a patient cohort with spondyloarthritis.

Methods: Observational, descriptive and cross-sectional study. A retrospective review was conducted of a database of patients with spondyloarthritis treated during outpatient visits at the Rheumatology Department of Hospital General Universitario de Ciudad Real between June 2018 and June 2019. Variables are described using measures of frequency and of central tendency and dispersion.

Results: Cohort of 115 patients (64 men and 51 women). Average age 45.97 years (+/- 13.41 SD). Ankylosing spondylitis in 54 patients, psoriatic arthropathy in 24, spondyloarthropathy associated with inflammatory bowel disease in 8, undifferentiated spondyloarthritis in 18 and other types of spondyloarthritis in 11. Regarding treatment, 40.88% of patients received disease-modifying drugs (methotrexate, sulfasalazine, etc.) and 43.4% received biologic drugs (86% anti-TNF alpha, 12% anti-IL-17 and 2% anti-IL-12/23). Moreover, 53.04% had received corticosteroids during some phase of their disease. Vitamin D levels were 23.81 (+/- 10.5 SD) and 77.4% of patients had a vitamin D deficiency/insufficiency. Of the total cohort, 34.78% presented osteopenia and 3.58% osteoporosis (T-Score and Z-Score).

Conclusion: In this study, patients with spondyloarthritis show high percentages of osteopenia and osteoporosis, undiagnosed until this time, along with vitamin D deficiency. This data suggests higher prevalences of these metabolic bone diseases. Osteoporosis prevention is essential due to the risk of developing early fractures resulting from increased bone fragility.

AB1298-HPR RHEUMA-VOR: A PROOF-OF-CONCEPT NETWORK STUDY FOR THE IMPROVEMENT OF RHEUMATOLOGICAL HEALTH CARE THROUGH COORDINATED COOPERATION

M. Dreher[1], R. E. Schmidt[2], T. Witte[2], G. Assmann[3], K. Hoeper[4], K. Triantafyllias[5], J. Zeidler[6], H. Binder[7], A. Schwarting[1,5]. *[1]University Medical Center of the Johannes Gutenberg University Mainz, Division of Rheumatology and Clinical Immunology, Mainz, Germany*; *[2]Hannover Medical School, Department of Immunology and Rheumatology, Hannover, Germany*; *[3]Saarland University Medical Center, Rheumatology, Homburg, Germany*; *[4]Center for Rheumatology Lower Saxony e.V, Hannover, Germany*; *[5]ACURA Center of Rheumatology Rhineland-Palatinate, Bad Kreuznach, Germany*; *[6]Leibniz University Hannover, Center for Health Economics Research Hannover, Hannover, Germany*; *[7]University Medical Center Freiburg, Institute of Medical Biometry and Statistics, Freiburg, Germany*

Background: Rheumatoid arthritis (RA), psoriasis arthritis (PsA) and spondyloarthritis (SpA) are the most common chronic inflammatory rheumatic diseases. For all three diseases, the so-called “window of opportunity” [1,2,4] has been identified as the decisive factor affecting the outcome.

Objectives: The aim of the prospective study is to improve the early diagnosis of RA, PsA and SpA and thus positively impact the quality of care for patients with the support of coordinating centers.

Methods: Primary care providers are given access to screening questionnaires to document potential early cases of RA, PsA, and SpA, based on characteristic symptoms. These are evaluated by multidisciplinary teams at the regional coordinating centers. If they fulfill the criteria for referral, patients get an appointment at a cooperating rheumatology specialist within weeks. If a rheumatic disease is diagnosed, physicians and patients receive questionnaires about sociodemographic, physilogical and psychological parameters.

In order to increase the quality of referrals, a 15-minute rheumatological consultation at the ACURA Rheumatology Center was implemented for all patients from Rhineland-Palatinate whose suspected diagnosis was confirmed by the coordination centre. In course of this, the Rheuma-VOR Screening-App will also be developed and optimized. The cooperating partners and additional information are already published [5].

Results: Preliminary data (31 Dec 2019) are presented. In Rhineland-Palatinate, Saarland and Lower Saxony, 4942 suspected diagnoses of 1526 different referring physicians have now been reported. A total of 2578 patients were referred by the three coordination centres to one of the 49 participating rheumatological specialists. 1004 patients were diagnosed with one of the three diseases. About 306 patients have already taken the follow-up appointment after one year.

In course of a screening consultation 736 patients have been screened to date. The patients have to wait in average about 42 days from the suspected diagnosis to the rejected or confirmed rheumatological diagnosis.

Conclusion: Although the average waiting time for all three diseases is currently almost twice as long as the 23.9 days in the Rhineland-Palatinate predecessor project ADAPTHERA which just focuses on RA, the current results are very positive compared to the national average [3]. The aim is to further increase the screening quality and screening numbers, especially in the 1-year follow-up.

Current data will be presented at the conference.

AB1299-HPR THE RHEUMA-VOR APP: OPTIMIZING THE EARLY DIAGNOSIS OF RHEUMATIC DISEASES

M. Dreher[1], L. Wojnowski[2], D. Tibyampansha[2], A. Hilt[3], A. Schwarting[1,3].
[1]*University Medical Center of the Johannes Gutenberg University Mainz, Division of Rheumatology and Clinical Immunology, Mainz, Germany*;
[2]*University Medical Center of the Johannes Gutenberg University Mainz, Department of Pharmacology, Mainz, Germany*; [3]*ACURA Center of Rheumatology Rhineland-Palatinate, Bad Kreuznach, Germany*

Background: The proof-of-concept network study "Rheuma-VOR" aims to improve the quality of rheumatological care through coordinated cooperation. In particular, rheumatic diseases should be diagnosed as early as possible and treated quickly in a targeted manner [3]. Smartphone apps have a potential to improve the management of chronic diseases. For example, they can be used to provide health information, or to offer self-monitoring and self-screening options [1, 2].

Objectives: The Rheuma-VOR Screening-App study examines whether a smartphone-based app can increase the detection rate of the three most common chronic inflammatory rheumatic diseases: rheumatoid arthritis, psoriatic arthritis and spondylarthritis.

Methods: Based on the multi-stage Delphi Procedure, a minimal list of questions for detection and differentiation between the three diseases was defined. The app for iOS and Android is in use since October 2018 during the screening consultation at the Division of Rheumatology and Clinical Immunology and at the ACURA Center of Rheumatology Rhineland-Palatinate. An additional validation will be performend with a non-preselected cohort based on the data of the Rheuma Bus Tour 2019.

Results: The Delphi Procedure identified 17 questions, including four laboratory parameters. They have been deployed in German as a smartphone app. The questions are read to the patient and can be answered with "YES", "NO", or "I DO NOT KNOW". Answering the questions takes approximately four minutes. The suspected diagnoses are based on a cumulative score. Some diagnoses are excluded or confirmed already after a few questions.

To date (31 Dec 2019), the app has been used on 466 patients. The sensitivity is 0.91, while the specificity is 0.25. The positive predictive value and the negative predictive values are 0.60 and 0.32, respectively. The false positive value is 0.33 and the false negative value 0.05.

Conclusion: The Rheuma-VOR App helps doctors and patients to invalidate or to confirm the suspicion of a possible rheumatic disease. Data from the cohort is currently analyzed to increase the screen's specificity. The additional validation, based on a non-preselected cohort collected during the Rheuma Bus Tour 2019, is in progress. A final validation concept is currently being developed.

In 2020, a section with the most important information about the aforementioned three diseases will be added. The section will include definition, etiology, prognosis, symptoms, therapeutic principles, medication and case studies.

Current data will be presented at the conference

AB1300-HPR MALNUTRITION SCREENING AND ASSESSMENT TOOLS IN RHEUMATIC DISEASES

C. M. Gamboa-Alonso[1], J. D. Ángulo[1], R. E. Díaz-García[1], G. Figueroa-Parra[1], D. Á. Galarza-Delgado[1], J. C. Riegatorres[1]. [1]*Hospital Universitario José Eleuterio González., Monterrey, Mexico*

Background: Inflammatory disorders have been associated with an increased risk of malnutrition, defined as an abnormal physiologic condition caused by an insufficient, unbalanced or excessive intake of nutrients due to exacerbated metabolic states.[1]

Mini Nutritional Assessment (MNA) and Nutritional Risk Screening Tool 2002 (NRS-2002) have been used to evaluate nutritional status in patients with rheumatic diseases.

Objectives: Compare MNA and NRS-2002 as tools for nutritional screening in rheumatic patients.

Methods: 152 patients with rheumatic diseases were evaluated in a Rheumatology center of México. Anthropometrical measurements were performed using Bioelectrical Impedance Analysis (BIA) TANITA. MNA and NRS-2002 were applied at the same date.

MNA is comprised of a dietary questionnaire, subjective and objective global assessment and anthropometrical measurements, classified as adequate (MNA 24-30), risk for malnutrition (MNA 17–23.5) and malnutrition (MNA<17).

NRS-2002 consists of nutritional and severity disease score and an age adjustment for patients >70 years (+1); classified as normal (0-3) and risk of malnutrition/established malnutrition (3 or more).

For statistical analysis the SPSS v24 was used. A $p < 0.05$ was considered statistically significant.

Results: A total of 152 patients with different rheumatic diseases were included, Table 1. The results according to each tool are represented in **Graphic 1.** A significant difference was found by the Chi-Square-test when comparing both tools, ($p<0.004$).

Table 1. Socio-demographic characteristics of rheumatic patients

DISEASES, n (%)	
Rheumatoid Arthritis	70 (46.1)
Systemic Lupus Erythematosus	19 (12.5)
Ostearthrosis	18 (11.8)
Sjögren´s Syndrome	5 (3.3)
Fibromyalgia	4 (2.6)
Ankylosing Spondylitis	2 (1.3)
Systemic Sclerosis	6 (3.9)
Others	27 (17.8)
SOCIO-DEMOGRAPHICS	
Age, mean years (SD)	51.98 (13.56)
BMI, mean (SD)	28.14 (5.8)
Brachial Circumference, cm, (SD)	32.57 (4.19)
Calf Circumference, cm, (SD)	37.08 (4.17)

A subanalysis in 70 Rheumatoid Arthritis patients was done with a mean age of 50.94 years (SD±12.11) and a mean BMI 28.53 kg/m2 (SD 5.48). The results according to each tool are represented in Table 2. When NRS-2002 was reclassified in 3 parameters (normal <2, risk of malnutrition 2 and malnutrition 3 or more), a significant difference persisted (p. 05) with a low correlation (.43).

Table 2. Descriptive data of MNA and NRS-2002 in rheumatic diseases.

	NUTRITIONAL SCREENING TOOLS				
	MNA	**NRS-2002**	**NRS-2002***	**Rho**	**p**
All Rheumatic Diseases					
Total Score, *n(SD)*	24.31 (3.48)	___	___	.23	.004
Malnutrition, *n(%)*	4 (2.6)	5 (3.3)	5 (3.3)		
Risk, *n(%)*	55 (36.2)	147 (96.7)	41(27)		
Normal, *n(%)*	93 (61.2)		106 (69.7)		
Rheumatoid Arthritis					
Total Score, *n(SD)*	24.43 (3.23)	___	___	.43	.05
Malnutrition, *n(%)*	1 (1.4)	2 (2.9)	2 (2.9)		
Risk, *n(%)*	22 (31.4)	68 (97.1)	15 (21.4)		
Normal, *n(%)*	47 (67.1)		53 (75.7)		

Conclusion: MNA was a more sensible tool for detecting risk of malnutrition when compared to NRS-2002. Screening tools play an important role at nutritional evaluation and should be complemented with objective methods such as BIA.[1] Rheumatologists must be aware that nutritional disorders affect the state of rheumatic diseases; and selecting an appropriate tool to detect malnutrition is of vital importance.

AB1301-HPR COMORBIDITIES AND FACTORS INFLUENCING RECURRENT GOUT ATTACK IN PATIENTS WITH GOUT: A CROSS-SECTIONAL STUDY

Y. Jiang[1], Z. Liao[1], Y. Huang[1], J. Liang[2], Y. Xie[1], J. Wu[1], J. Gu[1]. [1]*The Third Affiliated Hospital of Sun Yat-Sen University, Guangzhou, China*; [2]*Huadu Affiliated Hospital of Southern Medical University, People's Hospital of Huadu District, Guangzhou, China*

Background: Gout attack is characterized by painful arthritis, loss of function and reduced quality of life. Frequent gout attacks can exert negative an influence on gout management [1].

Objectives: The objective was to identify the comorbidities of gout, to compare gender difference and to identify independent factors of multiple gout attacks.

Methods: A cross-sectional study was performed to collect demographic, clinical variables, self-reported comorbidities, and relevant testing. Group comparison and correlation of serum uric acid (sUA) levels with other variables was performed. Univariate and multivariate logistic regression was used to detect independent risk factors of sUA.

Results: 653 gout patients were enrolled, including 553 (84.7%) males. The mean age was 48.3±15.8 years old, with a disease duration of 8.0±6.4 years. 170 (26.0%) patients had hypertension, and 57 (8.7%) had hyperlipidemia. Elevated total cholesterol (TC) was observed in 173 (26.5%) cases. 42 (37.1%) cases presented with increased triglycerides (TG) and 270 (41.3%) had increased low-density lipoprotein (LDL-C). Abnormalities including nephrolithiasis (29.4%), hydronephrosis (3.2%), and gallstones (11.9%) were detected in the patients who underwent ultrasound examination. Although female patients had a longer disease duration, they had lower levels of sUA, creatine and C-reactive protein (CRP). A positive correlation with sUA was found in TG and CRP (P<0.05) in female patients, which was not observed in males. Only gout duration (OR=1.406, P <0.001), sUA (OR=1.006, P <0.001) and LDL-C (OR=0.530, P =0.006) were independent factors of gout attack (>20 times).

Conclusion: Comorbidity screening involving dyslipidemia is often neglected in gout patients. Gout duration and sUA level are risk factors of multiple gout attacks.

AB1302-HPR ASSOCIATIONS OF SLEEP ON GOUT PREVALENCE AND SERUM URIC ACID CONCENTRATIONS

P. Kachur[1], S. Tadepalli[2], C. Pramil[2]. [1]*Ochsner Medical Center, New Orleans, United States of America*; [2]*Ocean Medical Center, Brick, United States of America*

Background: Sleep deprivation and sleep inconsistency have been associated with modulation of the immune and inflammatory response systems with effects that include higher risk for psychosis, cardiovascular disease, and increased susceptibility to infection. One hypothesized mechanism to explain these findings is an association with pro-inflammatory states.

Objectives: In a first-of-its kind study, we examined associations between sleep quantity and gout using the largest public US dataset available; the National Health and Nutrition Examination Survey (NHANES).

Methods: NHANES data from 2009 to 2014 was selected based on questionnaire responses and laboratory studies. The resulting data set was analyzed for serum uric acid (SUA) levels (cut-off >6.0 mg/dL in females and >7.0 mg/dL in males), and gout risk factors. Analysis of variance, means, proportions, as well as univariate and multiple logistic regression models were used to evaluate the associations between sleep quantity, SUA and gout.

Results: 10,410 survey participants from 2003 to 2014 were included in the study. A total of 280 (2.7%) had gout. Gout prevalence ranged between 4.0% and 4.7% between high, normal, and low sleep groups. Multivariate analyses showed a significant association between extremely low sleep levels (OR = 0.53 and CI = 0.34 to 0.83), and gout, which was also seen with SUA level association (OR = 0.41 and CI = 0.32 to 0.52). However, in the broader sense, lower than normal (<7 hours) and higher than normal (>9 hours) levels of sleep had no significant associations with either gout prevalence or SUA, likely due to a non-linear relationship of SUA to sleep levels.

Conclusion: Despite numerous adverse effects found with low sleep levels, our study does not show a strong association between sleep quantity and gout prevalence or SUA levels.

AB1303-HPR TIME UNTIL DIAGNOSIS IN RHEUMATOLOGICAL PRACTICE: RESULTS FROM A CROSS-SECTIONAL MIDDLE-EUROPEAN COHORT COMPARED TO DATA FROM A SYSTEMATIC LITERATURE REVIEW

R. Mc-Cutchan[1], S. Maier[1], V. Winkler[1], B. Gruber[1], M. Schirmer[1]on behalf of Rheumatology working group of diploma students, Innsbruck. [1]*Medizinische Universität Innsbruck, Innsbruck, Austria*

Background: The time from first symptom to diagnosis (= diagnostic delay) is considered as key factor for better outcome in many chronic inflammatory rheumatic diseases, especially for rheumatoid arthritis (RA) and vasculitides like giant cell arteritis (GCA). A longer diagnostic delay may cause pain, reduced functionality, reduced life-quality and increased morbidity, as well as structural damages of the organs linked with higher mortality. This retrospective study assessed the diagnostic delay in consecutive Middle-European outpatients and compared results with those of a systematic literature review (SLR).
Objectives: To compare disease-specific diagnostic delays of consecutive rheumatic patients with international data from a systematic literature review.
Methods: Charts of a single-centre cohort with consecutively recruited patients were retrospectively reviewed for patients' and diseases' characteristics at a Middle-European university outpatient clinic for rheumatology. A SLR was performed according to PRISMA guidelines.
Results: The average mean ± SD time from first symptom to established diagnosis was 7.9 ± 11.7 (0.02-56.7) years. Spondyloarthritis patients showed the longest diagnostic delay with 13.1 ± 14.2 (0.1-56.7) years, whereas polymyalgia rheumatica-patients had the shortest diagnostic delay with 1.5 ± 0.4 (0.3-18.0) months. In the SLR, most data for diagnostic delays are comparable to the Innsbruck cohort, but the diagnostic delay for psoriatic arthritis in Innsbruck is longer than in the Danish DANBIO registry (p<0.001). Independent risk factors for prolonged diagnostic delays could not be identified.
Conclusion: For this Middle-European area, initiatives are justified especially to shorten diagnostic delays of SpA and PsA.

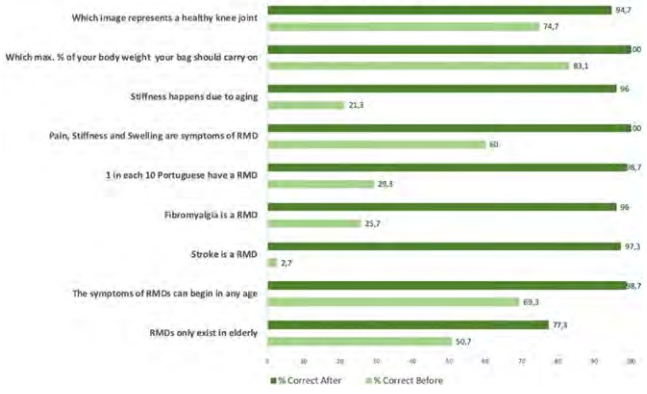
AB1304-HPR KNOWLEDGE OF HIGH SCHOOL STUDENTS ABOUT RHEUMATIC DISEASES: EFFECT OF AN EDUCATIONAL SESSION JOINTLY PROVIDED BY PORTUGUESE EULAR ASSOCIATIONS

G. Pimentel[1], A. Marques[2,3], R. Ferreira[2,3], E. Mateus[4], A. Pais[5]. [1]*CHUC, Internal Medicine, Coimbra, Portugal*; [2]*CHUC, Rheumatology, Coimbra, Portugal*; [3]*UICISA:E, ESEnfc, Coimbra, Portugal*; [4]*Portuguese League Against Rheumatic Diseases, Lisboa, Portugal*; [5]*Portuguese Association of Childhood with Arthritis and Rheumatism, Lisboa, Portugal*

Background: International studies have shown that the awareness and knowledge of the general population about rheumatic and musculoskeletal diseases (RMDs) is poor. This is even lower in the young population, which are also affected by these disease but do not have as much awareness campaigns as adult community. Their professors and primary health care professionals may also play here also a key role, promoting early detection of signs and interpretations of symptoms, thus avoiding late health care referrals and diagnosis. (Vlieland, 2016).
Objectives: To assess the knowledge of high school Portuguese students about the RMDs and raise awareness for RMDs in young people, their professors, vigilants, and primary care nurses, within the school environment.
Methods: A 1-hour educational session about RMDs was planned (with the inputs from members of the Portuguese EULAR Associations) and performed during school activities. The educational session started with a knowledge questionnaire about RMDs in a paper sheet (9 questions; Graph 1), repeated in the end. An interactive session, using slides, interactive questions (Sli.do®), and practical demonstrations to simulate RMD symptoms (e.g. stiffness and functional limitations) was then lead by a rheumatology nurse, with the testimony from a young patient representative. A primary care nurse assisted in order to be engaged and promote future sessions ("autonomously"). Change in knowledge was assessed with Wilcoxon-test and awareness was documented with "word clouds" (using Sli.do®).
Results: A total of 75 students participated in four sessions (mode=16 years). Half of students (52%) had never heard about RMDs. Knowledge increased significantly in all questions (p<0.001; Graph 1). Figures 1 and 2 document the most common words representing what defines a RMD and what are the main symptoms, respectively.

Graph 1. Change in the percentage of correct answers before and after na educational session (n=75) (all p<0.001)



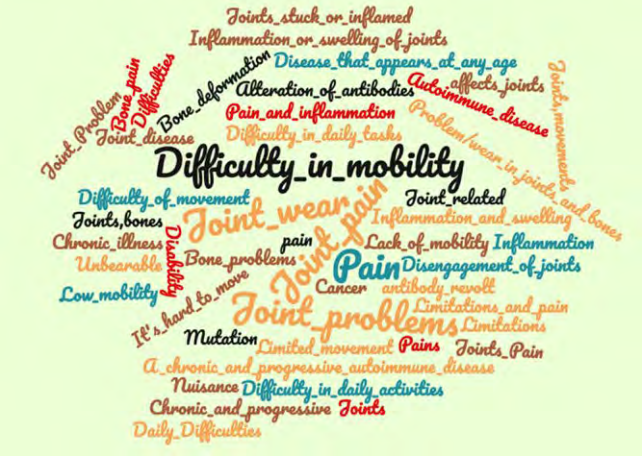


Figure 1. "One to two words" to define "Rheumatic diseases" by college students (n=75) after an educational session

Figure 2. Symptoms that can indiciate a rheumatic disease, according to college students (n=75) after an educational session

Conclusion: Our results confirm that awareness and knowledge about RMDs are very low high school students. The single and educational session was very well received by all students, and the the knowledge increased. Post-educational feedback was that students especially liked the testimony of a peer. Other sessions are taking place in primary schools.

AB1305-HPR

IS BETTER AND SAFER TOFACITINIB AS A FIRST LINE OF TREATMENT IN PATIENTS WITH RHEUMATOID ARTHRITIS? – A COHORT STUDY

O. Valencia[1], M. Cabrera[1], F. Rodriguez[2], P. Santos-Moreno[3]. *[1]Biomab - Center for Rheumatoid Arthritis, Data Administration, Bogota, Colombia*; *[2]Biomab - Center for Rheumatoid Arthritis, Patients Education Program, Bogota, Colombia*; *[3]Biomab - Center for Rheumatoid Arthritis, Rheumatology, Bogota, Colombia*

Background: Tofacitinib is the first oral Janus Kinasa inhibitor approved for the treatment of rheumatoid arthritis (RA); and although it is approved both after conventional treatment and after biological therapy, it is not well known its real-life effectiveness in both cases and if it is preferable to use it after cDMARDs or biologics.

Objectives: We compare the effectiveness and safety of Tofacitinib in patients with RA analyzing if better and safer Tofacitinib after cDMARDs or biologics.

Methods: A retrospective analysis of a real-world cohort of patients with RA, who were treated with Tofacitinib in last 3 years, as first line of treatment (T1) after failure with cDMARDS and second line of treatment after biologic drug failure (T2). The therapy was considered effective with the change from moderate-high disease activity to low disease activity or remission measured by DAS28, in those who met criteria of high adherence, without change or addition of other conventional DMARDs, without new dose or increase of dose of oral glucocorticoids. A logistic model of regression was performed to evaluate de differences between T1 and T2, using as covariates sex, age, comorbidities, time of disease evolution, adverse events and other causes of discontinuation. Medication survival time and the main causes of suspension were measured. Mixed model regression and least-squared means were used to estimate the baseline changes and a Kaplan-Meyer survival analysis to estimate time to remission and drug survival.

Results: 105 patients with RA were included (median age: 56.1 ± 11.7 years; 80.9% female, median disease duration 11.48 ± 10.1 years); 43% (45/105) of patients with positive rheumatoid factor and 73% (77/105) positive anti-citrulline antibodies. Regarding treatment 51% (54/105) used Tofacitinib as 1T, after failure to cDMARDs; on the other hand, Tofacitinib was used as 2T, after failure to biologics in 49% (51/105) of patients. DAS28 levels were reduced at 8, 16 and 24 weeks with statistical difference (p value 0.004, <0.0001, and <0.001, respectively). HAQ-DI also reported reduction but without statistical difference. The use of Tofacitinib was more effective after failure to cDMARDs (p value 0.014) and patients with more than 3 years of disease (p value 0.04), a statistically better response. Also, corticoids use, positive RF, extended release tablet of tofacitinib reported better changes of DAS28 but without statistical significance. Patients with high disease activity treated with Tofacitinib 1T decreased from 30% at baseline to 19% at the last follow-up; patients in 2T way were in moderate activity of the disease in 57% at baseline and went to 37% in the last follow-up. There was an increase in patients who achieved remission in both groups, but higher in 1T where they went from 9% to 41%, while in 2T they went from 22% to 33% ($p < 0.05$). The survival rate of the medication was 1.7 years in 1T and 2.1 in 2T; in terms of time to remission, the use of Tofacitinib monotherapy presented statistical difference (p value <0.001). The main cause of suspension of treatment was therapeutic failure 12% (13/105), 9% in 1T (5/54) and 16% (8/51) in 2T (p <0.005). 6% of patients (6/105) presented suspension due to the occurrence of adverse events, 4% (2/54) in 1T and 8% (4/51) in 2T (p <0.005).

Conclusion: In patients with RA, the use of Tofacitinib as the first line of treatment (after failure to cDMARDs) is better in effectiveness and safer in comparison with its use as a second line of treatment (after biologics), with significant differences in the rates of therapeutic failure and occurrence of adverse events/reactions. On the other hand, concomitant corticoids use, positive RF, extended release tablet of Tofacitinib seem to increase the effectiveness of Tofacitinib in terms of DAS28 and HAQ-DI.

HPR Interventions (educational, physical, social and psychological)

AB1306-HPR

THE EFFECTS OF CLINICAL PILATES EXERCISES IN PATIENTS WITH RHEUMATOID ARTHRITIS

S. Baglan Yentur[1], N. Atas[2], M. A. Ozturk[2], D. Oskay[2]. *[1]Fırat University, Elazığ, Turkey*; *[2]Gazi University, Ankara, Turkey*

Background: Rheumatoid Arthritis (RA) is a rheumatic disease that may coexist many symptoms clinically. These clinical symptoms progress in a vicious cycle in many patients. Physical activity and exercise are known to improve many symptoms in RA patients.

Objectives: This study was designed to investigate the effects of clinical pilates exercises on fatigue, depression, aerobic capacity, pain, sleep quality and quality of life.

Methods: Thirty voluntary RA patients were included in this study. Patients were separated into three groups equally and each group was applied treatment for eight weeks. Clinical pilates exercises were practiced to the first group, aerobic exercises were practiced to the second group and combined training which was a combination of pilates exercises and aerobic exercises was performed to the third group. Fatigue, depression, aerobic capacity, pain, sleep quality and quality of life were evaluated by Fatigue Severity Scale (FSS), Beck Depression Inventory (BDI), Six minute walk test (6MWT), Short- Form McGill Pain Questionnaire (MPQ), Pittsburg Sleep Quality Index (PSQI) and Rheumatoid Arthritis Quality of Life (RAQoL), respectively.

Results: According to our results, statistically significant improvements were found for clinical pilates exercises on fatigue, depression, aerobic capacity and quality of life ($p<0.05$). Improvements in all parameters except from pain were concluded for aerobic exercises and combined training ($p<0.05$). Also, there was no statistically significant difference among the treatment groups in assessments ($p>0.05$).

Conclusion: Pilates exercises were found effective and safe for RA patients. Clinical pilates training may be as effective as aerobic exercises in patients with RA according to our study. Therefore, addition of clinical pilates exercises to the routine treatment of RA may enhance the success of rehabilitation.

AB1307-HPR INVESTIGATION OF THE EFFECTIVENESS OF TAI CHI EXERCISE PROGRAM ON CARDIOPULMONARY FUNCTIONS AND QUALITY OF LIFE IN PATIENTS WITH SYSTEMIC SCLEROSIS

S. Y. Cetin[1], B. Basakci Calik[2], A. Ayan[3]. [1]*Akdeniz University, Department of Physiotherapy and Rehabilitation, Antalya, Turkey*; [2]*Pamukkale University, Physiotherapy, Denizli, Turkey*; [3]*Antalya Training and Research Hospital, Rheumatology, Antalya, Turkey*

Background: Systemic sclerosis (SSc) is an autoimmune disease that not only affects the skin but also causes symptoms that involve important internal organs such as joints, muscles, and heart and lungs. Due to all these multiple system involvements, the quality of life of individuals with scleroderma decreases. Tai Chi Chuan is a combination of physical exercise and relaxation techniques, and it is a traditional Chinese exercise method used to improve mental and physical health of people. There are many studies showing that Tai Chi improves the body's aerobic capacity and psychological well-being. In the literature, Tai Chi has been shown to reduce pain, improve physical function, improve healing effects on depression and quality of life, especially, in the elderly, individuals with musculoskeletal diseases such as rheumatoid arthritis and osteoarthritis, and improve cardiac vascular risk factors such as hypertension and diabetes.

Objectives: The aim of the study is to examine the effectiveness of Tai Chi on cardiopulmonary functions and quality of life in patients with SSc.

Methods: 28 SSc patients (25 females, 3 males) with an average age of 53.00 ± 10.00 were included in the study. For training, patients were divided into two groups by block randomization method. Group 1 received 60 minutes of Tai Chi exercise program and Group 2 received 60 minutes of home exercise for 2 days a week for 8 weeks. 6-min walk test (6MWT) and St. George Respiratory Questionnaire was used to evaluate the cardiopulmonary functions, Short form 36 (SF-36) was used to evaluate the quality of life. All evaluations were performed at baseline and at the end of the 8th week

Results: When the groups were compared before training, there was no significant difference (p> 0.05). In post-training comparisons, there was a significant difference in all parameters in Tai Chi group (p: 0.001-0.045); there was a significant difference in the physical function sub-parameter of SF-36 and 6MWT in the home exercise group (p: 0.045, p: 0.038, respectively). Comparing the post-training groups, Tai Chi group was found to be superior in terms of all parameters compared to the home exercise group (p: 0.00-0.04). No side effects were observed during the exercises.

Conclusion: As a result of our study; Tai Chi has a possitive effect on cardiopulmonery function and quality of life in patients with SS. Tai Chi should be included in rehabilitation programs as a safe alternative type of exercise to improve cardiopulmonery function and quality of life in patients with SSc.

AB1308-HPR DEVELOPMENT OF AN E-LEARNING PATIENT EDUCATION PROGRAM TARGETING PATIENTS WITH RHEUMATOID ARTHRITIS: FROM CONTENT TO DESIGN

L. Raunsbæk Knudsen[1], K. Lomborg[2,3], A. De Thurah[1,3]. [1]*Aarhus University Hospital, Department of Rheumatology, Aarhus N, Denmark*; [2]*Steno Diabetes Center Copenhagen, Copenhagen, Denmark*; [3]*Aarhus University, Department of Clinical Medicine, Aarhus, Denmark*

Background: Patient education (PE), with the aim of supporting patients to self-manage their disease is important in the treatment and care of patients with rheumatoid arthritis (RA) (1). Today, there is a shift in the organization of healthcare systems due to a demographic change towards ageing populations and an increasing use of technology. Advancements in web-technology can offer alternative ways to provide PE – e.g. through an e-learning platform. However, *E-Learning development must be based on the needs of the learners and on existing evidence on both education and content.*

Objectives: To develop an e-learning platform targeting newly diagnosed patients with RA.

Methods: Focus group interviews with patients, rheumatologists and nurses, with the aim of exploring informational and educational needs related to RA and how this may be communicated in an e-learning program, were conducted. We used a short interview guide to ensure the focus of the interviews, however, strived for a less structured start of the interview to promote a free discussion and later a more structured discussion of specific questions. Pictures, illustrating possible topics in PE within RA and ways to communicate, were also applied. The transcribed interviews were analyzed using thematic analysis (2).

The theoretical framework in the development and design drew on the cognitive theory of multimedia learning (3) and entertainment education (4).

Results: Four themes, covering experiences and needs emerged in the analysis of the focus-group interviews; '*Knowledge of RA, the disease course and prognosis*','*Medical treatment*','*A new life situation*' and '*Daily living with RA*'.

Subsequently, the program was developed through an iterative process between the project group, patient representatives, a communication consultant, graphic designers and an e-learning company.

The program was divided into three learning modules covering knowledge of RA, complications, medical treatment, examinations and daily living with RA, e.g. coping with emotions, pain, fatigue, work, education, physical activity etc. It offers

a combination of e.g. animations, videos with personal patient stories, podcasts, written text, spoken words and interactive quizzes.

Conclusion: The e-learning program is developed and ready for feasibility testing. Subsequently, the effectiveness of the program will be tested in a RCT study among approximately 250 patients.

AB1309-HPR EFFICACY OF ADDING CAFFEINE TO THE TREATMENT REGIMEN IN REDUCING METHOTREXATE INTOLERANCE IN PATIENTS WITH RHEUMATOID ARTHRITIS: A RANDOMIZED CONTROLLED STUDY

A. Fehr[1], F. El Noby[2], N. Fathi[3], R. Lotfy[2]. [1]*Faculty of Medicine, Helwan University, Rheumatology & Physical Medicine Department, Helwan, Egypt*; [2]*Faculty of Medicine, Aswan University, Rheumatology Department, Aswan, Egypt*; [3]*Assuit Faculty of Medicine, Assuit, Egypt*

Background: Rheumatoid arthritis is one of common form of chronic inflammatory arthritis. Methotrexate has remained anchor treatment because of its potent efficacy[1]. Intolerance to Methotrexate is a common cause of non-compliance[2&3].

Objectives: To investigate the effect of adding caffeine orally as Methylxanthines (Caffeine), act as adenosine receptor antagonists[4] to reduce symptoms of moderate to severe methotrexate intolerance in patients with Rheumatoid Arthritis[5].

Methods: A prospective, randomized controlled study conducted at Aswan University Hospital, Egypt from Jan 2018 till may 2019. Sixty patients with Rheumatoid arthritis who have had experienced moderate to severe methotrexate intolerance was enrolled in the study. The methotrexate intolerance severity score (MISS)[6]was evaluated at base line before initiation of study then at the next three months consecutively. Patients were randomly assigned by closed envelope method into 2 groups each containing 30 patients: **Group (A)**; 30 patients was prescribed caffeine (coffee or dark chocolate) as an antidote to methotrexate intolerance[7]. **Group (B)**; 30 matched patients acted as control group that included who will continue methotrexate regimen without addition of any extra caffeine.

Results: Twenty four patients (80%) at time three follow up visit showed full improvement of symptoms of methotrexate-intolerance compared to ten patients (33.3%) at 2nd month follow up visit and seven patients (23%) at 1st month follow up visit with statistically significant difference all over the study period (P=0.005). half of study group patients discontinued anti-emetic and other drugs while none in control group did.

Conclusion: Adding caffeine to management regimen can reduce the symptoms of severe methotrexate-intolerance in Rheumatoid Arthritis patients.

AB1310-HPR EFFECTS OF INSTRUMENT-ASSISTED SOFT TISSUE MOBILIZATION ON FROZEN SHOULDER: A RANDOMIZED CONTROLLED TRIAL

E. Kaya Mutlu[1], T. Birinci[2], S. Kılıc[3]. [1]*Istanbul University-Cerrahpasa, Department of Physiotherapy and Rehabilitation, Istanbul, Turkey*; [2]*Istanbul Medeniyet University, Department of Physiotherapy and Rehabilitation, Istanbul, Turkey*; [3]*Istanbul Aydın University, Institute of Health Sciences, Istanbul, Turkey*

Background: Frozen shoulder has a greater incidence, more severe course, and resistance to treatment in patients. Management is based on the underlying cause of pain and stiffness. Joint mobilization has been reported to improve joint range of motion in frozen shoulder. However, there is no information regarding the effect of instrument-assisted soft tissue mobilization (IASTM) in frozen shoulder. We proposed that there would be no significant difference between the two manual physical therapy techniques with relatively similar treatment effects in the frozen shoulder.

Objectives: The aim of this randomized controlled study was to compare the effectiveness of IASTM and joint mobilization in the treatment of patients with frozen shoulder.

Methods: Thirty patients with phase II frozen shoulder (mean age 50,9 years, age range 39–65 years) were randomly assigned to one of the two treatment groups: Group I received joint mobilization combined with manual stretching exercise and Group II received IASTM with manual stretching exercise (two days per week for six weeks) (Figure 1). The pain level was evaluated with a visual analogue scale (VAS) and the active range of motion (ROM) was measured with a universal goniometer. The Disabilities of the Arm, Shoulder and Hand score and the Constant-Murley score were used for functional assessment. The assessments were performed at baseline and after the 6-week intervention.

Figure 1. Instrument-Assisted Soft Tissue Mobilization

Results: Both groups had a significant decrease in pain according to VAS and a significant increase in ROM and function level (p<0.05). After the 6-week intervention, improvement of shoulder abduction ROM in Group I was found significantly higher than Group II (p=0.01), on the other hand, Constant-Murley score in Group II was found significantly higher compared to Group I (p=0,001).

Conclusion: Our results supported the hypothesis that either joint mobilization or IASTM, performed in addition to stretching exercise, provided similar improvements in pain levels in patients with the frozen shoulder.

AB1311-HPR

RHEUMATIC AND MUSCULOSKELETAL DISEASES MANAGEMENT TOOL HELPS TO IMPROVE TREAT-TO-TARGET THERAPY AND PATIENTS' ADHERENCE TO TREATMENT

P. Wu[1], W. Li[1], H. Zeng[2], F. Lian[2]. [1]*The First Affiliated Hospital of Sun Yat-Sen University, Dept. of Orthopedics, Guangzhou, China*; [2]*The First Affiliated Hospital of Sun Yat-Sen University, Rheumatology, Guangzhou, China*

Background: Many of the rheumatic and musculoskeletal diseases (RMD) are long term, painful, and function affecting, which takes both the doctors and patients a lot of time and effort. The number of Rheumatologists are not sufficient for the huge population of RMD patients in China. The doctor patient ratio is as low as 1:1000. Relatively inadequate medical resources, traffic inconvenience in rural area, and patients' insufficient understandings of the RMD may cause delayed medical intervention and poor prognosis. Effective RMD patient management tools which provide disease monitoring and enough doctor-patient communication is essential to improve the patients' adherence to treatment. We designed an RMD management app according to the social, cultural and economic situation of Chinese patients, which helps to facilitate shared decision making and relieve the pressure of insufficient medical resources.

Objectives: We aim to investigate the effect of RMD patient management app on treat-to-target therapy and patients' adherence and satisfaction to treatment.

Methods: An observational survey was administrated using a RMD patient management app. The app was designed and improved by Rheumatologist, orthopedics, nurses, patients, and app technical experts. Patients were offered with a questionnaire in regard to satisfaction with the app and their attitudes about the disease. General therapeutic principles, rehabilitation exercise videos and follow-up information were distributed through the app. Warning signals were sent whenever there was a flag sign of exacerbation. The demographic and clinical data, social and economic status, and drug retention rates of the patients were documented. The survey was designed by clinical experts from relevant departments and developed by both doctors and patients.

Results: All patients were supervised by the rheumatologist and orthopedist when using the app. In all the patients included, there were cases of rheumatoid arthritis (35.3%), osteoarthritis (32.4%), ankylosing spondylitis (26.5%), and other chronic arthritis (5.8%). The mean age 38.5±15.8 years old, with 52.9% male and 47.1% female. Most of the patients (85.3%) believed that the app was helpful. Young patients were more likely to respond to the survey than older patients. Some patients (79.4%) had increased compliance because the app offered more chances to communicate with the doctors, which increase their understanding and confidence about the disease. Three patients received flag signs of exacerbation much earlier than they could get to the hospital. From the feedback of the patients, we realized that the patient would like to have more information to keep them from stepping on the trap of false advertisement for therapy (which is very commonly seen in China).

Conclusion: RMD patient need to manage disease activity, daily function and mental state. Insufficient medical resources and patients' knowledge about the disease may lead to poor adherence and prognosis. RMD patient management tool on app was a feasible and cost-effective approach for data collection and patient education. The app increased treat-to-target therapy and patients' adherence to treatment.

A COMPARISON OF THE EFFECTIVENESS OF TWO DIFFERENT KINESIO TAPE APPLICATIONS ON PAIN, FATIGUE AND HEALTH STATUS IN WOMEN WITH FIBROMYALGIA

S. Toprak Celenay[1], B. Anaforoglu Kulunkoglu[1], O. Mete[1]. [1]*Department of Physiotherapy and Rehabilitation, Health Sciences Faculty, Ankara Yildirim Beyazit University, Ankara, Turkey*

Background: Fibromyalgia (FM) is a syndrome characterized mainly by chronic widespread pain, fatigue and a decrease in health status. Kinesio tape (KT), one of complementary approaches, has favorable effects on clinic findings in FM, but studies investigating which types of the KT applications are more effective in FM are scarce.

Objectives: This study aimed to compare the effectiveness of fascial correction and FanCut KT applications on pain, fatigue and health status in women with FM.

Methods: A total of 27 women with FM were included, allocated into fascial correction (Group 1) (n:14, age: 41.50 (30.25) years, body mass index (BMI): 24.85 (5.28) kg/m^2) and FanCut techniques (Group 2) (n:13, age: 45.00 (21.00) years, BMI: 25.60 (4.55) kg/m^2) groups. The fascial correction technique performed with approximately 25% to 50% of tension and oscillated in longitudinal direction on overall back was used in the Group 1; while, the FanCut technique performed with 0% tension on the overall back was used in the Group 2. Exercise program was carried out 2 days a week for 6 weeks under the supervision of a physiotherapist in both groups. Pain intensity and severity of fatigue with the Visual Analog Scale and health status with the Fibromyalgia Impact Questionnaire were evaluated at the baseline and after the 6-weeks treatment.

Results: Physical characteristics of the groups were similar (p_{age}=0.190, p_{bmi}=0.808). After the treatment, it was found that pain intensity (p=0.001; p=0.001) and the severity of fatigue (p=0,001; p=0.003) decreased and health status (p=0.001; p=0.002) improved in both the group 1 and 2, respectively. Moreover, fatigue decreased (p=0.008) and health status improved (p=0.021) in the group 1 in comparison to the group 2; but pain intensity (p=0.085) did not differ between the groups.

Conclusion: In this study, it was observed that both the fascial correction and the FanCut KT applications were effective in decreasing pain and fatigue, and improving the health status of women with FM. In addition, the study suggested that the fascial correction KT application was superior in decreasing fatigue and improving health status in comparison to the FanCut KT application in women with FM. In clinics, the KT application may be considered as a non-pharmacologic and complementary therapy to improve the symptoms of FM. Moreover, the fascial correction KT application may be more effective in improving some parameters due to fascia dysfunction in FM.

EFFECTS OF N-ACETYLCYSTEINE ON PULMONARY FUNCTIONS IN PATIENTS WITH SYSTEMIC SCLEROSIS: A DOUBLE BLIND, PLACEBO CONTROLLED STUDY

M. A. Nazarinia[1,2], S. Mehrabi[3], Z. Khodamoradi[4], M. Mazidi Moradi[3]. [1]*Shiraz University of Medical Sciences, Shiraz, Iran, Division of Rheumatology, Department of Internal Medicine, Namazee Hospital, Shiraz, Iran (Islamic Republic of)*; [2]*Shiraz University of Medical Sciences, Shiraz, Iran, Shiraz Geriatric Research Center, Shiraz, Iran (Islamic Republic of)*; [3]*Shiraz University of Medical Sciences, Shiraz, Iran, Department of Internal Medicine, Namazee Hospital, Shiraz, Iran (Islamic Republic of)*; [4]*Shiraz University of Medical Sciences, Shiraz, Iran, Student Research Committee, Shiraz, Iran (Islamic Republic of)*

Background: Systemic sclerosis (SSc) is a systematic and rare autoimmune disease that affects many organs. N-acetylcysteine (NAC), thiol containing compound, can act both as the precursor of reduced glutathione and direct scavenger of reactive oxygen species.

Objectives: We assessed the clinical effect of NAC on pulmonary function test of patients with diffuse scleroderma.

Methods: This study is a randomized double blind clinical trial that was done on 25 patients with diffuse SSc without lung involvement on primary chest high-resolution computed tomography. Placebo was administered for 13 patients and 1200 milligram NAC for 12 patients. Body plethysmography parameters were assessed at the beginning of the study and after 24 weeks.

Results: Patients in the two groups were matched in the basic demographic data like age, duration of disease, and modified Rodnan skin score. The analysis showed no significant differences in parameters of plethysmography between the two groups. After importing the data of 2 patients in the placebo-treated group, who developed interstitial lung disease, DLCO in the placebo-treated group was 90.69 ± 21.29 milliliter at the end of the study, which significantly decreased compared with the beginning of the study (102.30 ± 13.83 ml). Also, changes of DLCO between the two groups were significantly different.

Conclusion: In this trial, sensitivity of DLCO as the first marker in evaluation of pulmonary function in patients with SSc was confirmed. On the other hand, NAC had no effect versus placebo in a period of 24 weeks. We recommend that more studies with larger sample size and longer duration should conduct for further evaluation.

ECONOMIC EVALUATION OF THE DR. BART APP IN PEOPLE WITH KNEE AND/OR HIP OSTEOARTHRITIS

T. Pelle[1,2], K. Bevers[1], F. Van den Hoogen[1,2], J. Van der Palen[3], C. Van den Ende[1,2]. [1]*Sint Maartenskliniek, Nijmegen, Netherlands*; [2]*Radboudumc, Nijmegen, Netherlands*; [3]*University of Twente, Enschede, Netherlands*

Background: Self-management is of paramount importance in non-surgical treatment of knee and/or hip osteoarthritis (OA). Modern technologies offer the possibility to support self-management 24/7. We developed an e-self-management application (dr. Bart app) for people with knee and/or hip OA[1].
Objectives: To evaluate the (incremental) cost-utility and cost-effectiveness of the dr. Bart app compared to usual care in people with knee/hip OA, applying a health care perspective.
Methods: This economic evaluation was conducted alongside a 6-month randomized controlled trial, in which 214 participants were offered to use the dr. Bart app for 6 months and 213 participants received care as usual. Health care costs were measured using self-reported questionnaires. Clinical outcome measures were quality-adjusted life years (QALYs) according to the EuroQol (EQ-5D-3L), the EuroQol rating scale (QALY-TRS), and the five subscales of KOOS/HOOS. Cost and effect differences were estimated using longitudinal linear mixed models and cost-effectiveness acceptability curves. Bootstrapping was used to estimate statistical uncertainty.
Results: Mean age of participants was 62.1 (SD 7.3) years, with the majority being female (72%) (Table 1). The difference in health care costs was non-significantly in favour of the intervention group (€-31.12 (95% CI: -66; 3)). Table 2 shows estimated treatment effects over 6 months. We found small but positive effects on symptoms, pain and activities of daily living (ADL) in favour of the dr. Bart app group. For QALY and QALY-TRS, the probability of the dr. Bart app being cost-effective compared to usual care was 0.80 and 0.60 at a willingness to pay (WTP) of €10.000 and 0.72 and 0.44 at WTP €80.000, respectively. For symptoms, pain and ADL, the probability that dr. Bart app was cost-effective was > 82% and for activities and quality of life < 40%, regardless of WTPs.

Table 1. Baseline characteristics.

	Dr. Bart app group (n=214)	Control group (n=213)
Age, years; mean (SD)	62.1 (7.7)	62.1 (7.0)
Female, n(%)	147 (68.7)	159 (74.7)
BMI, kg/m^2; mean (SD)	27.8 (5.1)	27.3 (4.8)
Main OA-location, knee; n(%)	157 (73.4)	156 (73.2)

Conclusion: This economic evaluation, from a health care perspective, showed that costs were not significantly lower for the dr. Bart app group compared to usual care. Given the non-invasive character of the intervention and the moderate probability to be cost-effective for the majority of outcomes, the dr. Bart app has only the potential to serve as a trustworthy tool to provide education and goal setting regarding OA and its treatment options.

Table 2. Estimated treatment effects over 6 months.

	Estimated difference over 6 months between groups (95% CI)*	WTP €10,000	WTP €80,000

HYPERBARIC OXYGEN THERAPY IN FIBROMYALGIA PATIENTS – DOUBLE-BLIND PROSPECTIVE CLINICAL TRIAL

B. Raffeiner[1], F. Ometto[2,3], D. Astorri[3], C. Botsios[3], G. Pulga[4]. [1]*Bolzano Hospital, Medicine Department, Bolzano, Italy*; [2]*Local Health Unit 1, Medicine Department, Belluno, Italy*; [3]*University of Padova, System's Department, Padova, Italy*; [4]*Bolzano Hospital, Hyperbaric Unit, Bolzano, Italy*

Background: Hyperbaric Oxygen Therapy (HOT) proved effective in improving of symptoms of patients affected by fibromyalgia syndrome (FMS) [1].
Objectives: The objective of the present study was to evaluate the effectiveness of HOT compared to hyperbaric treatment with no oxygen therapy (PBO) in the symptoms and working ability in FMS.
Methods: We conducted a prospective trial in employed patients with FMS, randomly assigned to HOT or PBO. Patients and evaluating clinicians were blinded to the treatment. HOT arm comprised 40 sessions, 5 days/week, 120 minutes, 100% oxygen at 2ATA; PBO comprised the same sessions without oxygen. Evaluations were at baseline, after 4 (T1) and 8 weeks (T2). Parameters considered were: socio-demographics, biochemistry, clinical evaluation and patient-reported outcomes (PROs). Baseline assessment included questions BELIEF (how much do you hope to improve with this treatment) and HOPE (how much do you expect to improve with this treatment), with VAS response. Spearman's, Mann-Whitney's, Kruskal-Wallis and Fisher's Exact test were used.
Results: 12 patients were included and completed the study, 6 in each arm (Tab. 1). No significant difference was observed in clinical measures or PROs at T1 and T2 between HOT and PBO arms, except for Working Productivity and Activity Impairment Questionnaire (WPAI) (result III) (Tab. 2). In both arms, disease duration was associated with worse PROs (Widespread pain index r=0.59,p=0.037, Severity Score r=0.81,p=0.025); higher BMI with improvement in function at T2 (r=0.63,p=0.027); higher baseline scores in BELIEF with reduction symptoms number (r=-0.67, p=0.021), higher scores in HOPE with reduction in Health Assessment Questionnaire (r=-0.057, p=0.039)

Table 1. Patients characteristics

AB1316-HPR COMORBIDITIES IMPACT ON PHYSICAL REHABILITATION PROGRAM OUTCOMES IN PATIENTS WITH KNEE OSTEOARTHRITIS

V. Salaru[1], A. Vizdoaga[2], L. Mazur-Nicorici[3], M. Cebanu[4], T. Rotaru[5], S. Vetrila[3], M. Garabaju[3], N. Loghin-Oprea[3], V. Sadovici-Bobeica[3], M. Mazur[3]. *[1]State University of Medicine and Pharmacy "Nicolae Testemitanu", Family Medicine, Chișinău, Moldova, Republic of*; *[2]University Medical Rehabilitation Center, Medical Rehabilitation, Physical and Manual Therapy, Chișinău, Moldova, Republic of*; *[3]State University of Medicine and Pharmacy "Nicolae Testemitanu", Internal Medicine, Chișinău, Moldova, Republic of*; *[4]State University of Medicine and Pharmacy "Nicolae Testemitanu", Emergency Medicine, Chișinău, Moldova, Republic of*; *[5]Institute of Cardiology, Chișinău, Moldova, Republic of*

Background: Physical rehabilitation is proposed as a method of non-pharmacological treatment of knee osteoarthritis (OA) by the EULAR and OARSI recommendations. At the same time, presence of concomitant diseases could influence the condition of patients and the outcomes of the rehabilitation program.
Objectives: To evaluate the frequency of comorbidities in OA patients and to appreciate their impact on outcomes of the physical rehabilitation program.
Methods: A prospective control case study was conducted in the University Rehabilitation Center. The patients underwent clinical examination, VAS scale was used to assess level of pain, and Knee Injury and Osteoarthritis Outcome Score (KOOS) with 5 domains (Pain, Symptoms, ADL, Sport, QoL) for joint function assessment. These parameters were evaluated at the onset of the program (T0) and at the end of the 10th day (T1). Medical data records, general clinical exam and Charlson Comorbidities Index (CCI) assessed the comorbidities.
Results: 48 patients with OA were included in the study, 37 patients of them were found with comorbidities. The most frequent associated diseases were: cardiovascular- 76.6%, obesity-59.9%, and endocrine - 12.9% cases. At T0, significantly lower levels in the group with comorbidities were identified on the domains Pain, Sport and QoL. The CCI in patients with comorbidities was 3.29 ± 0.14 points (82.1% for 1-year survival rate). At the T1 moment, we found an improvement in joint functionality in both groups. The mean value of the VAS score group of patients without comorbidities decreased from 48,18 mm to 21,36 mm ($p < 0.05$) and for the group of patients with comorbidities – 64,2 at / 36,2 mm ($p<0.001$). Significant improvement in joint function in the comorbidities group was in Pain ($p < 0.01$), Sport ($p < 0.05$) and Qol ($p < 0.01$) domains, at the same in patients without comorbidities, the improvement was significant in all 5 domains.
Conclusion: Comorbidities are highly associated to knee osteoarthritis and prove to have a negative influence on the results of the physical rehabilitation program; therefore, we would recommend to apply individualized rehabilitation programs adapted to the associated conditions of each patient.

AB1317-HPR YOGA-THERAPY: IMPROVEMENT IN PSORIATIC ARTHRITIS PROMS AT 4 MONTHS

C. B. Colaco[1], V. Sadana[2], K. Anie[2]. *[1]LNWUH NHS Trust, CMH Rheumatology Unit, London, United Kingdom*; *[2]LNWUH NHS Trust, CMH Rheumatology Unit, London, United Kingdom*

Background: Psoriatic Arthritis and Psoriasis have a major impact on QOL with associated mood disorders and Cardiovascular disease and Cancer as inter-related co-morbidities [1]. Yoga therapy (Y-T) has been used in several Long Term Conditions [2] and we have reported Rapid improvement in Proms in RA (RCP 2018) and so compared results of a PsA cohort offered the same Y-T intervention.
Objectives: This first in UK PsA study investigated: a) impact of a 16 week Y-T intervention on functional outcomes and QOL in 10 PsA patients, b) acceptability and experiences of the intervention. We present results in comparison to a previously reported RA cohort n=10.
Methods: Ten adult PsA patients (2 M 8 F Age 32-67 Avg: 53.7 Y; PsA diagnosis: 6.45 yrs:1 Juvenile onset) consented to 10 individual Y-T sessions (weekly x 4; biweekly x 6) with a yoga therapist in a standard consulting room. The intervention was tailored to the needs and abilities of each patient and included: breath-centered physical yoga postures, breathing and visualization techniques, mantras and meditation, with supportive Lifestyle/behavioural strategies. All participants completed measures pre- and post-intervention (EQ-5D HAQ HADS PGIC) to assess change in health status.
Results: A 10 session course of Y-T over 16 weeks was completed with 92/100 PsA YT sessions. Note 1 patient had unrelated Trauma and withdrew after 2 sessions. This confirms acceptability of delivery in a clinic setting and all participants reported strong adherence to practices (0-1) and strong belief (0-2) in impact of yoga. (Likert 5 point 0-4 scale).
Further data on only 9 PsA participants will be presented in comparison to the previous RA cohort of 10.
PsA patients n=9: Pain reduced 25 % HADs Depression reduced 39% Anxiety reduced 25%
HAQ health score improvement was significant at $P<0.04$ (ANOVA).
EQol 5d(3L) improved 24% but overall QOL remained below 50% max calculated TTO.
RA patients had recorded stable overall TTO at a higher level 0.63 pre and post Y-T.
PGIC record of positive change is recorded as a reduction on VAS from 5/5 to 2.4/5.
We will add 12 month FU data set in PsA to compare with 24 month data in the RA cohort.
Conclusion: Yoga-Therapy is deliverable and acceptable in a NHS clinic setting for PsA. Improved PROMS begs further larger studies of mechanisms of bio-psychosocial intervention in long term inflammatory conditions. The outcomes support the Poly Vagal Theory [3] as an effector model, via the bio-mechanistic neuro-inflammatory reflex [4]. We propose further Health Economic analysis of this 2500 yr old Yoga model for long term conditions to examine any long term cost benefit to the NHS.

AB1318-HPR VAGUS NERVE STIMULATION IN PATIENTS WITH RHEUMATOID ARTHRITIS: 48 MONTH SAFETY AND EFFICACY

F. Koopman[1], A. Musters[2], M. Backer[2], D. Gerlag[2], S. Miljko[3], S. Grazio[4], S. Sokolovic[5], Y. Levine[6], E. Glass[6], D. Chernoff[6], N. De Vries[2], P. P. Tak[2]. *[1]Academic Medical Center/University of Amsterdam, Amsterdam, Netherlands*; *[2]University of Amsterdam, Amsterdam, Netherlands*; *[3]University Clinical Hospital, Mostar, Bosnia and Herzegovina*; *[4]Clinical Hospital Center Sestre Milosrdnice, Zagreb, Croatia*; *[5]Sarajevo University Clinical Center, Sarajevo, Bosnia and Herzegovina*; *[6]SetPoint Medical, Valencia, United States of America*

Background: Rheumatoid arthritis (RA) is a disease with significant remaining unmet medical needs for better treatments. Vagus nerve stimulation (VNS) to activate the inflammatory reflex (cholinergic anti-inflammatory pathway) represents a novel experimental therapy for RA.[1] Previously, we reported that inflammatory reflex activation by VNS reduced pro-inflammatory cytokine production and improved disease activity in a 17-patient rheumatoid arthritis (RA) proof-of-concept study using a reprogrammed epilepsy stimulator2; clinical improvement was sustained for 24 months without untoward safety signals.[3] Here we report the 48 months results from this long-term observational study.
Objectives: Determine the long-term safety and efficacy of VNS for the treatment of RA
Methods: In the primary study, a VNS device was implanted into 17 RA patients, mostly with insufficient response to multiple conventional and biologic DMARDs, on stable background of methotrexate (≤25 mg weekly) therapy[2]. The device electrically stimulated the vagus nerve, 1-4 min/day, over a 12-week open label

period. On completion, subjects were offered to enroll into a follow-up study, where the study physicians were given flexibility to alter VNS dosing parameters and/or to add a biologic disease-modifying antirheumatic drug (DMARD) to the treatment regimen to induce disease remission. Clinical disease activity measures and safety were accessed over 4 years.

Results: All patients electively continued VNS treatment in the long-term follow-up study, 4 subjects withdrew prior to month 48. Reasons for discontinuation were withdrawal of consent (N=3) and adverse event due to device discomfort (N=1). At the start of the follow-up study, the mean DAS28-CRP, CDAI and HAQ-DI were significantly reduced compared to the pre-implant baseline (mean difference± SD: DAS28-CRP=-1.60± 1.13, p<0.001; CDAI=-21.19± 13.5, p<0.001; HAQ-DI=-0.44± 0.49, p<0.01), and this effect was retained through 48 months. Patients using VNS monotherapy and those using a combination of VNS with biologic DMARDs exhibited stable improvements in DAS28-CRP, CDAI and HAQ-DI at month 48 (Table 1). Improvements were observed for patients who both previously had an insufficient response to targeted biological therapies as well those who had an insufficient response to standard DMARDs. No association was seen between DAS28-CRP and stimulation frequency (Range= 1X-8X/day). There was no difference in the adverse events profile between the two groups.

Table 1. Efficacy of VNS treatment.

	Treatment Reinitiated N=9			VNS Monotherapy N=8			Total N=17		
	Mo. 24	Mo. 36	Mo.48	Mo. 24	Mo. 36	Mo. 48	Mo. 24	Mo. 36	Mo. 48
	Mean change from baseline (SD)								
DAS28-CRP	-2.58 (1.0)***	-2.40 (1.0)**	-2.28 (1.3)**	-2.61 (1.3)*	-1.77 (1.8)	-2.0 (1.7)	-2.59 (1.1)***	-2.19 (1.2)**	-2.17 (1.4)**
CDAI	-24.06 (8.3)***	-18.02 (13.3) *	-16.2 (19.6)	-33.5 (11.1)***	-27.8 (16.0)*	-27.9 (12.7)*	-28.20 (10.5)***	-21.93 (14.5)*	-20.83 (17.5)*
HAQ-DI	-.60 (0.64)*	-.63 (0.45)*	-.31 (0.60)	-.89 (0.69)*	-.88 (0.92)	-.88 (0.61)	-0.73 (0.66)***	-0.73 (0.64)**	-0.54 (0.64)*

*P<0.05, **P<0.01, ***P<0.001 versus primary study baseline (month -3.5)

Conclusion: VNS was safe, well-tolerated, and resulted in significant and clinically important improvements in disease activity measures that were maintained over 48 months. These results support development of VNS devices as a new therapeutic option for RA treatment.

AB1319-HPR EFFECT OF SEGMENTAL STABILIZATION AND PILATES ON CHRONIC NON-SPECIFIC LOW BACK PAIN: PILOT STUDY

A. Torres Cruz[1], P. De Oliveira Januário[1], I. Coelho Baptista[2], A. Da Rocha Rodrigues[2], C. H. Chagas Bernardo[2], T. Silva Nunes[2], M. Antunes[1], I. Merllin Batista de Souza[1], A. Pasqual Marques[1]. *[1]Universidade de São Paulo, Department of Physical Therapy Speech Therapy and Occupational Therapy, São Paulo, Brazil*; *[2]Centro Universitário de Barra Mansa, Department of Physical Therapy, Barra Mansa, Brazil*

Background: Low back pain is an important health condition with major socioeconomic consequences and is associated with high costs for the health system, absenteeism at work and reduced functional performance. It is one of the most relevant health problems in the elderly, with point prevalence estimates higher than other musculoskeletal conditions.

Objectives: To verify the effect of segmental stabilization versus the Pilates method in the elderly with chronic low back pain.

Methods: The study included 9 elderly women with chronic low back pain randomized into two groups: Segmental Stabilization Group (SG n = 5; age 65.2 ± 4.32; Body Mass Index - BMI 29.99 ± 4.65) and Pilates Group (PG n = 4; age 67.75 ± 7.13; BMI 26.49 ± 4.06). Both groups underwent 16 individual sessions of 60 minutes twice a week and avaliated before and after 8 weeks. Pain was assessed using the Visual Analogue Pain Scale; functional disability, by Oswestry's disability index; excessive fear of movement and physical activity, using the Tampa Kinesiophobia Scale; level of confidence in the balance for specific activities, on the Activity-Specific Balance Confidence (ABC) scale and; activation of the transverse muscle of the abdomen, by the pressure biofeedback unit Stabilizer of the Chatanooga brand. The allocation and evaluations of the participants were performed by a blind examiner. The data were analyzed using the Student's t-test with the level of significance (p≤0.05).

Results: The data show significant differences in the reduction of pain intensity (p= 0.022) and functional disability (p=0.023) only in SG and improvement in kinesiophobia (p=0.007) only in PG. The level of confidence in the balance for specific activities was better in the SG when compared to the PG (p=0.059). There was no difference in the activation of the transversus abdominis in both groups.

Conclusion: The results indicate that the segmental stabilization was effective to improve pain and functional disability, Pilates to improve the degree of kinesiophobia and the SG obtained a better result when compared to the PG regarding the level of confidence in the balance for specific activities. Both techniques had a great effect on improving functional capacity and on the level of confidence in the balance for specific activities. It is suggested to carry out studies with a larger number of participants and follow-up evaluation to assess the long-term effects.

AB1320-HPR THE ASSOCIATION BETWEEN PHYSICAL ACTIVITY AND CARDIORESPIRATORY FITNESS IN PATIENTS WITH RHEUMATOID ARTHRITIS AND HIGH CARDIOVASCULAR RISK

J. Van den Hoek[1], M. Van der Leeden[2], G. Metsios[3], G. Kitas[4], H. Jorstad[2], W. Lems[2], M. Nurmohamed[2], M. Van der Esch[5]. *[1]Amsterdam Rehabilitation Research Center | Reade, Amsterdam, Netherlands*; *[2]Amsterdam University Medical Centers, Amsterdam, Netherlands*; *[3]University of Wolverhampton, West Midlands, United Kingdom*; *[4]Russel's Hall Hospital, West Midlands, United Kingdom*; *[5]Amsterdam Rehabilitation Research Center | Reade, Amsterdam, Netherlands*

Background: Rheumatoid arthritis (RA) is associated with increased risk of cardiovascular disease (CVD) disease and CV mortality[1]. High values of cardiorespiratory fitness (CRF) are protective against CVD and CV mortality[2]. Physical activity levels in patients with RA are low. Knowledge on whether physical activity is associated with CRF in patients with RA and high CV risk is scarce. This knowledge is important because improving the level of physical activity could improve CRF and lower CV risk in this group of patients with RA and high CV risk. However, it is unclear whether physical activity is associated with CRF in this group of patients. This study presents the preliminary results at baseline of the association of physical activity with CRF from an ongoing pilot study aimed at improving CRF through exercise therapy in patients with RA and high CV risk.

Objectives: To determine (i) the level of physical activity in patients with RA and high CV risk and (ii) whether physical activity is associated with CRF in patients with RA and high CV risk.

Methods: Patients with RA and high CV risk participated in this pilot study. Increased 10-year risk of CV mortality was determined by using the Dutch SCORE-table. Anthropometrics and disease characteristics were collected. Physical activity was assessed with an Actigraph accelerometer to determine the number of steps and intensity of physical activity expressed in terms of sedentary, light, and moderate-to-vigorous time per day. Participants wore the accelerometer for seven days. A minimum of four measurement days with a wear time of

at least 10 hours was required. The VO_2 max measured with a graded maximal exercise test was used to determine the CRF. Pearson correlation coefficients were calculated for the associations between the different measures of physical activity and VO_2max. For the variables that were associated, linear regression analysis was carried out, with pain and disease activity as possible confounders.
Results: Thirteen females and five males were included in the study. The mean age was 66.5 (± 15.0) years. Only 22% of the patients met public health physical activity guidelines for the minimal amount of 150 minutes a week. The mean step count was 6237 (± 2297) steps per day and mean moderate-to-vigorous physical activity time was 16.50 (± 23.56) minutes per day. The median VO_2max was 16.23 [4.63] ml·kg^{-1}·min^{-1}, which is under the standard. Pearson correlations showed a significant positive association for step count with VO_2max. No associations were found for sedentary, light, and moderate-to-vigorous physical activity with VO_2max. The significant association between step count and VO_2max($p = 0.01$) was not confounded by disease severity and pain.
Discussion: Since better CRF protects against CVD, increasing daily step count may be a simple way to reduce the risk of CVD in patients with RA and high CV risk. However, these results need to be confirmed in a larger study group. Future research should investigate if improving daily step count will lead to better CRF levels and ultimately will lead to a reduction in CV risk in patients with RA and high CV risk.
Conclusion: Physical activity levels of patients with RA and high CV risk do not meet public health requirements for physical activity criteria and the VO_2max was under the standard. Step count is positively associated with CRF.

HPR Patients' perspectives, functioning and health (descriptive: qualitative or quantitative)

AB1321-HPR **DEVELOPING A SELF-MANAGEMENT INTERVENTION TO MANAGE JOINT HYPERMOBILITY SYNDROME AND EHLERS-DANLOS SYNDROME HYPERMOBILITY TYPE: AN ANALYSIS INFORMED BY BEHAVIOUR CHANGE THEORY**

S. Bennett[1], N. Walsh[1], T. Moss[1], S. Palmer[1]. [1]*University of the West of England - UWE Bristol, Faculty of Health and Applied Sciences, Stoke Gifford, United Kingdom*

Background: Joint Hypermobility Syndrome (JHS) and Ehlers-Danlos Syndrome Hypermobility Type (EDS-HT) are heritable disorders of connective tissue that can cause joint instability and pain and are associated with increased anxiety and depression. There is currently little UK guidance for supporting patients with JHS/EDS-HT [1]. The analysis presented here used the Behaviour Change Wheel (made up of the Theoretical Domains Framework (TDF) and Capability, Opportunity, Motivation and Behaviour (COM-B) model[2]) to identify possible intervention options to improve self-management in people with JHS/EDS-HT.
Objectives: To determine recommendations for the components of a behaviour change intervention for people with JHS or EDS-HT.
Methods: Data from: 1) A systematic review and thematic synthesis of the literature examining adults' lived experiences of JHS/EDS[3] and 2) A thematic analysis of interview data where UK adults with JHS/EDS-HT (n=17, 14 women, 3 men) discussed the psychosocial impact of the condition on their lives[4], were mapped onto the TDF and COM-B in a behavioural analysis. A modified Nominal Group Technique focus group (n=9, all women) explored which interventions identified by the TDF/COM-B mapping exercise were most important to them.
Results: Participants prioritised a range of potential self-management interventions, including:
Education: Participants wanted greater support to improve their knowledge of JHS/EDS-HT, including self-help strategies for coping with injury, fatigue and overexertion, and how to evaluate information about their condition.
Training: In activity pacing, assertiveness and communication skills, and what to expect during pregnancy, when symptoms of JHS/EDS-HT can worsen.
Environmental restructuring and enablement: Support from occupational therapists to maintain independence at home. Enablement of access to CBT, mindfulness and emotional support.
Modelled behaviour: Positive first-person narratives that address how other patients with JHS/EDS-HT have coped with anxiety, depression, distress, fear, frustration and feelings of loss.
Conclusion: This study is the first to apply theoretically-informed approaches to the management of JHS/EDS-HT. Through a modified nominal group technique, potential behaviour change interventions for addressing barriers to self-management have been prioritised. Discussion with participants indicated poor access to psychological support, occupational therapy and a lack of knowledge of JHS/EDS-HT. Future research with healthcare professional and patient stakeholder groups will further evaluate which intervention options would be most acceptable and feasible for the management of JHS/EDS-HT.

AB1322-HPR **NON-INFECTIOUS ACUTE INFLAMMATORY ARTHRITIS IN JOINT ARTHROPLASTY**

L. Berbel Arcobé[1], L. Gomez Garcia[2], M. C. Bernaus Johnson[3], F. Angles Crespo[3], S. Martinez Pardo[1], L. Font Vizcarra[3]. [1]*Mútua Terrassa University Hospital, Rheumatology, Terrassa, Spain*; [2]*Mútua Terrassa University Hospital, Internal Medicine, Terrassa, Spain*; [3]*Mútua Terrassa University Hospital, Orthopaedic Surgery and Traumatology, Terrassa, Spain*

Background: Acute inflammatory arthritis (AIA) in a native knee joint is a common pathology with a well-defined differential diagnosis which includes crystal-induced arthritis. Presenting symptoms in a knee joint arthroplasty (KJA) can mimic a periprosthetic hematogenous infection (PHI). There are few studies in current literature that describe possible causes of non-infectious arthritis in KJA. PHI requires, in most cases, an urgent combined surgical and antibiotic (AB) treatment. Describing and studying other possible diagnoses that may resemble PHI in a KJA is mandatory in order to minimize diagnostic errors and avoid unnecessary treatments.
Objectives: To analyze the characteristics of AIA in KJA with negative cultures in patients with an initial diagnosis suspicion of PHI.
Methods: A retrospective case series was conducted at a tertiary-level hospital including all patients diagnosed with an AIA in KJA with negative cultures from January 2012 to December 2019. Demographic data, clinical presentation, management and outcomes were recorded and analyzed.
Results: A total of 11 cases in 9 patients were included (6 females and 3 males) with a median age of 69 years at the time of diagnosis. All patients had risk factors for AIA (6 had chondrocalcinosis (CC), 2 hyperuricemia and 1 psoriasis). However, crystal deposits in synovial fluid (SF) for none of the patients had been previously found.
The median time from the index surgery to clinical presentation was 6 months, and from initial clinical presentation signs to referral was 24 hours. All cases presented with pain and swelling and 5 presented with erythema. Median body temperature on admission was 37.2ºC. All patients presented with no acute distress. Initial blood tests showed a median white blood cell count and CRP of 11.160/mm3 and 90mg/L, respectively. Blood and SF cultures were taken for all cases. The median white blood cell count in SF was 75.883/mm3.
Three cases had received AB treatment during a median of 6 days prior to microbiological sampling. After initial sampling, 6 cases received AB prior to surgery, 1 received AB after surgery, 1 received only AB and 3 were treated only with NSAIDs. In all cases, surgical treatment consisted in radical surgical debridement and polyethylene insert exchange.
Further blood and SF tests were performed 4 days after admission. The mean decrease for systemic white blood cell count, CRP and synovial leukocyte count was 46%, 58% and 56%, respectively. All cultures were negative and crystal deposits were not identified for any of the samples.
The median duration of symptoms was 127 days with a good outcome. 6 patients received AB for a median of 69 days.
Conclusion: Non-infectious AIA in KJA is a rare entity that should be accounted for the differential diagnosis of periprosthetic joint infection. The initial diagnosis

of infection could not be confirmed, although three patients had taken AB before sampling. It is important for physicians to have a suspicion for non-infectious arthritis, especially in patients with clinical and blood test result dissociation, radiological CC, medical history of hyperuricemia or psoriasis, in order to avoid unnecessary AB and surgical treatment.

AB1323-HPR A QUALITATIVE EXPLORATION OF THE PERSONAL FINANCIAL TOLL OF ARTHRITIS

D. Berkovic[1], D. Ayton[1], A. M. Briggs[2], I. Ackerman[1]. [1]*Monash University, Melbourne, Australia*; [2]*Curtin University, Melbourne, Australia*

Background: The financial experience faced by working-age people with arthritis includes living below the poverty line for many (1). Financial distress amongst people with arthritis is known to contribute to poorer health outcomes, including high psychological distress and more severe pain (2). Despite the demonstrated societal cost of arthritis care and management, the personal costs borne by the individual are not well understood in different health systems (3).

Objectives: To explore the perceived financial impacts of living with arthritis amongst working-age individuals aged 18 – 50 years in Australia.

Methods: A qualitative descriptive study design was used. Participants with inflammatory arthritis or osteoarthritis were recruited from the community, including urban and rural settings. An interview schedule was developed, informed by existing literature (4), which was piloted prior to data collection. Deductive and inductive coding techniques were used to identify financial-related themes arising from the data.

Results: Semi-structured interviews were conducted with 21 younger people (90% female) with a mix of arthritis conditions including rheumatoid arthritis, psoriatic arthritis, osteoarthritis, and ankylosing spondylitis. Four themes were identified: direct arthritis-attributable medical costs, indirect arthritis-attributable costs, insurance and pension costs, and broader financial impacts on the family. Non-subsidised costs were frequently referenced by participants as burdensome, and existed even within the publically-funded healthcare system. Financial distress was characterised by participants as chronic, onerous for the entire family, and associated with exacerbation of physical symptoms.

Conclusion: People with arthritis and of working age experience significant arthritis-attributable financial burden and related distress. Financial concerns should be actively identified and considered within shared clinical decision making, in order to provide more patient-centred care for these individuals.

AB1324-HPR INVESTIGATION OF THE RELATIONSHIP BETWEEN SOCIAL APPEARANCE ANXIETY AND DISEASE DURATION, SELF-ESTEEM, ANXIETY AND DEPRESSION IN RHEUMATOLOGICAL DISEASES-PRELIMINARY STUDY

S. Y. Cetin[1], A. Ayan[2], A. Buyuk[3], T. Can Akman[4]. [1]*Akdeniz University, Department of Physiotherapy and Rehabilitation, Antalya, Turkey*; [2]*Antalya Training and Research Hospital, Rheumatology, Antalya, Turkey*; [3]*Akdeniz University, Physiotherapy and Rehabilitation, Antalya, Turkey*; [4]*Pamukkale University, Physiotherapy and Rehabilitation, Denizli, Turkey*

Background: Appearance anxiety means discomfort in social interactions due to changes in appearance. Also this anxiety; it is the fear of being evaluated negatively and worry about the changes in appearance, and it is not only apparent. Body image is the emotions, thoughts and perceptions of the individual about his or her own body and directly affects self-esteem. The Social Appearance Anxiety Scale (SAAS) was developed to assess social appearance anxiety, and this scale was found to be a valid and reliable scale in scleroderma (SSc) patients. It was also thought to be related to the severity of the disease. The literature shows that appearance concerns are strongly related to depression in patients with rheumatic disease and should be evaluated routinely.

Objectives: The first aim of the study is to determine the level of social appearance anxiety in rheumatology patients, and our last goal is to investigation of the relationship between social appearance anxiety and disease duration, self-esteem, depression and anxiety.

Methods: 129 rheumatology patients with a mean age of 42.96 ± 11.33 years (51 men, 78 women) were included in the study. 55% of patients were ankylosing spondylitis (AS), 15.5% of patients were sjögren syndrome (SS), 11.6% of patients were rheumatoid arthritis (RA), 7.8% of patients were fibromyalgia syndrome (FMS), 6.2% of patients were SSc, 2.3% of patients were Behçet's disease (BD) and 1.6% were diagnosed with psoriatic arthritis (PsA). The Social Appearance Anxiety Scale (SAAS) was used to evaluate patients' social appearance anxiety, the Rosenberg Self-Esteem Scale (RSES) was used to evaluate self-esteem, and the Hospital Anxiety and Depression Scale (HADS) was used to evaluate depression and anxiety.

Results: The disease duration was found to be 6.82 ± 5.22 years. The SAAS average was found to be 43.23 ± 20.53 points. It was found that the SAAS values of patients with PsA and SSc were higher than patients with AS, RA, FMS, SS, BD. A moderate positive correlation was found between SAAS and disease duration, depression and anxiety (p: 0.048, r: 0.545; p: 0.007, r: 0.638; p: 0.014, r: 0.749, respectively).

Conclusion: As a result of the study, it was observed that rheumatology patients had moderate and high level social appearance anxiety. We thought that they have a higher level of social appearance anxiety because of skin involvement in patients with with PsA and SSc. In addition, as a result of the study, we found that as the social appearance anxiety increased, disease duration, depression and anxiety increased. According to this study, in which the preliminary results are given, we thought that it is necessary to determine patients' appearance anxiety in routine evaluation and to reduce social appearance anxiety by collaboration with multidisciplinary areas in rheumatological diseases.

AB1325-HPR THE TRANSITION FROM PEDIATRIC TO ADULT RHEUMATOLOGY OF 347 PATIENTS AT A SINGLE CENTER

S. Ugurlu[1], B. H. Egeli[1], A. Adrovic[1], K. Barut[1], S. Sahin[1], M. Yildiz[1], O. Kasapcopur[1], H. Ozdogan[1]. [1]*Istanbul University- Cerrahpasa, Istanbul, Turkey*

Background: Pediatric to adult rheumatology transition can be a challenge for both the patient and the clinician, especially in rheumatology as it includes chronic diseases with close follow-up.

Objectives: The objective of this study is to understand our tertiary rheumatology center patient demographic transitioning from pediatric to adult rheumatology in order to design prospective studies enhancing the evidence of transition recommendations.

Methods: Patients included in this study are regularly followed-up in our adult rheumatology clinic and were regularly followed up in our pediatric rheumatology clinic in the past. They were all diagnosed with a rheumatologic condition receiving treatment. The patient files were assessed to have a better understanding of their demographic, disease and treatment information.

Results: Our cohort includes 347 patients diagnosed with a variety of conditions that are Familial Mediterranean Fever (FMF) (n=216), Juvenile Idiopathic Arthritis (JIA) (n=56), Juvenile Spondyloarthritis (jSPA) (n=39), Systemic Lupus Erythematosus (SLE) (n=20), Behçet's Disease (n=7) and the rest of the rheumatologic conditions with less than 5 patients each. The mean age of the patients during transition, mean age of diagnosis, and follow-up duration are 21.34±1.7, 10.4±4.18, and 10.82±4.4 in respective order. The treatment regimens the patients received are summarized in Table 1.

Table 1. Current Treatment Information of the Patients

Current Treatment Information	
DMARD	26
Colchicine	23
Adalimumab	21
Etanercept	10
NSAID	4
Tocilizumab	3
Cyclophosphamide	3
Rituximab	2
Prednisolone	7
Mycophenolate Mofetil	1
Canakinumab	1

Seven patients had FMF related attacks. In addition to attacks, one FMF patient had bilateral ankle pain and one patient had leg pain. One patient out of three diagnosed with Takayasu's disease was still symptomatic. One patient had uveitis-related symptoms. One patient diagnosed with SLE had skin dryness. Furthermore, there were patients with sequelae formation. One patient diagnosed with oligoarticular JIA (oJIA) had bilateral hip sequela with the additional left hip prosthesis. One oJIA patient had micrognathia, and one had left knee sequela. One pJIA patient had small joint sequelae. One sJIA patient had bilateral hip sequelae. One jSPA patient had enthesopathy. One FMF patient had proteinuria due to amyloidosis formation. Another FMF patient had hip surgery due to sequela.

Conclusion: Our center had patients with a variety of conditions with different natures of diseases. EULAR recommends the transition process to start no later than 14 years of age; however, this process started at the mean age of 21 in our patients. In most of these patients, especially the ones diagnosed with FMF, the control of disease activity was maintained. The transition of these different clinical entities might require certain amendments to the standard of care. For future references, we will be able to understand more about the adulthood prognosis of these clinical entities.

AB1326-HPR TOBACCO ADDICTION IN PEOPLE WITH RHEUMATOID ARTHRITIS – FROM THE PERSPECTIVE OF PATIENTS

B. A. Esbensen[1,2], I. K. Roelsgaard[1], S. K. Larsen[1], T. Thomsen[2,3].
[1]Copenhagen Center for Arthritis Research (COPECARE), Center for Rheumatology and Spine Diseases, Glostrup, Denmark; *[2]University of Copenhagen, Department of Clinical Medicine, Copenhagen, Denmark*; *[3]Herlev and Gentofte Hospital, Copenhagen, Herlev Acute, Critical and Emergency Care Science Unit, Department of Anaesthesiology, Herlev, Denmark*

Background: Smoking is one of the most significant modifiable exosomes risk factors for rheumatoid arthritis (RA) (1). Studies suggest that 25-30% of people with RA in Denmark smoke (2). This is almost twice as many as in the background population in Denmark. People with RA have a significant increased risk of severe comorbidity including cardiovascular disease. In addition, there are indications that smokers with RA have a poorer effect of the medical inflammatory treatment compared to non-smokers, and consequently more difficult to achieve remission of the disease activity (3). Tobacco addiction is complex and can be a challenge in smoking cessation. In addition to physiological dependence, habits and social and environmental factors may influence addiction. Tobacco smoking is associated with an addiction to nicotine and it is unexplored how this addiction appears in people with RA.

Objectives: The aim of this study was to examine from the patient's perspective how tobacco addiction appears in people with rheumatoid arthritis.

Methods: We conducted a qualitative study based on a hermeneutics approach. People with RA who previously had participated in a randomized controlled study (4) about smoking cessation conducted at the Center for Rheumatology and Spine Diseases at Rigshospitalet, Denmark were recruited for semi-structured interviews.

Results: In total, 12 people with RA (50% female) were included in the study. The median age was 62 years and median RA disease duration was 12 years. The degree of physical dependence measured by Fagerströms Test for Nicotine dependence (FTND) was on average: 4.9 (score: 0-10, 0=nonphysical dependence).

Three categories of how tobacco addiction appeared emerged during the analysis: 1) *It develops into ingrown habits* referring to the fact that smoking already in adolescence contributes to the development of specific physical, mental and social smoking behavior. Not all individuals considered themselves addicted to nicotine as they did not necessarily connect the nicotine to the ingrown habits. 2) *The body craves for nicotine* referring to nicotine proved calming, while a lacking or insufficient dose caused withdrawal symptoms. Furthermore, smoking became a habit where a craving for smoking occurred in certain situations. 3) *Ambivalence – for and against* referring to the physical dependence and smoking habits making a smoking cessation difficult. Dependency to nicotine and challenges to quit smoking led to a feeling of ambivalence and a lack of control.

Conclusion: Tobacco addiction appeared as a physical dependence and a habit, which, during a smoking cessation, led to ambivalent feelings. Therefore, based on this study, there is still a need for health professionals to talk to patients about smoking. But also, a need to articulate the complexity of addiction in order to support for smoking cessations. Information should be strengthened in the clinical practice in relation to nicotine's implication in tobacco addiction as well as the consequences of tobacco smoking for individuals with RA.

AB1327-HPR SELF-ASSESSMENT OF ORAL HEALTH STATUS IN RHEUMATOID ARTHRITIS, SYSTEMIC LUPUS ERYTHEMATOSUS AND CONTROLS

C. M. Gamboa-Alonso[1], J. D. Ángulo[1], M. J. Garza Martínez[1], G. Figueroa-Parra[1], A. L. De-Leon-Ibarra[1], J. C. Riegatorres[1], D. Á. Galarza-Delgado[1].
[1]Hospital Universitario José Eleuterio González, Rheumatology, Monterrey, Mexico

Background: Different periodontal disorders have been associated with the development of multiple rheumatic diseases, encouraging the production of citrullinated proteins and creating a proinflammatory state with an increase in oral and systemic symptomatology.

The Geriatric/General Oral Health Assessment Index (GOHAI) survey has been used as a self-assessment tool where studies have found a diminished quality of oral health in Rheumatoid Arthritis (RA).[1]

Objectives: Compare the behavior of GOHAI survey in RA, Systemic lupus erythematosus (SLE), and controls in a Rheumatology center at Northeast Mexico.

Methods: We performed a descriptive study of patients with RA and LES who answered the Spanish version of GOHAI survey. A control group was also included.

GOHAI survey consists of 12 Questions with Likert answers evaluating problems related to periodontal disease in the last 3 months.

Questions 1-4 evaluate physical function, 6, 7, 9-11 psychosocial status and 5, 8 and 12 pain.

Results: Sixty RA patients, 32 SLE patients and 46 controls were included. Groups were adjusted by sex and age.

GOHAI survey presented a total mean of 23.4 in RA, 22.06 in SLE and 21.54 in controls with a maximum score of 60 points.

When analyzing the survey in physical function and psychosocial status a statistical significant difference was found when comparing RA group to controls.

Table 1. Comparison between GOHAI index scores in RA, SLE and control groups

	RA n= 60	SLE n= 32	Controls n=46			
	Median (SD)	Median (SD)	Median (SD)	RA vs SLE	RA and controls	Three groups
Age	51.27 (15.84)	37.03 (14.14)	41.07(11.25)	**0.17**		
Sex	58 (96.67%)	29 (90.62%)	42 (91.3 %)			
1. Limit the kinds of food consumed	1.87 (1.14)	1.78 (1.15)	1.78 (0.81)			
2. Trouble biting or chewing	1.96 (1.2)	1.91 (1.27)	1.78 (1)			
3. Able to swallow comfortably	2.2 (1)	1.81 (1.47)	1.41(1.15)			
4. Unable to speak clearly	1.63 (1)	1.13 (0.42)	1.24(0.57)			
5. Able to eat without discomfort	1.9 (1.17)	1.59 (0.98)	1.76 (0.79)			
6. Limit contact with people	1.45 (0.9)	1.34 (0.75)	1.3 (0.73)			
7. Pleased with appearance of teeth	2.85 (1.65)	3.2 (1.79)	2.22(1.25)			
8. Use medication to relieve pain	1.83 (1.08)	1.94 (1.13)	1.87 (0.88)			

Table 1. Comparison between GOHAI index scores in RA, SLE and control groups

	RA n= 60	SLE n= 32	Controls n=46			
	Median (SD)	Median (SD)	Median (SD)	RA vs SLE	RA and controls	Three groups
9. Worried about teeth, gum or dentures	2.56 (1.39)	2.06 (1.54)	2.54(1.15)			
10. Self-conscious about teeth, gum or dentures	1.66 (0.94)	1.59 (1.02)	2.02 (1.06)			
11. Uncomfortable eating in front of others	1.54 (0.82)	1.53 (0.8)	1.39(0.8)			
12. Sensitive to hot,cold or sweet food	2.07 (1.06)	2.19 (1.31)	2.22(0.94)			
Total score (12-60)	23.4 (6.94)	22.06 (7.05)	21.54 (5.6)	**0.27**	**0.12**	**0.19**
Physical function	7.6 (3.32)	6.63 (2.6)	6.22 (2.26)	**0.15**	**0.06**	**0.05**
Psychosocial function	10.07(3.23)	9.72 (3.74)	9.48 (3.5)	**0.35**	**0.003**	**0.02**
Pain discomfort	5.78 (2.19)	5.72 (2.48)	5.85 (1.48)	**0.69**	**0.15**	**0.1**

RA: Rheumatoid Arthritis, SLE: Systemic Lupus Erythematosus

Conclusion: RA patients presented an increased alteration in oral health perspective when compared to SLE and controls. This association demonstrates the relationship between RA and periodontitis pathogenesis.
Importance in diagnosing periodontal disorders in rheumatic diseases should be performed due to its influence in quality of life and perpetuation of an inflammatory state and oral symptoms.

AB1328-HPR INCREASED BODY MASS INDEX AFFECTS SPINAL MOBILITY RATHER THAN DISEASE ACTIVITY IN ANKYLOSING SPONDYLITIS

M. He[1], Y. Bao[1], Y. Yang[1], S. Liu[1], C. Dong[1], W. Zhou[1], J. Guo[1], J. Liu[1], Y. Chen[1], Z. Gu[1]. [1]*Affiliated Hospital of Nantong University, Nantong, China*

Background: Studies have reported the association between overweight or obesity and ankylosing spondylitis (AS), but their relation is still unclear in China.
Objectives: To explore the prevalence of overweight or obesity and its effect on other indicators and their relationships in Chinese AS patients.
Methods: Demographic and clinical variables were collected from 207 AS patients. Patients were categorized to normal BMI group (BMI < 23kg/m^2) and overweight group (BMI ≥ 23kg/m^2). We used Bath Ankylosing Spondylitis Disease Activity Index (BASDAI), Bath Ankylosing Spondylitis Functional Index (BASFI), Bath Ankylosing Spondylitis Metrology Index (BASMI), Health Assessment Questionnaire (HAQ), Ankylosing Spondylitis Quality of Life (ASQoL) and Medical Outcomes Study Short Form 36 (SF-36) to evaluate disease activity, physical function, spinal mobility, functional limitation and health-related quality of life, respectively. Statistical analysis used independent t test, Mann-Whitney U test, Chi-square test and Spearman's rank correlation test.
Results: 56.5% (117) AS patients were overweight or obese, among which 80.3% (94) were male. In the overweight group, patients were older, more being married, and have higher BMI, higher waist circumference, higher waist-to-hip ratio, longer disease duration, higher BASMI score, higher white blood cell count (WBC), higher lymphocyte and higher platelet count compared to the non-overweight group ($P \leq 0.038$). However, there was no distinct difference in BASDAI score between the two groups ($P = 0.891$). In the correlation analyses, gender and marital status ($P \leq 0.036$) were correlated negatively with BMI; while age, waist circumference, waist-to-hip ratio, WBC, lymphocyte count and red blood cell ($P \leq 0.036$) were correlated positively with BMI.
Conclusion: Overweight or obesity is common in Chinese AS patients. Increased BMI affects not disease activity but spinal mobility, which indicates that patients with high BMI are more likely to have limitations in flexion, extension, lateral bending and torsion of spine.

AB1329-HPR THE CURRENT STATUS AND ASSOCIATED FACTORS OF FATIGUE IN CHINESE PATIENTS WITH GOUT

J. Guo[1], W. Zhou[1], M. He[1], Z. Gu[1], C. Dong[1]. [1]*Affiliated Hospital of Nantong University, Nantong, China*

Background: Fatigue of chronic diseases has been paid more and more attention. but the status of fatigue in gout patients has not been reported all the world[1].
Objectives: In the absence of previous studies, our study aims to investigate the fatigue status, explore the potential predictors of fatigue and the effects of fatigue on health-related quality of life (HRQoL) among Chinese gout patients.
Methods: This cross-sectional study was conducted from the Affiliated Hospital of Nantong University. A series of questionnaires were applied: Fatigue Scale-14 (FS-14), the 10 cm visual analog scale (VAS), the Patient Health Questionnaire (PHQ-9), the Generalized Anxiety Disorder questionnaire (GAD-7), the Pittsburgh Sleep Quality Index (PSQI), Health Assessment Questionnaire(HAQ), the Short Form 36 health survey (SF-36). Laboratory examinations were taken to obtain some biochemical indicators. Independent samples t-test, Mann–Whitney U-test, Chi-square analysis, Pearson /Spearman correlation, Stepwise linear regression and binary logistic regression were used to analyze the data.
Results: 411 gout patients were included in this study. Among them, more than 50% patients reported physical fatigue in FS-14, severe disease, poor psychological status and reduced HRQoL were associated with fatigue. Multiple stepwise linear regression and binary logistic regression were applied and showed that pain, sleep quality, anxiety, depression and functional disorder were the potential predictors of fatigue. In addition, we found that the more severe the fatigue, the lower the patient's HRQoL.
Conclusion: Fatigue among gout patients is exceedingly common. The results of this study suggested that rheumatologists should pay closely attention to gout patients who suffer from serious fatigue, especially those with pain, poorer sleep quality, anxiety, depression and functional disorder.

AB1330-HPR ASSOCIATION OF INTERSTITIAL LUNG DISEASE AND QUALITY OF LIFE IN CHINESE RHEUMATOID ARTHRITIS

Y. Wang[1], R. Zhao[1], C. Dong[1], Z. Gu[1]. [1]*Affiliated Hospital of Nantong University, Nantong, China*

Background: The health-related quality of life (HRQL) of patients with rheumatoid arthritis associated interstitial lung disease (RA-ILD) is less concerned(1). This study hypothesized that HRQL of such patients decreased.
Objectives: The aim of this study was to assess the difference in HRQL between RA with and without ILD, and to predict risk factors of HRQL in Chinese RA-ILD.
Methods: A cross-sectional survey of RA-ILD patients included socio-demographic characteristics, clinical variables, psychological factors and HRQL. Data were analyzed by Student's t or chi-square test. Linear regression analysis was used to investigate the predictors of HRQL in RA-ILD.
Results: The data showed that 35.17% (51/145) of RA patients had ILD. There are significant differences in age, sex, smoking history, disease duration and activity between RA with and without ILD. HRQL of RA-ILD was impaired. Physical component score (PCS) of patients with RA-ILD was also worse than that of RA without ILD (48.91±2.48 vs. 50.80±2.55). Linear regression analysis showed that DAS28 and fatigue were risk factors for PCS in patients with RA-ILD, while depression and rural residence were risk factors for mental components summary in Table 1.

Table 1. Stepwise multiple linear regression analysis of PCS and MCS in RA-ILD

Predictors	B	SE	t	*P*	95%CI
PCS					
DAS28	-0.777	0.227	-3.425	0.001	-1.236,-0.319
Fatigue	-0.655	0.206	-3.177	0.003	-1.071, -0.238
MCS					
Depression	2.188	0.669	3.272	0.002	0.836, 3.539
Rural residents	-1.609	0.756	-2.128	0.040	-3.137,-0.081

Footnotes: CI=Confidence interval. PCS=Physical component score; MCS=Mental component score; DAS28=28-joint disease activity score.

Conclusion: Compared with RA without ILD, HRQL of patients with RA-ILD was significantly impaired. Disease activity, fatigue, depression and rural residence were independent predictors of HRQL in Chinese RA-ILD.

AB1331-HPR ACTIVE DISEASE ACTIVITY IN ANKYLOSIS SPONDYLITIS: WORSE OUTCOMES AND POORER HR-QOL

W. Zhou[1], M. He[1], R. Zhao[1], C. Dong[1], Z. Gu[1]. [1]*Affiliated Hospital of Nantong University, Nantong, China*

Background: Ankylosing spondylitis (AS) is a chronic inflammatory disease that mainly affects the sacroiliac joints and the spine, resulting in decline in quality of life[1,2]. Poor QoL is significantly related to high disease activity[3]. However, there is no systematic report on which prognosis indicators are affected by disease activity in AS patients.

Objectives: This study aimed to evaluate the patient-reported outcome measures and health-related quality of life (HR-QoL) in AS patients defined on the basis of the Bath Spondylitis Ankylosing Disease Activity Index (BASDAI).

Methods: 204 AS patients were involved in this study. A serious of questionnaires were used to overall assess AS patients, which include: Bath Ankylosing Spondylitis Disease Activity Index (BASDAI), Bath Ankylosing Spondylitis Metrology Index (BASMI), Bath Ankylosing Spondylitis Functional Index (BASFI), the 10 cm Visual Analog Scale (VAS), the Self-Rating Anxiety Scale (SAS), the Self-Rating Depression Scale (SDS), the Pittsburgh Sleep Quality Index (PSQI), the Health Assessment Questionnaire-Disability Index (HAQ-DI), the Fatigue Severity Scale(FSS) and the Short Form 36 Health Survey (SF-36). Independent samples t-test, Mann–Whitney U-test, Chi-square analysis and Pearson /Spearman correlation were used to analyze the data.

Results: The results demonstrated 31.4% AS patients were in active disease activity stage. Active AS patients were older, unemployed, and had less exercise therapy than stable AS patients. Besides, AS patients with active disease activity presented more severe pain(P<0.001), poor physical function(P<0.001) and spinal mobility(P<0.001). They were more anxious(P<0.001), depressed(P<0.001) and had more sleep disturbance(P=0.001). Compared with active AS patients, stable AS patients had more leukocytes(P=0.040), lymphocytes(P=0.002), erythrocytes(P=0.001) and hemoglobin(P<0.001). Active disease activity had a significant impact on all dimensions of quality of life in AS patients(P<0.001).

Conclusion: These findings suggested that medical personnel should pay more attention to active AS patients and make effective interventions to improve quality of life.

AB1332-HPR ASSESSING THE PATIENT EXPERIENCE OF LUPUS NEPHRITIS: DEVELOPMENT OF A CONCEPTUAL MODEL AND REVIEW OF EXISTING PATIENT-REPORTED OUTCOME (PRO) MEASURES

P. Berry[1], K. Burrows[2], R. Hall[2], A. Gater[2], H. Bradley[2], A. Ward[2], C. Tolley[2], P. Delong[1], E. C. Hsia[3]. [1]*Janssen Global Services LLC, Horsham, United States of America*; [2]*Adelphi Values Ltd, PCO, Bollington, United Kingdom*; [3]*Janssen Research & Development LLC, Spring House, United States of America*

Background: Lupus nephritis (LN) is an autoimmune disease characterized by inflammation of the kidneys as a result of systemic lupus erythematosus (SLE). Approximately 50% of SLE patients will develop LN, which is considered to be one of the most severe manifestations of SLE and the leading cause of morbidity and mortality in SLE. While there is ample existing evidence on disease experience and PROs used in extra-renal SLE, little research has been done in LN. Qualitative interviews with patients can help identify concepts that are both important and relevant to the patient. In order to effectively evaluate treatment benefit, it is critical that PRO measures used to assess such concepts and define clinical trial endpoints are fit for purpose and have strong evidence of content validity in the specific context of use.

Objectives: The objective of this study was to understand the patient experience of LN and to identify and characterize the signs and symptoms of LN and their impact on health-related quality of life (HRQoL) through the development of a disease-specific conceptual model. This model was then used to evaluate the content validity of existing PRO measures available for use in LN.

Methods: A structured literature search was conducted in Medline, Embase and PsycINFO to identify qualitative research articles documenting the patient experience of LN. PRO measures developed or commonly used to assess patient experiences of LN were also identified. Semi-structured concept elicitation interviews were conducted with 15 adult patients in the US with a clinician-confirmed diagnosis of LN (defined in accordance with established clinical guidelines). Supplementary qualitative data were also collected from a review of publicly available online blogs/forums. Findings were used to inform the development of a conceptual model detailing the impact of LN signs, symptoms and HRQoL and evaluate the validity of existing measures used within LN.

Results: Searches revealed a paucity of qualitative research conducted with LN patients, supporting the need for prospective research in LN. Consistent with existing literature in SLE, the core signs and symptoms identified from the qualitative literature review, interviews and blog/forum review included joint pain, fatigue, joint stiffness, swelling (particularly in the extremities) and skin rashes. LN patients also reported urinary frequency, urgency, foamy urine and blood in their urine. Disease impact on physical functioning, activities of daily living, emotions, social life, work/finances and sleep were reported. PRO measures commonly used to evaluate patient experiences in LN included the SF-36, LupusQOL, LupusPRO, SLE Symptom Checklist, KDQoL and KSQ. Conceptual mapping of instruments against the newly developed conceptual model (Figure 1) highlighted that no single measure provides a comprehensive assessment of all symptoms/impact important to LN patients. Furthermore, items are largely focused on impact of symptoms with few items on symptom severity.

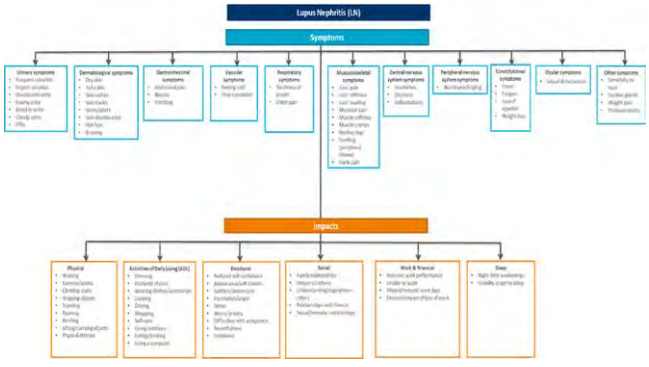

Figure 1. Conceptual model of lupus nephritis symptoms and associated impacts

Conclusion: The presentation of signs and symptoms in LN patients appears similar to those reported in extra-renal SLE populations, with the addition of swelling and urinary symptoms. Qualitative research with LN patients guided the development of a comprehensive LN conceptual model outlining the disease experience from the patients' perspective. These insights can be useful to inform PRO measurement strategies for clinical trials in LN.

AB1333-HPR FIBROMYALGIA SYNDROME IN MEDICAL STUDENTS

İ. Akcin[1], M. Gur[2], R. Piskin Sagir[2], B. Oz[2], A. Karatas[2], S. S. Koca[2]. [1]*Firat University, Elazig, Turkey*; [2]*Firat University, Rheumatology, Elazig, Turkey*

Background: At the university, students begin to be responsible for their own life decisions and lifestyles. First year students are required to adapt especially to a new learning environment and to cope with the academic and social demands of vocational education. High academic expectations are stressful and can pose a risk to students mental and physical health. Anxiety and depression are among the most common psychiatric problems among students.

Objectives: The aim of this study is to evaluate the prevalence of fibromyalgia syndrome (FMS) in medical students and to compare students from engineering faculty.

Methods: 392 (284 faculty of medicine, 108 faculty of engineering) students selected from Fırat University Faculty of Medicine and Engineering were included in the study. Hospital Anxiety and Depression Scale (HADS) forms were filled in for all participants. Anxiety and depression among students of medical and engineering were examined. Moreover, 2016 ACR FMS classification criteria was used to select the student who have FMS.

Results: In our sample, 185 (47.1%) and 207 (52.9%) of participants were male and female, respectively. HADS anxiety and HADS depression scores were significantly higher in engineering students than in medical students (mean HADS anxiety and depression scores were 9.07; 10.29, p= 0.007 and 7.61; 8.52, p= 0.039, respectively). While a significant difference was found among medical and engineering students in terms of HADS anxiety and depression scores in men ($p<0.001$ and p= 0.006), no significant difference was found in women (p= 0.676 and p= 0.278). On the other hand, 46 (16.1%) of medical students and 13 (11.7%) of students from engineering faculty have FMS (p=0.170).

Conclusion: FMS prevalences are similar in the medical students and students from engineering faculty. However, anxiety and depression are more common among male engineering students than medical students. This may be related to future employment anxiety among students from engineering faculty.

AB1334-HPR BARRIERS AND FACILITATORS TO PHYSICAL ACTIVITY IN JUVENILE IDIOPATHIC ARTHRITIS (JIA): A SCOPING REVIEW

K. O Donoghue[1], L. Larkin[2,3]. [1]*University of Limerick, Limerick, Ireland*; [2]*Health Research Institute, University of Limerick, Castletroy, Ireland*; [3]*University of Limerick, School of Allied Health, Faculty of Education & Health Sciences, Castletroy, Ireland*

Background: Physical activity is an important aspect in the management of JIA (1). However physical activity levels are low in this population (2). Limited research has been conducted to identify definitive barriers and facilitators to physical activity in children and adolescents who have JIA.

Objectives: The objective of this scoping review was to identify the common barriers and facilitators to physical activity in JIA.

Methods: Original studies, either quantitative or qualitative, including participants with a diagnosis of JIA, who were under 18 years of age were included. Two independent reviewers carried out a search of the literature and full text reviews of papers to determine eligibility for inclusion. The Critical Skills Appraisal Programme (CASP), Appraisal tool for Cross-Sectional Studies (AXIS) and Downs and Black critical appraisal tools were used to assess the quality of the included research articles.

Results: Eighteen studies were included in the review. The included studies were of a variety of low, moderate and high quality. The synthesis of the data identified pain to be the most common barrier and the modification of physical activities to the need of the individual to be the most common facilitator to physical activity in JIA.

Conclusion: Identifying the most common barriers and facilitators to physical activity allows clinicians to apply better management strategies when treating an individual with JIA. Our findings demonstrate the need for further research in this area to assist increasing physical activity participation for children and adolescents who have JIA.

AB1335-HPR HEALTH PROFESSIONALS' PERSPECTIVE ON THE BENEFITS AND RISKS OF LOW-DOSE GLUCOCORTICOIDS IN RHEUMATOID ARTHRITIS – AN INTERNATIONAL SURVEY OF 444 HEALTH PROFESSIONALS

T. Santiago[1,2], M. Voshaar[3], M. De Wit[4], P. Carvalho[5,6,7], M. Boers[8], M. Cutolo[9], F. Buttgereit[10], J. A. P. Da Silva[1,2]. [1]*Centro Hospitalar e Universitário de Coimbra, Rheumatology, Coimbra, Portugal*; [2]*University of Coimbra, Faculty of Medicine, Coimbra, Portugal*; [3]*University of Twente, Department of Psychology, Health and Technology, Enschede, Netherlands and Stichting Tools Patient Empowerment, Amsterdam, Netherlands*; [4]*Stichting Tools Patient Empowerment, Amsterdam, Netherlands*; [5]*Centro Hospitalar Universitário do Algarve, Rheumatology, Faro, Portugal*; [6]*Lisbon Academic Medical Centre, Lisbon, Portugal*; [7]*Algarve Biomedical Center, Faro, Portugal*; [8]*Department of Epidemiology and Biostatistics; and Amsterdam Rheumatology and Immunology Center, Amsterdam University Medical Centers, Vrije Universiteit, Amsterdam, Netherlands*; [9]*Research Laboratory and Academic Division of Clinical Rheumatology, Department of Internal Medicine, University of Genova, IRCCS Polyclinic Hospital San Martino, Genova, Italy*; [10]*Department of Rheumatology and Clinical Immunology, Charité University Medicine Berlin, Berlin, Germany*

Background: The Glucocorticoid Low-dose Outcome in Rheumatoid Arthritis Study (GLORIA) is an international investigator-initiated pragmatic randomized trial designed to study the effects of low-dose glucocorticoids (GCs) in elderly patients with Rheumatoid Arthritis (RA).

The research team is also committed to promote a better understanding of the risks and benefits of these drugs among health professionals and patients. In order to achieve these goals, it is important to assess the current ideas and concerns of patients regarding GCs.

Objectives: To evaluate the current patient perspective on the efficacy and risks of GCs in RA patients who are or have been treated with GCs.

Methods: Patients with RA completed an online survey (with 5 closed questions regarding efficacy and safety) presented in their native language. RA patients were recruited through a variety of patient organizations representing three continents. Patients were invited to participate through national patient organizations. In the USA, patients were also invited to participate through MediGuard.org. Participants were asked for their level of agreement on a 5-point Likert scale.

Results: 1344 RA patients with exposure to GCs, from Brazil, USA, UK, Portugal, Netherlands, Germany and 24 other countries** participated: 89% female, mean age (SD) 52 (14) years and mean disease duration 13 (11) years. The majority of participants (84%) had ≥10 years of education. The duration of GCs exposure was 1.6 (4.2) years. The majority of participants had read articles or pamphlets on the benefits or harms of GC therapy.

Regarding GCs efficacy (table 1), high levels of endorsement were found: about 2/3 of patients considered that GCs as very useful in their case, more than half considered that GCs were effective even at low doses, and agreed that GC improved RA symptoms within days.

Regarding safety (table 1), 1/3 of the participants reported having suffered some form of serious adverse events (AEs) due to GCs, and 9% perceived this as "life-threatening. Adverse events had a serious impact on quality of life, according to about 1/3 of the respondents.

Conclusion: Patients with RA exposed to GC report a strong conviction that GCs are very useful and effective for the treatment of their RA, even at low doses. This is accompanied by an important prevalence of serious AEs. Understanding the patient perspective can improve shared decision-making between patient and rheumatologist.

Funding statement: This project has received funding from the European Union's Horizon 2020 research and innovation programme under grant agreement No 634886.

AB1336-HPR NON-PHARMACOLOGIC TOPICS RELEVANT FOR CLINICAL RESEARCH IN RHEUMATIC DISEASES: THE PATIENT PERSPECTIVE

F. Ingegnoli[1,2], T. Schioppo[1,2], T. Ubiali[1], S. Ostuzzi[3], M. Buoli[2,4], V. Bollati[2,5], R. Caporali[1,2]. [1]*G Pini Hospital, Clinical Rheumatology Unit, Milan, Italy*; [2]*Università degli Studi di Milano, Milan, Italy*; [3]*ALOMAR Lombard Association for Rheumatic Diseases, Milan, Italy*; [4]*IRCCS Ca'Granda Policlinico, Milan, Italy*; [5]*EPIGET Lab, Milan, Italy*

Background: The research approach on Rheumatic diseases (RDs) is challenging and patient involvement as partners in medical research is an emerging force to obtain relevant information and to add unique skills, values and experiences to research. Despite growing interest in non-pharmacologic aspects of clinical research in RDs, the patients' perspective is currently poorly explored.
Objectives: To identify and rank the priorities for clinical research according to patients' perspective.
Methods: A structured face-to-face meeting between physicians and a patient representative was convened to list the non-pharmacologic topics relevant to RD patients. A cross-sectional no-profit on-line anonymous survey was devised to evaluate opinions of RD patients. They were asked to rate the following topics: food/nutrition, air pollution, smoking, work activity, social participation, physical activity, emotional well-being/stress, alternative medicine, and patient-physician relationship. Moreover, patients were asked to explain for which reason a topic was considered important (disease prevention, halting disease progression, symptoms control and disease cure). The survey was disseminated by ALOMAR (Lombard Association for Rheumatic Diseases) between June and October 2019.
Results: 200 rheumatic patients completed the survey: 130 inflammatory arthritis, 50 connective tissue diseases/vasculitis, and 20 among osteoarthritis, gout, condrocalcinosis, polymyalgia and primary fibromyalgia. Respondents were 178 female with median age of 50 years and median disease duration of 7 years. Among the nine topics identified, the one most rated by patients was the doctor-patient relationship; 188 (94%) of respondents considered this topic very or extremely important (see table below). In descending order, patients rated very or extremely important: psychological well-being/stress 185 (92.5%), physical activity 155 (77.5%), nutrition, eating habits and alcohol 150 (75%), alternative therapies 144 (72%), work activity 144 (72%), environmental pollution 134 (67%), social life 121 (60.5%) and cigarette smoke 119 (59.5%). The topics considered relevant was perceived to be able to influence disease symptoms. Regarding RD prevention, environmental pollution and cigarette smoking were considered the most important topics, while fewer patients believed that research on other topics could help to stop disease progression or to achieve disease healing.

Ranking	Topic	Not or quite important	Very or extremely important
1	Doctor-patient relationship, n (%)	12 (6.0)	188 (94.0)
2	Psychological well-being/stress, n (%)	15 (7.5)	185 (92.5)
3	Physical activity, n (%)	45 (22.5)	155 (77.5)
4	Nutrition/eating habits/alcohol, n (%)	50 (25.0)	150 (75.0)
5	Alternative therapies, n (%)	56 (28.0)	144 (72.0)
6	Work activity, n (%)	56 (28.0)	144 (72.0)
7	Environmental pollution, n (%)	66 (33.0)	134 (67.0)
8	Social life, n (%)	79 (39.5)	121 (60.5)
9	Cigarette smoke, n (%)	81 (40.5)	119 (59.5)

Conclusion: This survey highlights the relevance of several unmet needs. The holistic approach, in terms of medical consultation and psychological well-being, is considered the most important component able to influence disease perception. By capturing patient opinions on non-pharmacological topics for clinical research, this survey indicates that the active patient involvement is essential to design successful translational studies and improve clinical outcomes.
Acknowledgments: We thank the Lombard Association of Rheumatic Diseases (ALOMAR) for its contribution to plan and disseminate the survey and the group that sustain systemic sclerosis (GILS).

AB1337-HPR PATIENTS' EXPERIENCE OF INVOLVEMENT IN A RHEUMATOLOGY OUTPATIENT CLINIC

P. Toftegaard[1]. [1]*Svendborg, Rheumatology, Svendborg, Denmark*

Background: Involvement in own treatment and care is a wish from patients and a vision from politicians in Denmark. (1,2) In outpatient rheumatology patient involvement also leads to increased patient satisfaction, better quality of treatment and better utilization of resources in health care. (3,4,5) On the basis of this we ought to involve our patients at our Outpatient Clinic in Svendborg, but are we?
Objectives: To gain knowledge about how patients with rheumatoid arthritis experience involvement in treatment and care in the Rheumatology Outpatient Clinic, Svendborg.
Methods: An interview study of six patients with subsequent analysis based on Ricoeur. (6) Patient inclusion: patients with rheumatoid arthritis in remission by DAS28 for more than 2 years. The participants elected were 3 males and 3 female at the age of 30 – 78 visiting the clinic during Marts and April 2019. They were asked about their experience of involvement from time of diagnosis until present time.
Results: The study provided knowledge that patient involvement was new to the participants. This is also found in other literature about patient involvement. (7,8) All participants in this study felt involved in own care and treatment. The involvement was based on being seen and heard as persons with individual needs and not just as patients with arthritis. The way the participants experienced involvement showed that there are individual differences in how to provide the experience. In order to clarify what involvement meant for each patient, relationship with the health professional was necessary, as other studies also shows. (7,8) The relationship was conditioned by continuity, trust, care and mutual respect. For all the participants informed consent was equal to involvement. Disease activity or fear of this was the main reason for feeling involved this way. Literature describes the same: amongst other factors, the severity of the disease is significant for the patients desire to be involved. (7,8)
Conclusion: The participants experienced involvement in own care and treatment. The relation to the health professional was important providing this experience. All defined involvement as informed consent as it also is to many healthcare professionals. (9) All participants needed time to reflect on what

involvement meant as none of them had heard of it before. Patient involvement needs education of both patients and healthcare professionals to be taken further than informed consent.

Background: The Addressing Lupus Pillars for Health Advancement (ALPHA) Project is a global consensus initiative to identify, prioritize and address top barriers in lupus drug development, clinical care and access to care. The Lupus Foundation of America convenes ALPHA with Tufts Center for the Study of Drug Development and a Global Advisory Committee of lupus experts representing clinician-scientists, industry and patients.

Objectives: Collect global patient input to determine alignment with the lupus clinician-scientist community on prior published consensus of top lupus barriers.

Methods: A 23-question online Qualtrics survey was developed to identify challenges across lupus diagnosis, clinical care and research participation. The survey, available in English, Spanish, Korean and simplified Chinese, was fielded in November 2019 to people with lupus and caregivers of children <18 with lupus. SPSS 26 and SAS 9.4 were used for descriptive statistics and sub-analysis.

Results: Analysis included only consented responses with ≥ 68% survey completion (n=3,447) received across 83 countries. 95% were female with a mean age of 45. Respondents reported being White (57%), Black or of African descent (14%), Hispanic or Latino (18%) and Asian (10%). 65% resided in the US while 35% resided in countries outside of the US. 97% were people with lupus while 3% were caregivers to children <18 with lupus.

Highest ranked challenges were similar globally and across children and adults: medication side effects, lack of treatment options and high out-of-pocket costs. Managing side effects ranked significantly higher ($p<.05$) outside of the US (48%) compared to US (40%). 50% of caregivers reported managing side effects as the top challenge for children compared to 43% of adults ($p<.05$). Research participation was low (24%) and lower among children (16%). The top reason for not participating in a clinical trial was not being asked by their doctor.

Conclusion: This global survey revealed that medication side effects and lack of effective treatments are top challenges for people with lupus, including children. Most respondents were never asked by their doctors to participate in a clinical trial, which may explain difficulties in trial recruitment. These barriers are consistent with prior published barriers identified by the clinician-scientist community.

AB1339-HPR SAFETY AND ADHERENCE OF THE JAK INHIBITORS IN CLINICAL PRACTICE IN RHEUMATOID ARTHRITIS

C. Valero[1], A. Calvo Garcia[1], N. García Castañeda[1], A. Ortiz[1], I. Llorente[1], B. Varas[2], S. Castañeda[1], R. Garcia de Vicuna[1], E. Ramirez[1]on behalf of Rheumatology and Pharmacy Hospital De La PrincesaRheumatology Hospital Santa Cristina. [1]*Hospital De La Princesa, Madrid, Spain*; [2]*Hospital Santa Cristina, Madrid, Spain*

Background: The Janus Kinase (JAKi) inhibitors Baricitinib (BAR) and Tofacitinib (TOF) are indicated for moderate to severe active rheumatoid arthritis (RA). Data about safety, effectiveness in refractory patients and adherence in real clinical practice in our population are scarce.

Objectives: An evaluation of safety, adherence and reasons to consider suspension of JAKi in routine clinical practice.

Methods: Retrospective observational study of patients with RA treated with BAR and TOF according to usual clinical practice between September 2017 - December 2019. Data were collected from the electronic medical record and from the Dominion® Outpatient Drug Dispensing program.

Demographic, clinical, laboratory and treatment-related variables were collected, including reasons for discontinuing JAKi (inefficiency and toxicity). Adherence was calculated using the Compliance Questionnaire on Rheumatology (CQR-5), and the average possession ratio (RMP), which is defined as the number of days with treatment dispensed between the total days of the period analyzed, considering the adherent patient when RMP had a ≥ 0.8.

Laboratory abnormalities were defined according to normal limit values (NLV) and specifications of data sheet. A descriptive analysis was performed using proportions, medians and interquartile ranges (IQR) using the SPSS v.15 program.

Results: Thirty patients were included in treatment with BAR and nine with TOF. The median age was 62.9 (RIQ 49.9-74.4), 34 (87.2%) were women, 28 (71.2%) anti-CCP and 32 (82.1%) were rheumatoid factor positive, with erosive disease in 34 (87,2%) patients. In the previous treatment, 9 (23.1%) were naive to biological, 6 (15.4%) had received 1 biological, 18 (46.1%) 2 biologicals, and 6 (15.4%) ≥ 3 biologicals. The median treatment time was 8.4 months (RIQ 6.5-20.3) in BAR and 13.2 (RIQ 3.9-20.7) in TOF.

The reasons for consider suspension shown in Table 1.

Table 1. Treatment Discontinuation

	Initial DAS28 [median (IQR)]	Final DAS28 [median (IQR)]
BARICITINIB		
Continue treatment n (%): 17/30 (55.6)	4.20 (2.95-5.72)	2.60 (1.70-2.77)
Reasons for suspension		
-Refractory n (%): 7/13 (55.8%)	4.38 (4.16-5.43)	4,16 (3.56-5.23)
-Side effects n (%): 4/13 (30.7)	4.16 (3.45-4.84)	3.15 (2.69-4.41)
◦Thrombocytosis (1)		
◦Herpes Zoster (1)		
◦Anemia (1)		
◦Tubaritis (1)		
-Patient decisión n (%): 2/13 (15.4)		
TOFACITINIB		
Continue treatment n (%): 6/9 (66.6)	4.82 (3.28-6.20)	2.61 (2.45-3.70)
Reasons for suspension		
-Refractory n (%): 2/3 (66.6)	5.27 (5.23-5.31)	5.48 (5.04-5.92)
-Side effects n (%): 1/3 (33.33)		

Based on the CQR5 questionnaire, all patients treated with BAR and TOF were adherent "HIGH" class, and a median of RMP = 1.01 (IQR = 0.93-1.06) was obtained for BAR and RMP = 1, 00 (IQR = 0.91-1.01) for TOF, all adherents (≥ 0.8).

Table 2. Safety results of the treatment shows the safety results.

Side Effect	Baricitinib (n, %)	Tofacitinib (n, %)
Hb <11 g/dl	7 (23,3)	0
Hb < 8 g/dl	0 (0)	/
Hb Recovery >11 g/dl	2/7 (28,6)	/
Neutrophils < 1500/mm^3	0 (0)	/
Lymphocytes < 1000/mm^3	3 (10,0)	2 (22,2)
Platelets > 600 × 10^3/mm^3	1 (3,3)	0
AST o ALT > 1 NLV	4 (13.3)	0 (0)
Hypercholesterolemia (> 1 NLV)	13 (43.3)	5 (55.5)
Infections	13 (43.3)	0 (0)
Herpes zoster	6 (20,0)	0 (0)

Conclusion: In our population, mostly refractory to biological, more than half of the patients maintain treatment with JAKi, with optimal adherence. The main reason for the suspension of both drugs was inefficiency. The most frequent adverse effects were hypercholesterolemia in both groups and infections in BAR, with a high frequency of herpes zoster. No cardiovascular or thromboembolic events were observed.

AB1340-HPR PATIENTS' OUT-OF-POCKET EXPENSES ANALYSIS IN PATIENTS WITH RHEUMATOID ARTHRITIS ENROLLED IN A EDUCATIONAL PROGRAM

D. Buitrago-Garcia[1], F. Rodriguez[2], G. Sánchez[1], P. Santos-Moreno[3].
[1]Fundación Universitaria de Ciencias de la Salud, Epidemiology, Bogota, Colombia; *[2]Biomab - Center for Rheumatoid Arthritis, Patient Education Program, Bogota, Colombia*; *[3]Biomab - Center for Rheumatoid Arthritis, Rheumatology, Bogota, Colombia*

Background: The increasing health and economic burdens of deaths and disabilities from non-communicable diseases (NCDs) are emerging as major concerns worldwide, particularly for low- and middle-income countries (LMICs) (1). Rheumatoid arthritis (RA) NCD is considered as one of the most common causes of disability. RA affects from 0.5% to 1% of the worldwide population. Little is known about the out-of-pocket (OOP) expenditures for prescription of pharmacological treatment for patients with RA, including drugs, diagnostic tests, mobility aids among others.

Objectives: To describe the out of pocket costs in patients with rheumatoid arthritis

Methods: We performed a cross-sectional study among patients who are participating in an educational program in a specialized center for RA. We collected sociodemographic variables; in addition, we collected data related to the expenditures in drugs, diagnostic tests and mobility aids that were not covered by the health system. Descriptive epidemiology was done, we calculated means, and standard deviations for continuous variables and categorical variables were presented as rates. The costs are presented in the US dollars with the average exchange rate for 2019

Results: We included 181 patients, 92% were female. Mean age was 59 years ±9.5. Regarding occupation, 24% were employees, 40% were economically inactive, and 36% were pensioners. Most of patients 45% had a low income, 43 % middle income and only 12% high income according to the Colombian socioeconomic classification. Most of out of pocket expenses (47%) were associated to the acquisition of medical devices such as reading glasses or orthopedic braces. Secondly, the OOP expenses were related to medications (38%) such as antibiotics prednisone or pain control medications. Finally, 25% of patients reported that they had pay for their diagnostic tests such as x rays or laboratory tests. When assessed the costs patients expended between 30-100 USD purchasing aid devices, medications or laboratory tests.

Conclusion: In the Colombian context OPP are relevant and represent an important expenditure for patients with RA especially for those who have low or middle income. Due to the above, it is important to find alternatives in order to help vulnerable segments of the population. Additionally, OPP needed to be taken into account due to its association with treatment adherence(2).

AB1341-HPR FEASIBILITY OF THE BACK AND FORTH SCHOOL BOOKLET, A SHARED SELF MANAGEMENT INSTRUMENT FOR YOUNG CHILDREN WITH JUVENILE IDIOPATHIC ARTHRITIS (JIA) AT SCHOOL

J. Cappon[1], M. Van Rossum[1,2], E. Littooij[1], M. Van der Leeden[1,3]. *[1]Reade, Centre for Rehabilitation and Rheumatology, Amsterdam, Netherlands*; *[2]Amsterdam UMC, locatie AMC, Amsterdam, Netherlands*; *[3]Amsterdam UMC, locatie VUmc, Amsterdam, Netherlands*

Background: Young children with JIA have to cope with pain and fatigue during schooldays, facing problems with writing, climbing stairs, physical education and playing outside.[1] They need to develop age-appropriate self management skills, encouraged by their parents and teachers in a therapeutic alliance with the health professional team.[2] For this purpose a shared management tool, called the "Back and Forth Schoolbooklet"(B&FS), is developed, containing 1) Educational pages about JIA, pain and fatigue management 2) Diary pages with a colour-in puppet for expressing location and amount of pain, spaces for writing alternatives for limited activities, feedback spaces for parents and teachers and a self-evaluation scale of general well-being for the child. Children, parents and teachers are instructed how to use the booklet by therapists during outpatient rehabilitation. Structured evaluation of the use of the instrument is necessary to improve its applicability and effectiveness.

Objectives: To study the feasibility, defined as practical and experienced applicability and effectiveness, of the B&FS.

Methods: Pilot feasibility study with a mixed-method design. Parents, teachers, therapists and children with JIA were invited to fill in questionnaires after using the booklets in school. Adults had to sign informed consent. Practical applicability was assessed by multiple choice questions on duration and frequency of use. Used diary items and pages were counted in returned booklets. Experienced applicability and effectiveness were assessed by open-ended questions and 5 points Likert scales. Topics were experienced barriers, facilitators and benefits using the mentioned items of the booklets. Practical applicability was analysed descriptively. Atlas-ti8 was used for analysing and coding the answers on the open-ended questions using a thematic approach.

Results: Eight children(4-8 years) used the booklets. Six parents of six children, four therapists and four teachers signed informed consent and answered questionnaires. Six booklets were returned.

Practical applicability: Five children used booklets for a period of 2 to > 12 week, almost every day. One child stopped in the first week. Counting diary pages

confirmed every day or every second day appropriate use of the color-in puppet and spaces for parents and teachers. Experienced applicability: Identified themes were: child-friendly, easy and providing a clear guide for the daily school situation. Themes as: daily obligation, unwillingness of the child, lack of motivation or time of the parents or teachers and insufficient instruction illustrated experienced barriers for the use of the booklet. Effectiveness: Identified themes: 1) Children express themselves better about feelings of pain and fatigue, 2) Parents and teachers appreciate more insight into how the child feels and 3)Teachers feel provided with guidance in the interaction with the child 4) Children feel more secure to express itself at school and 4) Parents are more relaxed about the schoolsituation.

Likertscales showed that more than 75% of the users would advise the B&FS to other parents, teachers and therapists.

Conclusion: The Back & Forth School booklet is a feasible shared management instrument to support young children with JIA in the school situation. A less rigid daily routine and sufficient instruction can improve the experienced applicability.

AB1342-HPR RHEUMATOLOGY 'HOT CLINIC' IN A TEACHING HOSPITAL - WHAT CAN BE EXPECTED?

M. Chakravorty[1], J. Southern[1], L. H. Lee[2]. [1]*Royal Derby Hospital, Rheumatology, Derby, United Kingdom*; [1]*Royal Derby Hospital, Rheumatology, Derby, United Kingdom*

Background: Increased financial and bed pressures faced by the NHS have necessitated significant changes in the service provision of many inpatient medical specialties. At the Royal Derby Hospital, rheumatology has become predominantly outpatient-based and no longer has an allocated ward for inpatients. As a result, weekly rheumatology 'hot clinic' have been set up to help facilitate early hospital discharge and specialist outpatient review of patients with suspected rheumatological conditions. It was anticipated that the bulk of referrals would be for conditions requiring early intervention such as suspected giant cell arteritis (GCA) and hot swollen joints. However, there is a paucity of literature on the usefulness of such 'hot clinics' and the quality of referrals.

Objectives: This study sought to evaluate the range of conditions referred to the 'hot clinic' and early outcomes related to follow up or discharge.

Methods: The details of patients who attended the 'hot clinic' were retrospectively obtained using the hospital's electronic clinic appointments system. Electronic letters and discharge summaries were reviewed to determine the patient's presenting symptoms, suspected diagnosis and clinical outcome.

Results: A total of 40 patients who attended the 'hot clinic' from September 2018 to June 2019 were included. The average time from discharge to 'hot clinic' was 3.8 days (range 0-22 days). 27 patients (67.5%) were seen within 7 days of hospital discharge and 2 patients were seen after 18 and 22 days respectively, which spanned over the Christmas and New Year period.

87.5% (35) of patients were referred by acute medicine via the ambulatory care ward; 10% (4) by the Emergency Department and 1 by the medical ward. 5 patients were already known to rheumatology (3 with rheumatoid arthritis and 2 with psoriatic arthritis).

37.5% of referrals were made for suspected GCA, 35% for rash and possible connective tissue disease (CTD) or vasculitis except for GCA, 20% for swollen joints, and 7.5% for unexplained arthralgia or myalgia.

For the patients with suspected GCA, 3 out of 15 were treated as GCA after 'hot clinic' review - 2 of these went on to have a temporal artery biopsy and 1 had a positive biopsy for GCA. (All 3 received high dose steroids prior to their clinic appointment). 10 patients were felt to have an atypical headache and 3 of these were referred to neurology for further assessment. The remaining 2 patients were diagnosed with a sinus infection and migraine respectively.

Of the 14 patients referred with a rash and possible CTD or vasculitis except for GCA, 2 patients referred with a rash were diagnosed to have IgA vasculitis and referred to dermatology for further management. 2 patients were diagnosed with lupus and were followed up in the CTD clinic. 7 patients were felt to have a self-limiting post-viral or non-specific rash, 2 patients with possible drug-related rash and 1 patient thought to have erythema nodosum.

2 patients with swollen joints had a new diagnosis of seronegative inflammatory arthritis and 2 others were diagnosed with gout. 1 patient was diagnosed with osteoarthritis and another with post-viral arthritis and both were discharged.

The 3 patients with unexplained arthralgia or myalgia were felt to have self-limiting post-viral illnesses and were also discharged.

Conclusion: Suspected GCA is the most common referral to the rheumatology 'hot clinic'. However, the vast majority of these referrals turned out not to be GCA. The results of this study clearly suggest the need for development of better pathways e.g. for GCA and joint dermatology and rheumatology clinics.

AB1343-HPR A QUALITATIVE REVIEW ASSESSING THEMATIC OUTCOMES FROM THE PHARMACY-LED ADALIMUMAB BIOSIMILAR SWITCH PLAN ACROSS 3 SPECIALITIES; RHEUMATOLOGY, GASTROENTEROLOGY AND DERMATOLOGY AT UNIVERSITY HOSPITALS OF COVENTRY AND WARWICKSHIRE (UHCW)

S. Gohil[1]. [1]*University Hospitals of Coventry and Warwickshire, Pharmacy, Coventry, United Kingdom*

Background: The advent of biosimilars has heralded a new era for cost effective biologic prescribing in the NHS. As patents expire for originator biologics, less expensive versions are now widely available as biosimilars. Non-medical switches (for reasons unrelated to a patient's health) ensure prescribing of best value medicines, and cost savings can be redirected to patient care.[1] This practice resonates with recommendations from Lord Carter's 2016 report regarding reducing unwarranted variation in the NHS and adopting cost saving opportunities.[2] In 2018/19, following loss of patent exclusivity for the expensive adalimumab originator biologic, UHCW worked in accordance with national directives to drive forward one of the largest non-medical biosimilar switches.

Objectives: This qualitative review aims to explore the success of the adalimumab biosimilar switch and key themes associated with switch backs/refusals across the Rheumatology (R), Gastroenterology (G) and Dermatology (D) specialities at UHCW.

Methods: The switch plan occurred between April-December 2019. 403 patients (R;189, G;176, D; 38) were eligible for switch. Patients were informed of the plan in advance via a patient information leaflet/hospital clinic visits. Switch refusals, withheld treatments and cancellations were documented and patients were advised to contact the hospital pharmacy/clinical teams if they encountered any concerns, adverse effects or lack of efficacy post switch. The clinician would then advise on subsequent management.

Results: During April-December 2019, 264/403 patients had been successfully switched (R;122, G;109, D;33). 33/403 patients switched back to the originator biologic (R;22, G;10; D;1). Of the 22 rheumatology switch back patients; 6 patients reported injection site pain and variably headache, fatigue, disease relapse, gastrointestinal (GI) upset, erythema; 10=reported lack of efficacy and variably influenza-type symptoms, relapse in associated psoriasis, difficulty in walking/sleeping, hair loss, excessive perspiration, facial cellulitis, foot drop and GI upset; 1=blepharitis;1=latex allergy before injection; 3=later declined switch; 1=damaged two devices and did not wish to continue biosimilar. Of the 10 gastroenterology switch back patients; 1=injection site pain; 2=lack of efficacy; 1=developed needle phobia; 1=latex allergy before injection; 1=switch detrimental to health; 2=unstable disease; 1=insomnia; 1=pregnancy. The 1 dermatology switch back patient reported injection site pain and bleeding.

38/403 patients refused the switch and remained on the originator biologic (R;11, G;27, D;0). 29/403 patients had treatment cancellations and were switched to an alternative biologic (R;17, G;9, D;3). 32/403 patients stopped treatment (R;13, G;19, D;0). Treatment was withheld for 7/403 patients (R;4, G;2, D;1).

Conclusion: The UHCW adalimumab biosimilar switch plan succeeded in switching a total of 66% of patients; thus an annual cost saving of £73,020. Injection site pain, most likely due to the biosimilar citrate content, and lack of efficacy according to patient perception and subsequent clinical review, were the most predominant causative themes for switch backs. Gastroenterology patients accounted for 71% (27/38) of the total switch refusals. Additional data regarding patient refusals, identifies future opportunities to improve patient counselling and drive further cost savings.

AB1344-HPR POOLED ANALYSIS OF ASSOCIATION BETWEEN ABATACEPT OR OTHER TARGET DISEASE-MODIFYING ANTI-RHEUMATIC DRUGS (TDMARD) AND TYPE 2 DIABETES MELLITUS (T2DM)-RELATED HEALTHCARE RESOURCE UTILIZATION (HCRU) AND COSTS IN TNFI-NAÏVE RHEUMATOID ARTHRITIS (RA) PATIENTS WITH T2DM

X. Han[1], Q. Xia[1], Y. Bao[1], V. Patel[1], A. Roy[2], V. Rajagopalan[2], F. Lobo[1]. *[1]Bristol-Myers Squibb, Princeton, United States of America*; *[2]Mu-Sigma, Bangalore, India*

Background: Limited information is available on the impact of target disease-modifying anti-rheumatic drugs (tDMARD) on patients with rheumatoid arthritis (RA) and type 2 diabetes mellitus (T2DM).

Objectives: The objective was to compare T2DM-related healthcare resource utilization (HCRU) and cost for TNF inhibitors (TNFi)-naive patients pooled from two commercial databases with RA and T2DM receiving abatacept, other non-TNFi, or TNFi.

Methods: A retrospective, observational study was conducted with MarketScan and PharMetrics (January 2008-September 2018). The study population included TNFi-naïve adult patients with RA and T2DM newly initiating abatacept, TNFi (adalimumab, certolizumab pegol, etanercept, golimumab, infliximab) or other non-TNFi (tocilizumab, anakinra, sarilumab, rituximab, tofacitinib). Date of tDMARD initiation was the index date. Patients had ≥2 RA diagnoses separated by ≥7 days, ≥1 T2DM diagnosis, and had ≥12 months of pre-index continuous enrollment. Follow-up ended at the end of patient insurance enrollment, study period or index treatment. T2DM-related HCRU and costs including inpatient stay, outpatient visits, ER visits, and pharmacy use were measured on a per-patient-per-month (PPPM) basis (2018 USD). Patients treated with abatacept were matched to TNFi and non-TNFi cohorts separately by propensity score adjusted with patients baseline comorbidities, HCRU, and costs.

Results: A total of 16,236 patients meeting criteria were identified. Most patients were female (74.3%), and the overall average age of 55.4 years (Table 1). After matching, 850 pairs of abatacept vs non-TNFi patients, and 1,096 pairs of abatacept vs TNFi patients were included in the adjusted results. Patients initiating abatacept had $144 lower adjusted T2DM-related costs as compared to non-TNFi and $79 lower costs than TNFi cohorts (Table 2).

Table 1. Patient Characteristics

	Abatacept n=1,134	Non-TNFi n=1,353	TNFi n=13,749	Total N=16,236
Age, mean years (SD)	58.5 (11.3)	57.7 (11.2)	54.9 (10.6)	55.41 (10.7)
Gender, female, n (%)	936 (82.5)	993 (73.4)	10,142 (73.8)	12,071 (74.3)
CCI, mean (SD)	2.2 (1.4)	2.3 (1.4)	1.8 (1.1)	1.89 (1.14)
DCSI, n (%)				
Cardiovascular	361 (31.8)	406 (30.0)	2,500 (18.2)	3,267 (20.1)
Neuropathy	294 (25.9)	374 (27.6)	3,161 (23.0)	3,829 (23.6)
Nephropathy	146 (12.9)	193 (14.3)	1,151 (8.4)	1,490 (9.2)
PVD	131 (11.6)	155 (11.5)	874 (6.4)	1,160 (7.1)
Retinopathy	103 (9.1)	119 (8.8)	922 (6.7)	1,144 (7.0)
Cerebrovascular	74 (6.5)	102 (7.5)	620 (4.5)	796 (4.9)
Metabolic	9 (0.8)	20 (1.5)	141 (1.0)	170 (1.0)

CCI: Charlson comorbidity index; DCSI: diabetes complications severity index; PVD: peripheral vascular disease.

Table 2. Adjusted T2DM-related HCRU and Costs after Propensity Score Matching

	Abatacept n=850	Non-TNFi n=850	Diff (ABA-Non-TNF)	Abatacept n=1,096	TNFi n=1,096	Diff (ABA-TNF)
T2DM-related HCRU (per 1000 Patients per Month)						
Number of Hospitalizations	13.9	20.4	-6.5*	12.6	14.9	-2.3*
Number of ER Visits	22.0	16.1	5.9*	18.4	16.3	2.0*
Number of Outpatient Visits	311	334.8	-23.7*	299.3	286.9	12.4
T2DM-related Costs (PPPM $)						
Inpatient Costs	507	535	-28	413	475	-62
ER Costs	27	17	10*	22	25	-3
Outpatient Costs	190	323	-133	186	170	16*
Pharmacy Costs	107	100	7*	97	128	-31
Total Costs	831	975	-144	719	798	-79*

*P<0.05

Conclusion: TNFi-naive RA patients with T2DM newly initiating abatacept had lower adjusted rates of T2DM-related hospitalizations compared to patients who initiated a non-TNFi or a TNFi. Total costs were lower among patients initiating abatacept vs. patients who initiated a non-TNFi or a TNFi. Findings suggest that initial abatacept among TNFi-naïve patients may be able to reduce healthcare utilization arising from T2DM complications and reduce T2DM-related costs in RA patients.

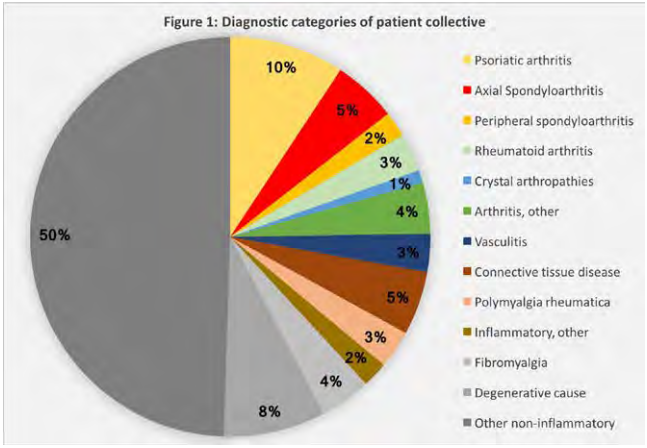
AB1345-HPR THE MULTIDISCIPLINARY FOOT CLINIC: A SERVICE EVALUATION PROJECT

G. Jevons[1], H. Edginton[1], G. Mccall[1], A. Pillai[1], S. Haque[1]. *[1]Manchester University NHS Foundation Trust, Southmoor Road, United Kingdom*

Background: Patients with rheumatological foot disease are an overlooked population, and it was noted locally that these patients received a fragmented service; attending multiple appointments for the management of one clinical issue. This led to delays in treatment; significant inter-departmental correspondence and variations in the peri-operative management of disease modifying anti-rheumatic drug (DMARD) and biologic therapies. To remedy this a foot multidisciplinary (MDT) clinic was established, including input from rheumatology, orthopaedic surgery, specialist rheumatology podiatry and physiotherapy. The outcomes from the foot MDT clinic have been analysed in this service evaluation project.

Objectives: To evaluate the outcomes of the multidisciplinary foot MDT clinic, with particular reference to concordance to the British Rheumatology Society (BSR) guidelines on peri-operative medicine guidelines.

Methods: Data was collected retrospectively across all clinics from January 2017 to February 2019. Clinic letters were obtained, and data was collected using a standardised data collection sheet. Data was collected on patient demographics, rheumatological diagnoses, treatment outcomes from the foot MDT,



appropriateness of peri-operative plan and post-operative complications. No data was available on these outcomes prior to the advent of the foot MDT clinic.
Results: Data from 12 clinics was analysed (n=40). Patients had a median age of 66 years (IQR 27.5 years); 65% of patients were female and 35% of patients were male. The commonest rheumatological foot disease seen was rheumatoid arthritis (67%), followed by psoriatic arthritis (15%). All patients were treated with biologic or non-biologic DMARDs. Treatment outcomes were as follows: 27.5% were offered surgical treatment; 10% were offered intra-articular (IA) injections under ultrasound guidance; 10% were offered IA injections under general anaesthetic; 25% underwent specialist rheumatology podiatry, and the remaining 30% elected for a conservative approach after careful consideration of treatment options. Of those who were offered surgical treatment, 72% of patients were provided with a peri-operative plan which accorded with British Rheumatology Society (BSR) guidelines. Of those whom underwent surgery, one patient's surgical treatment was complicated by a post-operative infection; however, the peri-operative DMARD/biologic plan was not felt to be contributing factor.
Conclusion: The foot MDT clinic provides a comprehensive review of rheumatological foot conditions, with readily available access to a full range of treatment options. Co-location of all relevant professionals allows for real-time interdepartmental communication; shared decision making between clinicians and patients; avoids multiple appointments; reduces uncertainty with peri-operative planning as well as providing a cost-effective and efficacious service. Discrepancies in the peri-operative plan for medicines arose when the treating orthopaedic surgeon was not present in clinic. In these cases, the plan for surgical treatment was made outside of this clinic, without input from the treating rheumatologist. To improve concordance with BSR peri-operative medicine guidelines, it is recommended that all treatment decisions are made during the clinic, allowing input from all relevant partners. Informal feedback from patients commended the foot MDT, this shall be formalised through further qualitative data.

AB1346-HPR

REAL-WORLD EFFECTIVENESS AND PERCEIVED USEFULNESS OF SYMPTOM CHECKERS IN RHEUMATOLOGY: INTERIM REPORT FROM THE PROSPECTIVE MULTICENTER BETTER STUDY

J. Knitza[1], J. Mohn[1], C. Bergmann[1], E. Kampylafka[1], M. Hagen[1], D. Bohr[1], E. Araujo[1], M. Englbrecht[2], D. Simon[1], A. Kleyer[1], T. Meinderink[1], W. Vorbrüggen[3], C. B. Von der Decken[4,5], S. Kleinert[6], A. Ramming[1], J. Distler[1], P. Bartz-Bazzanella[5], G. Schett[1], A. Hueber[1,7], M. Welcker[8]. [1]*Department of Internal Medicine 3 – Rheumatology and Immunology, Universitätsklinikum Erlangen, Friedrich-Alexander-University Erlangen-Nürnberg (FAU), Erlangen, Germany*; [2]*Freelance Healthcare Data Scientist, Eckental, Germany*; [3]*Verein zur Förderung der Rheumatologie e.V., Würselen, Germany*; [4]*MVZ Stolberg, Stolberg, Germany*; [5]*Klinik für Internistische Rheumatologie, Rhein-Maas Klinikum, Würselen, Germany*; [6]*Rheumatologische Schwerpunktpraxis, Drs. Kleinert, Rapp, Ronneberger, Schuch u. Wendler, Rheumatology, Erlangen, Germany*; [7]*Sektion Rheumatologie, Sozialstiftung Bamberg, Klinikum Bamberg, Bamberg, Germany*; [8]*MVZ für Rheumatologie Dr. Martin Welcker GmbH & RheumaDatenRhePort (rhadar), Planegg, Germany*

Background: Symptom checkers (SC) promise to reduce diagnostic delay, misdiagnosis and effectively guide patients through healthcare systems. They are increasingly used, however little evidence exists about their real-life effectiveness.
Objectives: The aim of this study was to evaluate the diagnostic accuracy, usage time, usability and perceived usefulness of two promising SC, ADA (www.ada.com) and Rheport (www.rheport.de). Furthermore, symptom duration and previous symptom checking was recorded.
Methods: Cross-sectional interim clinical data from the first of three recruiting centers from the prospective, real-world, multicenter bETTeR-study (DKRS DRKS00017642) was used. Patients newly presenting to a secondary rheumatology outpatient clinic between September and December 2019 completed the ADA and Rheport SC. The time and answers were recorded and compared to the patient's actual diagnosis. ADA provides up to 5 disease suggestions, Rheport calculates a risk score for rheumatic musculoskeletal diseases (RMDs) (≥1=RMD). For both SC the sensitivity, specificity was calculated regarding RMDs. Furthermore, patients completed a survey evaluating the SC usability using the system usability scale (SUS), perceived usefulness, previous symptom checking and symptom duration.
Results: Of the 129 consecutive patients approached, 97 agreed to participate. 38% (37/97) of the presenting patients presented with an RMD (Figure 1). Mean symptom duration was 146 weeks and a mean number of 10 physician contacts occurred previously, to evaluate current symptoms. 56% (54/96) had previously checked their symptoms on the internet using search engines, spending a mean of 6 hours. Rheport showed a sensitivity of 49% (18/37) and specificity of 58% (35/60) concerning RMDs. ADA's top 1 and top 5 disease suggestions concerning RMD showed a sensitivity of 43% (16/37) and 54% (20/37) and a specificity of 58% (35/60) and 52% (31/60), respectively. ADA listed the correct diagnosis of the patients with RMDs first or within the first 5 disease suggestions in 19% (7/37) and 30% (11/37), respectively. The average perceived usefulness for checking symptoms using ADA, internet search engines and Rheport was 3.0, 3.5 and 3.1 on a visual analog scale from 1-5 (5=very useful). 61% (59/96) and 64% (61/96) would recommend using ADA and Rheport, respectively. The mean SUS score of ADA and Rheport was 72/100 and 73/100. The mean usage time for ADA and Rheport was 8 and 9 minutes, respectively.
Conclusion: This is the first prospective, real-world, multicenter study evaluating the diagnostic accuracy and other features of two currently used SC in rheumatology. These interim results suggest that diagnostic accuracy is limited, however SC are well accepted among patients and in some cases, correct diagnosis can be provided out of the pocket within few minutes, saving valuable time.

AB1347-HPR

DIGITAL SOLUTIONS TO AID SELF-MANAGEMENT: DEVELOPING A RHEUMATOLOGY APP FOR USE BY ANY PATIENT ATTENDING OUR DEPARTMENT

K. Mackay[1], H. Kelly[2], M. Clemence[1], R. Penford[1]. [1]*Torbay and South Devon NHS Foundation Trust, Torquay, United Kingdom*; [2]*Torbay Hospital, Torquay, United Kingdom*

Background: Managing complex rheumatological conditions requires information about the disease itself, treatments regimes and side effects. This is particularly important for those with a new diagnosis.

A local patient focus group identified the need for trustworthy information, written and reviewed by their rheumatology team to aid self-management. They felt information should be readily accessible, in one place, to re-read / re-listen to, as required.
Objectives: To develop a Rheumatology App, for any patient attending our department, to support self-management.
Methods: We worked with a number of rheumatology patients, of differing ages, the Rheumatology multi-disciplinary team (MDT) and an industry partner, hci.digital, to develop our App, called 'Rheumatology Connect'.
We developed over 30 short videos, provided links to other valuable patient websites e.g. Versus Arthritis, NRAS, NASS, and wrote short articles, to provide basic headline information about various different diseases, common treatments e.g. Methotrexate. We provided easily accessible contact details and information about our clinic locations (including postcodes, bus links, car parking). Video content was written by the clinical authors and filmed by hci.digital.
Patient involvement in designing the layout was particularly important for the App to be easily navigable by all.
We launched the App, in June 2018, at a local patient educational conference. We encourage all patients on regular follow up to download it /use it and remind everyone about it in our clinic letters.
Results: Downloads have been ongoing since launch, with over 1953 downloads and 21930 page views, with peaks around the time of our monthly education sessions when we advertise the App to new patients.
Over 54% spent between 2 to 5+ minutes in the App at a time. Most of the videos in the App are about 2 minutes long. Common hits include: videos on medications, various conditions, contact details, clinic locations, and services available.
We have had a number of spontaneous contacts from patients saying how valuable they find the information we have given them.
The App aids efficiency by allowing direct phone calls to the correct member of the MDT e.g. rheumatology physio, rather than going through the secretaries. We are also encouraging direct email contact via the App. These aspects are helping us make our services more efficient.
Conclusion: The App continues to be downloaded and used by our patients. It has become an important part of our patient education efforts, especially for those with a new diagnosis.
We have had a significant increase in email contact from patients, allowing us to be more efficient by responding more quickly to patient queries, avoid additional telephone calls and avoid ansa-phone messages.
To date, the App continues to be downloaded by patients and we have received very positive feedback. Having surveyed the users, our next step is to develop interactive PROMS, a calendar reminder function and medicines management function as these have been identified as additions users would find helpful to manage their disease. We have raised funds to develop the App. The updated app should be available by May 2020
Download free from App store (search '***Rheumatology Connect***') or go to ***www.rheumatologyconnect.info***.

AB1348-HPR TELEMEDICINE IN RHEUMATOLOGY: ACCEPTANCE BY PATIENTS AND MEDICAL PRACTITIONERS IN GERMANY (TELERHEUMABB) - INTERIM ANALYSIS

F. Muehlensiepen[1,2,3], W. Marquardt[2], J. Knitza[4], A. Hueber[5], M. Welcker[6,7]. [1]*Medizinische Hochschule Brandenburg Theodor Fontane, Zentrum für Versorgungsforschung, Neuruppin, Germany*; [2]*KV Consult- und Managementgesellschaft mbH, Potsdam, Germany*; [3]*Witten/Herdecke University, Witten, Germany*; [4]*Friedrich-Alexander University of Erlangen-Nürnberg, University Hospital Erlangen, Department of Internal Medicine 3 - Rheumatology and Immunology, Erlangen, Germany*; [5]*Sozialstiftung Bamberg, Sektion Rheumatologie, Bamberg, Germany*; [6]*MVZ for RHEUMATOLOGY Dr. Martin Welcker GmbH, Planegg, Germany*; [7]*RheumaDatenRhePort (rhadar), Planegg, Germany*

Background: The number of rheumatologists in Germany does not cover the minimum medical need [1]. This implies long journeys and waiting periods for patients in the context of rheumatologists' consultations. International studies suggest that telemedicine could resolve these issues and support health care professionals in rheumatologic care [2, 3]. So far, comprehensive sustainable approaches are still pending in Germany. By addressing the potential users, TeleRheumaBB investigates whether and how telemedicine can support rheumatologic care in Germany. The study is realized from Oct. 2017 until Jun. 2020.
Objectives: The objectives of the study are to evaluate the acceptance and willingness of patients and medical practitioners (MP) to implement telemedicine into rheumatological care as well as to understand how telemedical approaches should be designed to be applied in daily practice.
Methods: The study design contains a mixed-methods approach, which combines qualitative and quantitative data. In the qualitative part of the study 28 in-depth interviews and 3 focus groups involving patients, rheumatologists, general practitioners and stakeholders were conducted. The quantitative part of the study comprised a questionnaire survey with rheumatologists (n=48) and referrers (n=444) and a second questionnaire survey with patients (n=734).
Results:
Qualitative Data: The term "telemedicine" is filled with different meanings. Motives to implement telemedicine into daily practice are patient guidance, information, substantial time savings, desire of a modern practice etc. Reported risks of telemedicine are adverse impacts on the doctor-patient-relationship as well as low benefit with high effort.
Quantitative Data: 62% of the MPs' surveyed answered that they would like to use telemedical approaches. 81% of the participants supported doctor-doctor communication via telemedicine. Only 47% of the MPs' surveyed supported doctor-patients communication via telemedicine. MPs' state that there are barriers which prevent them from implementing telemedicine (89%). These are among others acquisition of technology, administrative expenses and poor remuneration. 53% of the patients surveyed stated that they had heard the term telemedicine before. 30% of the participants answered that they would like to try out telemedicine. 38% answered with "no" and 29% with "do not know". Further results from the patient survey will be available in June 2020.
Conclusion: The study results show high acceptance rates of telemedicine regarding doctor-doctor communication. Doctor-patient communication via telemedicine is less accepted. However, MPs' are reporting obstacles preventing the implementation of telemedicine in rheumatology. In order to implement telemedicine in rheumatological care comprehensively, adequate conditions must be established in the German health care system.

AB1349-HPR IMPLEMENTATION OF A GROUP EDUCATION SERVICE FOR RHEUMATOLOGY OUTPATIENTS COMMENCING BIOLOGIC THERAPY AT UNIVERSITY COLLEGE LONDON HOSPITAL (UCLH)

M. Naja[1], E. Hawkins[1], S. Moore[1], M. Castelino[1]. [1]*University College London Hospital, Rheumatology, London, United Kingdom*

Background: Biologic therapies are commonly prescribed in a range of rheumatic conditions. From 2016 - 2018, a mean of 226 rheumatology outpatients at UCLH commenced biologic therapy per year for inflammatory arthritis alone[1]. Patient education is required prior to initiation. At UCLH this is delivered via individual appointments with specialist nurses, contributing to waiting times for nurse appointments and thus delays in starting treatment.
Objectives:
1.To evaluate patient satisfaction following group education.
2.To reduce the burden on specialist nurses delivering multiple individual sessions.
Methods: A once-weekly group education service was set up at UCLH. This comprised: an oral PowerPoint presentation; injection demonstration; question and answer session; and written leaflets. Patients were provided with pre- and post-session questionnaires to evaluate the service.
Results: Over the first five weeks of the service, 18 patients attended group education (a median of 4 patients per session). Nine patients (50%) had previously researched the medication via internet search engines. Patients' questions prior to the session were most commonly centred on side effects and long-term risks. All of the patients (100%) felt that "most or all" of their questions were answered during the session. Patients gave their awareness of the reason for therapy a median score of 7/10 pre-education; this rose to a median of 10/10 post-education. The median score given for confidence to self-administer the drug was

5.5/10 pre-education; this rose to a median of 10/10 post-education. The median anxiety score was 3/5 pre-education; this dropped to 2/5 post-education. The presentation was adapted based on questions that arose during the sessions. Multiple patients gave informal, verbal feedback stating that they found the group environment to be beneficial, providing a chance to meet others with similar conditions, share experiences and feel reassured that they are not alone in starting biologic therapy.

Conclusion: Patient feedback demonstrated that the group education sessions at UCLH were effective in improving their understanding of the rationale for biologic treatment, increasing their confidence in self-administration, and reducing anxiety. Verbal feedback illustrated that many patients enjoyed the group environment, and the opportunity to interact and share experiences with others. At an average rate of 4 patients currently being seen a week, it is estimated that this will save 192 specialist nurse appointments per year (out of an estimated 226 commencing biologic therapy). There is scope for further research into the effects that this has had on waiting times to receive education / start treatment, and on drug compliance.

AB1350-HPR SOCIOECONOMIC BURDEN OF NON-ATTENDANCE IN RHEUMATOLOGY CONSULTATION

J. Rodrigues[1], D. Faria[1], J. Silva[1], S. Azevedo[1], F. Guimarães[1], D. Almeida[1], C. Afonso[1], S. Alcino[1], D. Peixoto[1], F. Teixeira[1], J. Tavares-Costa[1]. [1]*ULSAM, Rheumatology, Ponte de Lima, Portugal*

Background: Outpatient non-attendance refers to the phenomenon of patients who have a medical appointment but do not show up at the specified date, time, and location without giving previous notice.[1] In addition to affecting the efficiency and thereby increasing the healthcare total costs, nonattendance might also delay access to care for users on waiting lists.[1] Nonattendance at health appointments is costly to services, and can risk patient health.[2] There is very little data on the nonattendance prevalence and impact in Portugal. This knowledge might be fundamental to improve effectiveness of outpatient care in Portugal.

Objectives: 1) describe patient's non-attendance rate; 2) assess and characterize the sociodemographic and clinical characteristics among non-attending patients; 3) estimate the economic burden of non-attendance.

Methods: Retrospective, cross-sectional and analytical study. We reviewed a one-month Rheumatology consultation period regarding performed medical consultations and non-attended consultations without previous notification from patients. Direct economic costs of non-attended appointments were calculated based on the "Amending Agreement to the ULSAM, EPE Program Agreement."

Results: 982 consultations within January 2018 were included. Appointments episodes for therapeutic prescription, medical reports or programmed admissions were excluded. Fifty-seven (5.8%) of scheduled outpatient appointments were non-attended. Subsequent consultations represented 85.2% of attended appointments and 80.7% of non-attended appointments. Female gender was the most prevalent in both groups – 620 (67.0%) among attended consultations and 37 (65.0%) among non-attended consultations. Mean age was 57±15 years in the first group and 54±16 years in the second one. Among attended appointments, mean education level was 8±5 years versus 9±6 years among non-attended appointments. There were no differences between both groups in gender, age, education level, diagnosis, disease duration and activity or appointment type (first or subsequent consultation). A cost of 2,438 euros was estimated regarding non-attended appointments for this period, what could represent a burden of more than 29,000 euros yearly, in direct costs, only.

Conclusion: Non-attendance at scheduled appointments in public hospitals seems to be influenced by other factors besides gender, age and education level. The burden of non-attended appointments is undeniable. In addition to the costs estimated in this study, further indirect costs such as poorer patients outcomes, impaired access to medical care and hospital penalties should be taken into account. Implementation of awareness strategies aiming the optimization and effectiveness of healthcare system are required.

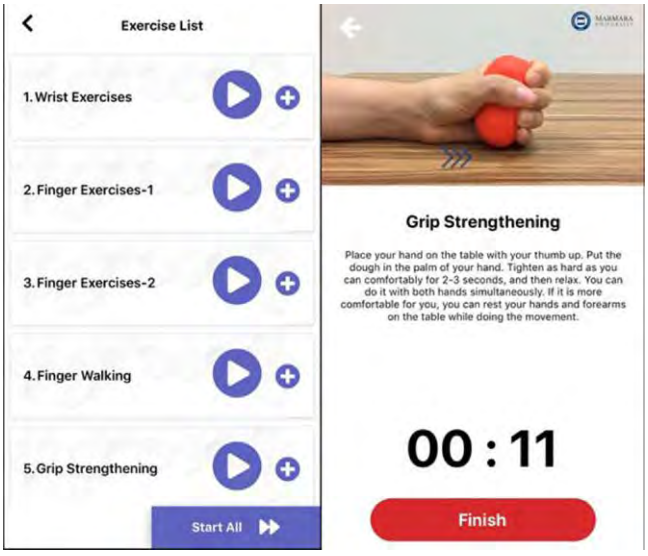
AB1351-HPR A HAND EXERCISES MHEALTH APP FOR PATIENTS WITH RHEUMATOID ARTHRITIS: DEVELOPMENT, DESIGN AND USABILITY STUDY IN TURKEY



E. Tonga[1], C. Srikesavan[2], E. Williamson[2], S. Lamb[2]. [1]*Marmara University, Faculty of Health Sciences, Department of Physiotherapy, Istanbul, Turkey*; [2]*University of Oxford, Nuffield Department of Rheumatology, Orthopaedics and Musculoskeletal Sciences, Botnar Research Center, Oxford, United Kingdom*

Background: The Strengthening and Stretching for Rheumatoid Arthritis of the Hand (SARAH) programme has been shown to provide long term improvement in hand function for patients with rheumatoid arthritis (RA) affecting their hands. In Turkey, limited number of physiotherapists work in rheumatology departments so there is an opportunity to use the digital technologies for exercise prescription and follow up to improve access to treatment.Growing research evidence supports the effectiveness of mHealth interventions for improving exercise adherence and motivation.To our knowledge,there is no hand exercises mHealth program for patients with rheumatoid arthritis designed by experts with the user-centered method.

Objectives: The aim of our study is to develop and design a smartphone application for structured hand exercise program for patients with RA in Turkey and to test its usability.

Methods: We used a qualitative user-centered design approach with 2 phases. PHASE 1:we conducted focus group meetings to discuss the content, feature and design of app to produce a prototype version of smartphone software for RA hand training program.The Focus Group consisted of two physiotherapists and three hand therapists working in the field in different rheumatology or hand rehabilitation clinics,two software-computer engineers, and three patients with RA who had previously participated in hand therapy. The focus group met 4 times during phase 1. PHASE 2:we investigated the usability of prototype version of the rheumatoid hand exercise smartphone app software. All focus group members (n=10) and 6 patients used the app for one week.All users filled the usability questionnaire and provided written feedback on the app. Revisions were made and the revised version was tested. We put the revised app in digital markets in Turkish and English.

Results: The major themes identified from the Focus Group discussions during phase 1 were (a)Login techniques (b)self-monitoring (c)exercises types/frequency/diary, (d) patient education, (e)behavioral change and encouragement (f)exercise adherence. Patients and therapist all agreed the login needed to be easy. Patients wanted to be able to monitor their pain levels and hand function in the app. Patients thought the SARAH exercise were suitable for the app. A patient said:*'SARAH exercises is beneficial for my hand and tendon gliding exercise,I will be happy to see these exercises in app'*. Patients wanted exercise reminders using push up notifications to encourage exercise were proposed and included.A patient commented 'in the *morning and after work, motivational push up messages could be beneficial for exercise habit*."During the phase 2,we identified a need for education on how to use digital app, ways to provide patient follow up to monitor adherence, the need to allow patients to select the amount of notifications. This feedback was incorporated into the final version.

Conclusion: mHealth applications represent an easily accessible bridge between patients and health professionals for home-based programs. Using a user-centered approach ensured that we developed an application that met the needs of therapists and patients. Physiotherapists are using the app in rheumatology clinics in Turkey and long-term usability and feasibility studies are ongoing.

AB1352-HPR **SHARED CARE – AN ALTERNATIVE WAY TO COPE WITH INCREASING SERVICE DEMAND**

C. Yin Shuen[1], N. Woon Leung2, L. Man Chi2, L. Chi Kwai2, C. Ching Man2, S. P. Kong2, L. Pik Fan2, C. L. Leung2. *[1]United Christian Hospital, Medicine and Geriatric, Hong Kong, Hong Kong (SAR)*; *[1]United Christian Hospital, Medicine and Geriatric, Hong Kong, Hong Kong (SAR)*

Background: Rheumatic diseases are immune-mediated disorders that affect the musculoskeletal system, soft tissues, blood vessels and connective tissue. Patients with rheumatic diseases need regular follow up for disease and drug toxicity monitoring. To cope with the increasing service demand, the Division of Rheumatology in the United Christian Hospital developed and expanded the shared care service. In the conventional practice, patients have to been seen by rheumatologist for every visit while the shared care service involved follow up by rheumatologist and rheumatology nurse in alternate sessions.
Objectives:
1.To evaluate the effectiveness and safety of the shared cared service
2To evaluate the effectiveness of reduction in workload of rheumatology clinic
Methods: This is a retrospective study involving the period from 1/1/2019 to 31/12/2019. Patients who attended the rheumatology nurse clinic for shared care were recruited and reviewed. All patients were selected and referred by rheumatologists. Criteria for shared care included regular follow up in rheumatology clinic and stable clinical condition. The length of follow up is adjusted according to patient condition. Services provided by rheumatology nurse (RhN) included disease education, drug and disease monitoring, drug advice and referral to other professionals and community service as indicated. During each visit, patient's vital signs, disease activity and laboratory results were assessed according to standard protocol. RhN will make discharge record to ensure continuity of care.
Results: Totally 489 episodes of attendance to nurse led clinic were recruited. Majority (97.3%) were arthritis patients. Others included lupus, vasculitis, Sjogren's syndrome and miscellaneous conditions. The length of follow up ranged from 3 weeks to 24 weeks and most of the patients were follow up between 8 to 16 weeks. Shared care patients included those with stable disease for interval monitoring, and patients for drug initiation and titration. The ratio for disease monitoring and drug monitoring are 41.3% and 58.7% respectively.
For the 489 episodes of attendance, 10 (2%) episodes needed rheumatologist intervention and 8 (1.6%) cases need advancement of follow up. Problems that required doctor interventions and advance follow up mainly are suboptimal disease control requiring medication adjustment or musculoskeletal ultrasound investigation.
178 (36.4%) episodes of nursing intervention were delivered, majority were medication advice (133, 27.2%). Reasons for nursing intervention included adverse drug reaction, abnormal investigation results, poor drug adherence and disease flare up. There were no emergency department attendance or admission related to rheumatic problems within one month of RhN follow up.
Conclusion: The shared care service is smooth and can safely lengthen the follow-up intervals to reduce clinic visit burden in rheumatology clinic. RhN input also allowed prompt advice for steroid tapering and dose titration for disease specific medication for better disease control. Proper case selection and close collaboration between rheumatologist and rheumatology nurse is the key.

HPR Professional education, training and competencies

AB1353-HPR **EMPOWERING LEARNERS TO "OWN" THEIR PERFORMANCE: PRESENTING EDUCATIONAL PERFORMANCE DATA BACK TO LEARNERS AS A COMPONENT OF AND RATIONALE FOR SUBSEQUENT EDUCATION**

E. Johnson[1], L. Eldasher[2], D. Clausen[3]. *[1]RMEI Medical Education, Outcomes & Analytics, Voorhees Township, United States of America*; *[2]RMEI Medical Education, Medical Strategy, Voorhees, United States of America*; *[3]RMEI Medical Education, Educational Strategy, Voorhees, United States of America*

Background: Beginning in 2016, RMEI created multiple accredited online education focused on RA and designed for rheumatologists. In 2018, the educational scope expanded to include live meetings, starting with a symposium at EULAR. For all programming from 2016-18 (6 courses, in both live and online settings), educational content was developed based on performance data from the previous RA courses. During the 2019 EULAR symposium, we presented the outcomes findings - from both the 2018 symposium and online courses – to the assembled rheumatologists, identifying ongoing educational gaps observed in their specialty population. The rationale: to create continuity between symposia over time by demonstrating incremental improvements and continuing areas of need, while also endowing learners with a greater sense of ownership and investment in forthcoming educational content.
Objectives: To evaluate the impact of presenting learner's educational performance data to them before education addressing persistent gaps identified in their performance the year prior.
Methods: Data collected during the 2018 EULAR symposium was analyzed to understand the underlying drivers impacting poor performance in an identified area of ongoing educational need (cycling versus switching TNF inhibitors). A linear regression model was run including all non-related curriculum, demographic, and evaluation questions as possible drivers against those related low-scoring (at Post-Test) curriculum questions. The content of RMEI's 2019 symposium at EULAR was developed to address the identified significant drivers to improve population proficiency in cycling versus switching. In addition to developing content based on the above findings, that data was also presented to learners in poster format prior to their participation in the 2019 symposium. During the period between on-site registration and the start of the symposium, attendees had the opportunity to explore data-driven insights, via audio-guided posters located around the meeting room. These insights included discussion of 2018 data analysis, identified drivers of poor performance, introduced the iterative data-driven methodology employed, and rationale behind content development for the 2019 symposium. At the conclusion of the 2019 symposium learners were asked to describe the impact/relevance of being presented with their performance data, their intention of incorporating course content into practice, and what specifically they intended to change.
Results: Data was collected on 135 clinicians (primarily physicians who actively treat patients with rheumatoid arthritis) who attended, and participated in, the symposium. With specific regard to the impact of seeing their own data presented back to them, 80% reported that seeing the learner data from the 2018 symposium enhanced their current learning experience. Further, 86% reported that they intended to incorporate course content into their clinical practice. Specifically, this population reported an intent to change their treatment approach and patient education practices.
Conclusion: Education is only as effective as the degree to which the audience is engaged. While year over year data from 2016 through 2018 demonstrated that an iterative approach facilitated the meaningful and necessary reinforcement of challenging concepts, learners in prior years were not aware of the methodological underpinnings of the educational offerings. Presenting this population with findings derived from their performance - as a rationale for the education they were about to participate in proved a compelling motivator for active learner engagement, and may have had a positive influence on the degree to which learners implemented course content into their clinical practice.

AB1354-HPR **CURRENT SITUATION OF TRAINING IN RHEUMATOLOGY IN THE POSTGRADUATE CURRICULUMS OF INTERNAL MEDICINE, FAMILY MEDICINE, GERIATRICS, PAIN MEDICINE AND, PHYSICAL AND REHABILITATION MEDICINE ACROSS COLOMBIA**

D. G. Fernández-Ávila[1], L. Patino[2], J. Gutiérrez[2]. *[1]Pontificia Universidad Javeriana – Hospital Universitario San Ignacio., Bogotá, Colombia*; *[2]Pontificia Universidad Javeriana – Hospital Universitario San Ignacio, Bogotá, Colombia*

Background: Rheumatic diseases are an important complaint in patients, although the incidence is low, they cause disability and impact on the health system. Currently, in Colombia, there are 198 rheumatologist, so it's important to know how is rheumatology training in specialties related to rheumatology, which are the specialties that the patient with a suspected rheumatic disease will visit at first.
Objectives: To describe the training status in rheumatology in the postgraduate curriculums of internal medicine, family medicine, geriatrics, pain medicine and, physical and rehabilitation medicine across Colombia.
Methods: This is a descriptive cross-sectional study. A survey was applied in each participating medical school using the RedCap® platform. The questionnaire included multiple-choice responses and a textbox to complete. The survey was done to the 29 registered medical schools which offer the specializations

already mentioned. The program director or an assistant professor was asked to fill the survey out between April 2019 and January 2020. The sample was described through means and standard deviations or frequency and percentages according to the type of variable.

Results: Data was obtained from all the programs of specialization in internal medicine (n = 29), family medicine (n= 9), pain medicine (n= 8), physical and rehabilitation medicine (n= 6), geriatrics (n= 4). All the programs of internal medicine, geriatrics, and physical/rehabilitation medicine have rheumatology as a mandatory subject within the curriculum, while in family medicine and pain medicine programs: 33% (n= 3), and 57% (n= 4) respectively, does not have a rheumatology training. In internal medicine the average duration of rheumatology training is 56 days (28 to 90 days), in geriatrics, it is 56 days (45-60 days), in family medicine 26.1 days (3 to 30), in medicine physical and rehabilitation medicine 35 days (30 to 60) and in pain medicine 40 days (30 to 60). 93.8% (n= 45) of the programs surveyed have a rheumatologist as a teacher in charge of both, the academic activities and the external rheumatology consultation and in the rest of the programs these activities are done by an specialist in internal medicine, family medicine or pain medicine. The theoretical components most frequently offered in seminars or master classes are: rheumatoid arthritis, lupus, vasculitis, spondyloarthritis, gout, osteoarthritis, sjogren's syndrome and osteoporosis. The specialization programs have an average of 3 rheumatologists as professors (range 1 to 8). 43.8% of the programs use some virtual resources to complement the teaching in rheumatology such as video conferencing in virtual platform or YouTube (8.3%), online course (6.3%), mobile application (16.7%), others such as moodle and webcast platform (12.5%). 92.9% (n = 52) offer their students an elective rotation in the rheumatology service, in addition to the mandatory one. Finally, 89.6% (n = 43) of the interviewees agree with the way in which the curriculum is structured in their programs, to approach initial diagnostic and therapeutic in patients with suspected or established rheumatic disease. However, 23.2% (n = 13) of the professors of the surveyed programs (6 of internal medicine, 4 of family medicine, 2 of pain medicine and 1 of physical/rehabilitation medicine), consider that the rheumatology subject should not be mandatory within their programs.

Conclusion: All physicians need to be familiar with rheumatological conditions since the rate of rheumatologists in Colombia is low. Knowing rheumatology is an increasingly important role in a clinical scenario in many postgraduate curriculums as we explain in this study.

AB1355-HPR THE IMPACT OF A STRUCTURED TRAINING PROGRAMME FOR THE DETECTION OF SYNOVITIS WITH MUSCULOSKELETAL ULTRASOUND (MSUS) IN RHEUMATOLOGY NURSING

L. Cano Garcia[1], C. Dominguez[2], S. Garcia Diaz[3], R. Segura[4], J. M. Martín Martín[5], F. G. Jiménez-Núñez[1]on behalf of OPEN REUMA. [1]*Instituto de Investigación Biomédica de Málaga (IBIMA), Hospital Regional Universitario de Málaga, Málaga, Spain*; [2]*Hospital Virgen Macarena, Sevilla, Spain*; [3]*Hospital Moisés Broggi, Sant Joan Despi, CSI, Barcelona, Spain*; [4]*Hospital Reina Sofía, Córdoba, Spain*; [5]*Hospital Universitario Nuestra Señora de la Candelaria,Tenerife, Spain*

Background:

Objectives: To analyse the effect of a teaching intervention for the technical performance of a reduced index of ultrasound synovitis by nurses without previous experience in musculoskeletal ultrasound (MSUS).

Methods: Design: Quasi-experimental study of the before-after type. Protocol: The nurses received a theoretical-practical, face-to-face and intensive training of 8 hours, by an expert rheumatologist in musculoskeletal ultrasound (MSUS), to perform the Perricone index, which assesses the presence of grey-scale synovitis (GS) and quantifies the presence of a power-doppler (PD) signal semiquantitatively (0-3), in 6 joints (Wrists, 2nd Metacarpophalangeal (MCP) joints and knees). The theoretical knowledge acquired was assessed by an exam test type at the end of the training, and the technical skills were assessed by an ultrasound examination in patients with rheumatoid arthritis, immediately after the teaching session and at 18 months later. Variables: Illumination of the consultation, protection of privacy and unequivocal identification of the patient, technique (explorer ergonomics, bilateral comparison, use of both hands, measurement, marking and saving data), GS (probe position, centred image, cortical-cartilage-tendon display, depth, focus, frequency, gain), PD (probe pressure, PRF, position-width-depth of the box, focus, frequency, gain), synovial recesses (dorsal and palmar examination of the wrist, 2nd Metacarpophalangeal (MCP) joints and supra and parapatellar medial and lateral examination of the knees) and semi-quantitative gradation of synovitis in GS and PD. Statistical analysis: descriptive analysis, and in relation to the statistical significance tests for paired variables (pre and post teaching intervention) the McNemar test was used for dichotomous qualitative variables and McNemar-Bowker test for those of more than two categories.

Results: 5 nurses, 80% women, aged between 36 and 54 years participated. They adequately answered 100% of the 4-student test questions, and the remaining one matched 80% of them. The average time of baseline exploration was 45,2 ±3,8 minutes and the final time was 32,6 ± 3,5, improving the 5 students in an average of 12,6± 4,4 minutes. The technical aspects not performed correctly in the baseline ultrasound examination were the bilateral comparative, centred image, grey scale gain, measuring, correct anatomical image of the synovial recess of the wrist and position-width-depth of the Doppler box. An improvement was observed at 18 months in the unequivocal identification of the patient, adequate illumination of the consultation, bilateral comparison, correct anatomical acquisition of synovial recesses and the quantification of GS synovitis, but no statistically significant differences were observed, before and after the teaching intervention, in possible relation with the difficulty to use the ultrasound in their respective Rheumatology Units in clinical practice, but mainly because the aspects correctly performed in the baseline exploration were numerous.

Conclusion: A formal training of rheumatology nurses in musculoskeletal ultrasound (MSUS) could be very useful, and cost-efficient, in the health care of patients with rheumatoid arthritis.

AB1356-HPR GOUT IN SPANISH PRIMARY HEALHCARE CENTERS: STILL A LONG WAY TO GO

M. A. Pou[1], S. Jeria[2], A. Prada-Ojeda[3], S. Ferrer[1], A. García-Guillén[2], H. Corominas[2], C. Diaz Torne[2]. [1]*EAP Encants, Barcelona, Spain*; [2]*Hospital de la Santa Creu i Sant Pau, Rheumatology, Barcelona, Spain*; [3]*Hospital de Torrejon, Madrid, Spain*

Background: Gout has a prevalence >2.5% in the Spanish adult population. It is a chronic disease that without proper treatment causes pain, joint deformity and increased cardiovascular risk and mortality. Recent advances have demonstrated that if correctly treated the disease can be controlled and even 'cured'. Most gouty patients are diagnosed and treated by general practitioners (GPs). There is evidence that the management if these patients is not good neither at Rheumatology Units nor at Primary Healthcare (PHC) centers.Several causes of this mismanagement can be found in the literature.

Objectives: Design and evaluation of the results of a questionnaire created from a bibliographic search focused on areas of improvement of gout management in PHC.

Methods: A search was made in Pubmed to identify the main barriers described in the management of patients with gout in primary care. The terms used were: "Gout", "primary healthcare" and "education". A Google Form of gout knowledge and management questionnaire was designed, taking into account what is described in the literature. The Google Form was sent to all GP from an urban area via mail and to other contacts via WhatsApp and twitter.

Results: Responses were obtained from 224 GPs; 69.5% were women; 73.1% had between 11 and 30 years of professional experience; 96.4% answered that gouty are mostly controlled in primary care; 99.6% performs the diagnosis of gout without analysis of synovial fluid and 17% diagnosed only by clinics without urate levels; 55.9% of GPs do not use any reference guide. Of those who use, the 73% use GUIPCLINGOT and 40% use SEMGs one; 80.5% have not done any gout course in the last 5 years; 26% did not have access to a rheumatologist to confirm the gout diagnosis; only 30.8% knew the therapeutic objective of the urate lowering therapy (ULT); 28.6% considered the beginning of ULT after the first attack; 62% believed that the most important part of the treatment was changing diet and lifestyles; 88.8% did not perform any specific education for these patients by the nurse; just 37.2% carried out a treat-to-target strategy to lower urate levels.

Conclusion: The questionnaire identifies multiple points of improvement for the management of this pathology in accordance with the described in the literature. Most GPs are unaware of the therapeutic objective of the ULT.

AB1357-HPR DESIGNING THE ROYAL COLLEGE OF NURSING COMPETENCY FRAMEWORK FOR RHEUMATOLOGY NURSES

P. Livermore[1], D. Finney[1], J. Begum[1], R. Wyllie[1], T. Cornell[1], H. Smith[1], L. Howie[1], L. Parker[1]on behalf of Royal College of Nursing Rheumatology Nurse Forum Competency working party. [1]*Royal College of Nursing, London, United Kingdom*

Background: The 1st Edition of the RCN Competency Framework for Rheumatology Nurse Specialists (RNS) will be published in March 2020. The role of the RNS is complex, and can include caring for children and young people. The importance of RNS's was highlighted by the National Rheumatoid Arthritis Society (NRAS 2017). The British Society for Rheumatology (BSR) outlined the need for education, training supervision and work force development. Education for RNS isn't currently centralized but is key to improving skills and developing workforce for the future. RNS are in short supply resulting in problems of access to services and delays in care (BSR 2019). In all 4 UK nations the titles of RNS and proficiency vary greatly (Titrate trial 2019) This is likely to have an impact on patient experience and outcomes. The European League Against Rheumatism (EULAR) developed

recommendations for the role of the RNS which were recently updated (Beech et al, 2019). This framework maps all of these requirements.

Objectives: This work supports the development of roles, improve access for patients and reduce. This document will act as a foundation for building sustainability and a more robust education and role development strategy. This work will strengthen rheumatology nursing and support all 4 UK nation's issues regarding recruitment, retention, sustainability, succession planning and benchmarking. Dissemination is key and we will work hard with stakeholders to ensure centralization of a nationally adopted framework. This abstract submission will increase dissemination opportunities.

Methods: Online data sources were searched for the most relevant and current evidence. Where research evidence wasn't available, existing and new knowledge was utilised from a consensus of clinical expert and patient opinions, several rounds of discussions took place virtually and face to face. RCN Rheumatology Nurse Forum Workshop attendees in June 2019 also answered a questionnaire to elicit views and demographic information regarding roles.

Results: The questionnaire results demonstrated 100% (n37) agreement with the development of the framework and that only 2 respondents had completed a competency process. 60% were RNS. Of these 52% (n13) were band 6, 47% (n9) were band 7, and 1% were band 8 consultant nurses. The questionnaire highlighted the need to develop the framework. Results were fed back to the working party to inform the domains to be included.

Conclusion: Document will be at BSR 2020 having successfully submitted a session proposal and abstract. Evaluation will begin later in the year 6 to 12 months from launch. We will measure impact using a variety of methods including membership Facebook pages and the questionnaire at point of download request. We will measure where and how the competency is being used and adoption of the framework throughout the UK.

AB1358-HPR DIAGNOSIS OF AXIAL SPONDYLOARTHRITIS: A PRIMARY UNMET EDUCATIONAL NEED FOR RHEUMATOLOGISTS

W. P. Maksymowych[1,2], L. Caplan[3], A. Deodhar[4], S. Dolatabadi[5], M. Hwang[6], A. Carlson[7], K. Steed[8], A. Carapellucci[2], J. Paschke[2], L. S. Gensler[9]. [1]*University of Alberta, Edmonton, Canada*; [2]*CARE Arthritis, Edmonton, Canada*; [3]*Rocky Mountain Regional VAMC, Aurora, United States of America*; [4]*Oregon Health & Science University, Portland, United States of America*; [5]*Harbor-UCLA Medical Center, Torrance, United States of America*; [6]*McGovern Medical School at UTHealth, Houston, United States of America*; [7]*University of Virginia, Charlottesville, United States of America*; [8]*James J Peters VA Medical Center, New York, United States of America*; [9]*University of California, San Francisco, San Francisco, United States of America*

Background: Diagnosis of axial spondyloarthritis (axSpA) is challenging because of absent physical findings in early disease and the limited diagnostic performance of laboratory markers. Considerable reliance is placed on imaging of the sacroiliac joints (SIJ) but specialty training is primarily focused on interpretation of plain radiographic abnormalities.

Objectives: We aimed to identify what might be the primary unmet educational needs of rheumatologists completing fellowship training by using clinical and imaging data from an inception cohort of patients presenting with undiagnosed back pain. We hypothesized that concordance would increase after imaging is reviewed after the clinical data.

Methods: The diagnosis of axSpA was compared between local rheumatologists, axSpA experts and pF using clinical and imaging data from the multicenter Screening for Axial Spondyloarthritis in Psoriasis, Iritis, and Colitis (SASPIC) Study. In this inception cohort, patients ≤45 years of age with ≥3 months back pain undergo diagnostic evaluation by a local SASPIC rheumatologist, including imaging of the SIJ, who then records a global evaluation of presence/absence of axial SpA. This is done at 3 consecutive stages: 1.After the clinical evaluation. 2.After the results of labs (HLA B27, CRP) and radiography. 3.After review of the local MRI. In this exercise, 20 cases were selected from the SASPIC cohort and the rheumatologist global evaluations were removed from the eCRFs. Four experts in axSpA reviewed the clinical and imaging data in each eCRF and provided their global evaluations for stages 1, 2, and 3 of these 20 cases. Subsequently, 4 pF rheumatologists conducted the same exercise blinded to the assessments of the local rheumatologist and experts in axSpA. Concordance (% agreement) between the assessors was analyzed.

Results: Diagnosis of axSpA by the local SASPIC rheumatologist was made in 90%, 65%, and 75% of cases after stages 1, 2, and 3, respectively. Majority diagnosis of axSpA by experts was made in 84.2% (16/19), 57.9% (11/19), and 63.2% (12/19), after stages 1,2, and 3, respectively. Majority diagnosis of axSpA by pF rheumatologists was made in 94.4% (17/18), 100% (16/16), and 93.8% (15/16). Concordance among experts and between experts and local SASPIC rheumatologists increased after review of imaging data. For pf-rheumatologists concordance with experts increased after review of imaging for 2 assessors and decreased for the other 2 assessors. For the latter, the primary reason for decrease in concordance with experts was false positive diagnosis of axSpA in 35% and 30% of the cases after review of the imaging.

Conclusion: A structured case-based and sequential evaluation of clinical and imaging data suggests a gap in the training of recently graduated rheumatologists, with over-interpretation of imaging leading to false positive diagnosis of axSpA.

Assessors	Mean % Concordance (range) for diagnosis of axSpA		
	Stage 1	Stage 2	Stage 3
Experts in axSpA	64.2 (45-80)	75.8 (65-85)	84.2 (70-95)
Local rheumatologist vs Experts in axSpA	73.8 (70-80)	83.8 (80-85)	83.8 (80-90)
pF rheumatologist 1 vs Experts consensus	78.9	94.4	94.7
pF rheumatologist 2 vs Experts consensus	89.5	61.1	68.4
pF rheumatologist 3 vs Experts consensus	63.2	72.2	84.2
pF rheumatologist 4 vs Experts consensus	89.5	66.7	68.4

AB1359-HPR PERCEPTION ABOUT FIBROMYALGIA AND ITS ACCOMPANYING SYMPTOMS AMONG MEXICAN PHYSICIANS

R. I. Arvizu-Rivera[1], N. Escobedo-Zuñiga[1], I. J. Colunga-Pedraza[2], G. Serna-Peña[2], A. Cárdenas[2]. [1]*Hospital Universitario "Dr. Jose Eleuterio Gonzalez", Internal Medicine Department, Monterrey, Mexico*; [2]*Hospital Universitario "Dr. Jose Eleuterio Gonzalez", Rheumatology Division, Monterrey, Mexico*

Background: Previous studies showed that 93% of rheumatologists consider fibromyalgia (FM) as a clinical entity. However, accompanying symptoms such as fatigue, widespread pain, sleep disturbance and headache are underrecognized among physicians. According to a previous study, most recognized symptoms by general practitioners are fatigue and widespread pain (72.6%), while about thirty percent of physicians recognize sleep disturbance and depression as symptoms.

Objectives: To investigate physicians' point of view of FM accompanying symptoms in northeastern Mexico.

Methods: We designed an electronic survey about physicians' perceived importance of depression, fatigue, widespread pain, sleep disturbances, headache and irritable bowel disease symptoms (pain and cramping) in patients with FM. Questions were answered using a 5-point Likert scale: 1, strongly disagree; 2, disagree; 3, neutral; 4, agree; 5, strongly agree. General practitioners, rheumatologists, neurologists, psychiatrists were included.

Results: A total of 236 physicians were included: general practitioners, 149 (59.3%); rheumatologists, 21 (8.9%); neurologists 18 (7.6%); psychiatrists 8

(3.4%), and family physicians, 49 (20.8%). FM was considered a clinical diagnosis by 208 (88.1%) and most physicians think FM is both a physical and psychological condition, 190 (80.5%). Full results on physicians' perceptions is shown in Table 1. Fatigue was the symptom which most physicians agreed or strongly agreed was important in FM, 219 (92.7%). Disagreement (any degree) was greater regarding abdominal pain/cramping being an important symptom in FM, 52 (22%). Complete results can be seen in Image 1.

Table 1. Perceptions' of physicians about FM.

Variable	
FM is a clinic diagnostic, n (%)	208 (88.1)
Unsure FM is a clinical diagnostic, n (%)	12 (5)
FM is a physical illness, n (%)	33 (14)
FM is a psychological illness, n (%)	11 (4.7)
FM is both physical and psychological, n (%)	190 (80.5)
FM has a negative impact on quality of life, n (%)	227 (96.2)
FM has a negative impact on life expectancy, n (%)	135 (57.2)

Conclusion: FM was considered a clinical diagnostic and an illness both physical and psychological by most physicians. Headache and abdominal pain/cramping are symptoms less likely to be perceived as important in patients with FM.

AB1360-HPR

A MODEL TO IMPROVE MINORITY PATIENT RECRUITMENT IN LUPUS CLINICAL TRIALS - THE AMERICAN COLLEGE OF RHEUMATOLOGY MIMICT PROJECT EXPERIENCE

S. Sheikh[1], N. Wanty[2], S. Mccalla[3], A. Santana[1], S. Saxena Beem[1], J. Walker[1], D. Holt[4], A. Howell[4], K. Holtz[2], S. Williams[3], A. Anandarajah[4]. [1]*University of North Carolina, Chapel Hill, United States of America*; [2]*KDH Research & Communication, Atlanta, United States of America*; [3]*American College of Rheumatology, Atlanta, United States of America*; [4]*University of Rochester, Rochester, United States of America*

Background: In the US, African Americans and Latinos are underrepresented in lupus clinical trials (LCTs),[1] despite experiencing the greatest lupus disease burden.[2,3] Low participation in LCTs results in inadequate data on treatment effectiveness for minority patients, and fewer opportunities for better care and treatment options.[1] Only one percent of minority patients are referred to clinical trials each year.[4] Provider barriers to making referrals include limited time and unfamiliarity with lupus and LCT opportunities.[4] Using US fedral grant funds, the American College of Rheumatology (ACR) developed MIMICT, a two-part model with associated materials to address provider-side LCT referral barriers. The materials include a toolkit for clinical trial sites and an educational toolkit for providers.

Objectives: Our objectives are to:

•Describe the US LCTs disparities.

•Discuss the research methodology to evaluate the two-part MIMICT model.

•Assess the feasibility of the model to increase minority involvement in clinical trials.

Methods: We designed two studies to evaluate the MIMICT model.The first study used an online, pretest/posttest, two-group evaluation approach to assess the extent to which the educational toolkit increased providers' knowledge, attitudes, self-efficacy, and behavioral intentions to refer minority patients to clinical trial. We conducted the study in 2018 with primary care providers (PCPs) and again in 2019/2020 with speciality providers. The second study used a longitudinal, mised methods, case-study approach to explore the real-world use of the toolkits with clinical trial site teams at two university medical centers.

Results: In the first study,among MIMCT-exposed PCPs, mean scores indicated statistical significance at p≤0.001 with more knowledge about referring [55.84 (sd=23.51) vs 41.76 (sd=19.98)], more self-efficacy to refer [55.00 (sd=37.22) vs. 37.99 (sd=34.42)], and more intentions to refer [61.36 (43.85) vs. 33.41 (41.16)] African American patients to LCTs among the treatment group than the control group, respectively. This presentation will discuss additional data comparing the study in 2018 and the study in 2019/2020 and look comparatively at outcomes across provider type.

In the second study, we found that the driver for successful engagemetn of providers and their subsequent use of the educational toolkit was the development of a trusting relationship between the clinical trial site teams and providers in the community. The development of trust took repeated and varied modes of contact, which we will discuss in-depth.

Conclusion: The MIMICT educational toolkit increase knowledge, self-efficacy, and intentions to refer lupus patients to LCTs. However, building trust between LCT sites and local providers takes time and repeated outreach, but the potential benefits to medicine and minority health are substantial.

AB1361-HPR

PRIMARY CARE PHARMACOLOGICAL TREATMENT FOR PATIENTS WITH HAND ARTHRALGIA

M. M. Castañeda-Martínez[1], G. Figueroa-Parra[1], D. Vega-Morales[1], J. M. Calderón Espinosa[1], B. R. Vázquez Fuentes[1], J. A. Esquivel Valerio[1], Y. G. Ordoñez Azuara[2], D. Á. Galarza-Delgado[1]. [1]*University Hospital "Dr. José Eleuterio González", Rheumatology Service, Monterrey, Mexico*; [2]*University Hospital "Dr. José Eleuterio González", Family Medicine Service, Monterrey, Mexico*

Background: Primary care physicians (PCP) are the first point of contact for patients with a new-onset inflammatory rheumatic disease, like rheumatoid arthritis (RA). Consequently, primary care is crucial to the early diagnosis and prompt treatment of such individuals. The first three months following the onset of RA symptoms represent an important therapeutic window. Historically, patients with inflammatory arthritis received first-line treatment with non-steroidal anti-inflammatory drugs (NSAIDs), moving to synthetic disease-modifying anti-rheumatic drugs (DMARDs) relatively late in the disease process. As synthetic DMARDs are usually initiated in secondary care by rheumatologists, PCP focus on alleviation of patient's discomfort. Documented problems in primary care practice include accuracy of diagnosis, test ordering, medication use and delays in referral.

There is no evidence of which is the pharmacological treatment more commonly used for hand arthralgia in Family Medicine patients of a university hospital on their first or second visit.

Objectives: To examine the primary care physicians' pharmacological treatment prescribed for hand arthralgia in a Family Medicine Consultation.

Methods: In a period of a year and two months, eligible patients were recruited on their first or second visit to the Family Medicine Consultation of the Hospital Universitario "Dr. José Eleuterio González" in Monterrey, Nuevo León, México. Eligible patients were adults (aged≥18 years) with hand arthralgia as their chief complaint, who had not rheumatologic diagnosis and wasn't caused by trauma. Ninety patients were recruited, data were collected by capturing the prescription made by PCP.

Results: In this cohort of 90 patients, 71 (78.9%) were women. Of the 90 patients, 19 (21.1%) had no pharmacological prescription at all. Forty-nine patients (54.4%) had one prescribed drug, 17 (18.9%) had two drugs and 5 (5.6%) had three drugs. Prescribed drugs and their frequencies are reported in Table 1.

Table 1. Prescribed drugs and frequencies.

Drug	n (%)
No treatment	19 (21.1)
Celecoxib	26 (28.9)
Oxicams	22 (24.4)
Propionic acid derivatives	6 (6.7)
Phenyl Acetic acids	5 (5.6)
Acetaminophen	15 (16.7)
Tramadol	12 (13.3)
Steroids	11 (12.2)
Methotrexate	1 (1.1)

Conclusion: The most common group of drugs used for hand arthralgia in this cohort of patients was NSAID, and the most used of this group was celecoxib. Only in one patient, PCP prescribed disease-modifying anti-rheumatic drugs (DMARD) therapy, in this case was methotrexate. Almost 80% of the patients were prescribed with at least one drug without knowing the final diagnosis.

Background: Intra-articular therapies (IAT) are routinely used in rheumatic and musculoskeletal diseases (RMDs); however large variability exists regarding current practice of delivery amongst health professionals.

Objectives: To inquire about common practice aspects to inform the EULAR Taskforce for the IAT of arthropathies.

Methods: A steering committee prepared a 160-item questionnaire based on the information needs of the Taskforce. The survey was disseminated via EULAR professional associations and social media and it was open to any health professional treating persons with RMDs, regardless of using IAT personally.

Results: The survey was answered by 186 health professionals from 26 countries, the large majority of whom (77%) were rheumatologists, followed by nurses (12%), general practitioners (2%) and orthopaedic surgeons (2%). The two collectives that perform IAT routinely are rheumatologists (97%) and orthopaedic surgeons (89%), with other professionals <50%. Specific training was compulsory for 32%. The most frequent indication for IAT is inflammatory arthritis (76%), followed by osteoarthritis (74%), crystal arthritis (71%) and bursitis (70%); and all joints are injected, with knee (78%) and shoulder (70%) being the most frequent. When questioned about specific contexts, such as pre-surgical, diabetic or hypertensive patients, variability among respondents was evident, with around 30 to 69% of professionals considering it acceptable to inject glucocorticoids (GC), while in others there was less variability (prosthetic or septic joints, <1%). GCs are the most used compounds, followed by hyaluronic acid and saline/dry puncture. Only 66 (36%) use ultrasound to guide IAT. In their opinion, to be accurately in the joint is moderately to largely important for large joints (80%) and very important in small joints. The maximum number of injections to perform safely in the same joint within one year was "2 to 3" for 65% (2% thought there is "No limit"). The majority reported that they informed patients about side-effects (73%), benefits (72%), and the nature of the procedure (72%), and less frequently about other aspects; with 10% obtaining written consent and 56% oral consent (mandatory only for 32%). Other questions help to understand the setting and procedures followed, including use of local anaesthetics and care after injection.

Conclusion: Although often performed in clinical practice for RMDs, there is apparent variability in several elements related to delivery of this treatment. This information, together with patient input, will help design current recommendations where research evidence is not available.

AB1363-HPR EVALUATION OF SELECTION CRITERIA OF CLINICIANS IN THE TREATMENT OF OSTEOPOROSIS, OSTREQ RESEARCH IN TURKEY

E. G. Kahraman[1], S. Akar[1], B. Ö. Pamuk[1]. [1]*İzmir Katip Çelebi Üniversitesi Atatürk Eğitim ve Araştırma Hastanesi, Izmir, Turkey*

Background: Osteoporosis is a disease with increasing prevalence in the aging and growing world population and its insidious progression and lack of findings without fracture cause certain difficulties in the diagnosis and treatment of this disease. There are many medical and paramedical treatment options for osteoporosis, and clinicians make these treatment decisions with many factors in mind.

Objectives: We wanted to evaluate the importance of these factors for clinicians through a questionnaire. This 17-question questionnaire aimed to investigate the factors that clinicians consider in the planning of osteoporosis treatment and the effect of these factors on treatment planning. We made the Turkish version of the OSTEQ questionnaire in this study which factors clinicians in planning treatment for osteoporosis in Turkey we aimed to investigate that take into consideration.

Methods: OSTREQ questionnaire developed by Makraz et al. are used in this research. In this survey, which consists of 8 sections (health care system, patients' preferences regarding regimen's administration, usage, cost, severity of disease, treatment efficacy, safety profile and pharmaceutical industry) and 17 questions, the participants were asked to evaluate their answers with 5 different scales: Absolutely Preventive, Partially Preventive, Neither Preventive or Encouraging, Partially Encouraging, Absolutely Encouraging.

Clinicians of Rheumatology, Physical Therapy and Rehabilitation, Endocrinology and Metabolic Diseases participated in our study. The questionnaires were filled in by e-mail or by inviting the participants to the our university or by going to the clinics where the clinicians were working.

Results: In our study 37 (21.8%) were endocrinology, 49 (28.8%) were rheumatology and 84 (49.4%) were physical therapy and rehabilitation specialists. The overall Cronbach alpha coefficient of the questionnaire was found to be 0.855. No material was found to significantly increase the internal reliability coefficient if deleted. As a result of t-test in 27% lower and upper groups to measure the discriminative power of the items, it was seen that all items made a significant difference in the lower and upper groups, which were formed according to the total score of 27 people. Confirmatory factor analysis and internal reliability results did not require removal of

the substance, so the substance was not removed. When the responses of the specialist physicians participating in our study to the osteoporosis preference criteria questionnaire were examined according to their specialty, no statistically significant difference was found between specialty branches but only significant difference was found in health system and cost subscale according to branches (p = 0.013). Post-hoc test (LSD) was used to find out the group that made a significant difference in health system and cost sub-factor. higher scores (p = 0.034).

Conclusion: We developed and validated a general osteoporosis treatment questionnaire that could provide assessment of the criteria that physicians take into consideration when they decide to implement a regimen for osteoporosis. This tool could assist health care systems and pharmaceutical companies understand which parameters drive physicians' choices regarding the treatment of osteoporosis.

AB1364-HPR IS ADHERENCE TO TREATMENT RELATED TO THE EFFECTIVENESS OF ANTI-TNFS IN PATIENTS WITH RHEUMATOID ARTHRITIS? - ANALYSIS OF A REAL-WORLD COHORT

P. Osorio[1], L. Villarreal[1], M. Cabrera[2], O. Valencia[2], P. Santos-Moreno[3]. [1]*Biomab - Center for Rheumatoid Arthritis, Psychology, Bogota, Colombia*; [2]*Biomab - Center for Rheumatoid Arthritis, Data Administration, Bogota, Colombia*; [3]*Biomab - Center for Rheumatoid Arthritis, Rheumatology, Bogota, Colombia*

Background: Several medicines are prescribed for chronic disease management of rheumatoid arthritis (RA) including biologics; however, adherence to long-term therapy remains poor because many causes; the latter results in worsening clinical results.

Objectives: To analyze the relationship between adherence to treatment and the achievement of remission or low disease activity in patients with RA treated with three anti-TNF molecules of subcutaneous use.

Methods: In patients treated with 3 subcutaneous anti-TNFs, with at least one year of follow-up previously, adherence was measured with Compliance Questionnaire for Rheumatology (CQR19) applied by psychologist; the CQR19 is a 19 item, self-administered questionnaire that was developed with the aim of correctly identify rheumatology patients that were classified as "low" adherers (taking <80% of their medication correctly) and defining as high adhesion a result greater than 80%; adherence also was measured with medication possession rate (MPR) and attendance to scheduled consultations with the interdisciplinary team in each period measured. The effectiveness by DAS28, HAQ and the other measurements were made in three periods: at baseline (BL), 6 months (M6) and 12 months (M12). A Pearson correlation was made between the number of patients in remission and low disease activity by type of molecule and period, with adherence criteria.

Results: 112 patients diagnosed with RA were included, 34.8% (39/112) treated with adalimumab, 38.4% (43/112) etanercept and 26.8% (30/112) golimumab; The results of CQR19 at BL, M6 and M12 were greater than 80%, with no statistically significant differences between the three molecules. The MPR was higher than 80% in the three periods, being very similar between the three molecules, but in M12 period the difference in MPR between adalimumab 86% and golimumab 92.1% was statistically significant (p <0.005), for etanercept it was of 90%. Regarding to DAS28 and HAQ, there were no differences between the biologics analyzed; However, the highest percentage of patients with low disease activity and remission had a higher correlation with attendance to the consultations scheduled in the interdisciplinary RA care model (r = 0.78) p <0.005 (see tables).

CQR19				MPR		
	BL	M6	M12	BL	M6	M12
ADALIMUMAB	89,7	89,3	90,1	98,5	90,5	86,1
ETANERCEPT	87,4	89,7	89,7	97,9	89,6	90,9
GOLIMUMAB	88,2	87,6	91,5	97,1	96,1	92,1

No statistical differences in adherence between biologics were found depending on sex, type of concomitant conventional treatment for RA or presence of comorbidities.

RELATION BETWEEN Rem/LDA AND COMPLIANCE WITH APPOINTMENTS

	Rem	LDA	MDA	HDA	
ADALIMUMAB	63%	60%	53%	29%	P<0,005
ETANERCEPT	66%	62%	73%	-	-
GOLIMUMAB	68%	73%	55%	-	P<0,005

Conclusion: There seems to be a higher MPR with the monthly golimumab compared to the biweekly adalimumab and weekly etanercept; however, it does not necessarily imply greater effectiveness. Longer term studies are needed to confirm if there is better adherence and clinical results with monthly anti-TNFs than to other dosing regimens. Patients with remission and low disease activity had greater assistance to scheduled consultations with the interdisciplinary group, regardless of the type of molecule used. This study confirms the relation between adherence to medications and care model with clinical results.

AB1365-HPR FREQUENCY OF JOINT DAMAGE IN PATIENTS WITH ULCERATIVE COLITIS

D. Tarasova[1], L. Shilova[1], E. Lutaya[1], E. Korenskaya[1], M. Koroleva[1], A. Feoktistova[1]. [1]*Volgograd State Medical University, Volgograd, Russian Federation*

Background: Ulcerative colitis (UC) is considered as a systemic autoimmune disease with lesions of the colon mucosa. The current of UC is often accompanied by different extra-intestinal manifestations. Their frequency, according to various studies, varies widely – from 25 to 60 %. It is a serious problem that affects the quality of life and the effectiveness of therapy [1, 2]. Rheumatological manifestations, in particular, damage to the joints and spine, are one of the extra-intestinal manifestations and they are of particular importance. To date, the relationship between UC and joint damage has not been fully studied. These diseases can occur independently in the body or have a common autoimmune or inflammatory nature. It is believed that having common pathogenetic mechanisms of development, UC and joint damage can be different clinical forms of the same disease.

Objectives: To evaluate the frequency of clinical manifestations of joint damage in patients with ulcerative colitis.

Methods: The study was conducted at the gastroenterological Department of the Hospital №25 (Russia, Volgograd). Archived data from the case histories of 69 patients with a confirmed diagnosis of ulcerative colitis were analyzed, including 58 men (30.4%) with an average age of 33.4 years, and 38 women (69.5%) with an average age of 37.6 years.

Results: Among 48 patients with UC, extra-intestinal manifestations were detected in 40 (41.6%) patients. A total lesion of the large intestine was found in 20 patients (20.8%), left-sided colitis in 14 (14, 6%), proctosigmoiditis in 6 (6.25%). The diagnosis was made for the first time in 4 patients (4.16%), 36 patients (37.5%) were admitted to the hospital again due to an exacerbation of the disease. Among the extra-intestinal manifestations, joint lesions prevailed: 20 patients (20.8%) showed clinical signs of peripheral arthritis, spondyloarthritis was detected in 8 patients (8.3 %), and 6 patients (6.25 %) had symptoms of unilateral sacroiliitis. 4 (4.16%) patients were diagnosed with nodular erythema. Primary sclerosing cholangitis was detected in two patients (2.08%).

Conclusion: The development of extra-intestinal manifestations in UC is largely determined by the course of the disease and the length of the inflammatory process in the colon. More than a third of patients with UC revealed extra-intestinal manifestations, among which the most common signs of joint damage were present, which necessitates timely diagnosis of extra-intestinal manifestations and involvement of a rheumatologist in the management of this category of patients.
