Methods: Cross-sectional study. Fifty-one Latin American ultrasonographers took part in a web- based US exercise evaluating images from 20 RA patients. The 4 joints US score was calculated for each patient including bilateral radiocarpal, midcarpal and second metacarpophalangeal joints. PD and GS were graded from 0 to 3. US scores comes as the result of the addition of PD and GS score, being 36 the highest disease activity.
Five patients were evaluated twice in order to address intra – rater reliability. The inter and intra-rater reliability was assessed using a two-way random, absolute, individual and average-measures intra-class correlation coefficient (ICC). We stratified sonographers according to experience (defining High experience as: at least 5 years of experience and 80 US assessments/month).
Results: A total of 1020 US image assessments were performed. Mean 4-joints US score was 17±8. The ICC was in the excellent range for intra [(individual ICC = 0.945 (IC95% 0.905–0.965); average ICC =0.972 (IC95% 0.950–0.982)] and

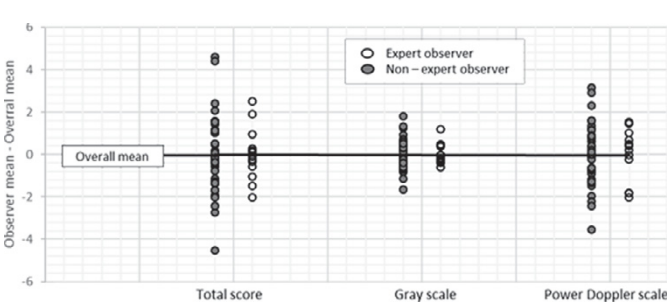

Figure 1, Agreement with the mean between multiple observers in total score, gray and power doppler subscale.

inter- reader reliability [(individual ICC =0.867 (IC95% 0.786–0.934); average ICC = 0.997 (IC95% 0.995–0.999)].
When comparing high with low experience sonographers, there was no significant differences in intra-class correlation coefficient. However, there was a greater variation between the means among low experience readers (13 to 22) and higher experience sonographers (14–18) (Figure 1).
Conclusions: US reliability is related to sonographer expertise and experience.

AB1061 THE HIGH DOSES GOLIMUMAB BRING BETTER SUPPRESSION OF ULTRASONOGRAPHIC SYNOVIAL INFLAMMATION IN PATIENTS WITH RHEUMATOID ARTHRITIS?

T. Okano[1], K. Inui[1], Y. Sugioka[2], K. Mamoto[1], T. Koike[2,3], H. Nakamura[1].
[1]Department of Orhopedic surgery; [2]Center for Senile Degenerative Disorders (CSDD), Osaka City University Graduate School of Medicine, Osaka; [3]Search Institute for Bone and Arthritis Disease (SINBAD), Shirahama Foundation for Health and Welfare, Wakayama, Japan

Background: Biologic diseasemodifying antirheumatic drugs (bDMARDs) that target cytokines and cytokine receptors such as tumor necrosis factor (TNF)alpha and interleukin (IL)6 have been established as a standard therapy of rheumatoid arthritis (RA) for patients with conventional systemic DMARDs, such as methotrexate (MTX), resistant disease. Golimumab, one of the bDMARDs, is an antibody targeting to TNF-alpha. In Japan, we can choose the dose of golimumab 50mg or 100mg according to the disease activity. Recent advance of ultrasound (US) equipment allows obtaining high-quality gray-scale (GS) imaging and sensitive power Doppler (PD) assessment, especially at small joints of the hands and feet. To date, US is the most sensitive imaging modality available in daily rheumatology practice for the assessment of residual synovitis.
Objectives: The aim of this study was to compare the ultrasound findings between patients with rheumatoid arthritis (RA) treated by golimumab 100mg and 50mg.
Methods: Patients with RA treated by golimumab were consecutively included. Ultrasound examination was performed at 52 synovial sites, bilateral first to fifth MCP, first IP and second to fifth PIP joints, first to fifth flexor tendon and wrists, 2nd and 6th compartment of extensor tendons and first to fifth MTP joints, by using HI VISION Ascendus (Hitachi Medical Corporation, Japan) with a multifrequency linear transducer (18–6 MHz). The GS and PD signals were scored in each synovial site using a semi-quantitative scale from 0 to 3.
Results: Fifty-five patients with RA (46 female, mean age: 64.2±12.1 years) were included and analyzed. In comparison between the dose of Golimumab at the time of ultrasound examination, disease activity (DAS28-CRP) was significantly higher in 100mg group (100mg, n=15: 3.6±1.0, 50mg, n=40: 2.3±0.9; $p<0.001$), but ultrasound findings were not significantly different between golimumab 100mg and 50mg groups. In patients achieving remission, ultrasound findings were not different between 100mg started and 50mg started groups.

Table 1. The comparison between golimumab 100mg and 50mg RA patients at the time of ultrasound examination

	Golimumab 100mg (n=15)	Golimumab 50mg (n=40)	*P* value
Age (years old)	60.3±12.2	65.6±12.0	0.161
Disease duration (years)	17.5±9.6	14.2±9.5	0.263
Duration of golimumab use (years)	1.8±0.9	2.1±1.5	0.542
DAS28-CRP	3.6±1.0	2.3±0.9	<0.001
SDAI	14.0±6.9	5.7±5.0	<0.001
Total GSUS score	16.9±12.6	14.8±12.7	0.572
Total PDUS score	11.3±9.07	6.5±6.0	0.076
Maximum PDUS grade	2.0±1.0	1.6±0.8	0.207

Conclusions: Even patients have high disease activity, golimumab 100mg suppress the synovitis and tenosynovitis very well. In the condition where disease activity was sufficiently controlled, there was no difference in the synovitis findings of ultrasound at the dose of golimumab.

AB1062 PATTERNS OF MUSCULOSKELETAL SYSTEM INVOLVEMENT IN PATIENTS WITH TYPE I AND TYPE II DIABETES MELLITUS

T.I. Adrosy, M.I. Hanafy, H.S. Hamoud, A.A. Negm. *Rheumatology Department, Faculty of Medicine, Al-Azhar Univerist, Cairo, Egypt*

Background: Diabetes mellitus (DM) is a chronic disease, no known cure except in very specific situations. Musculoskeletal Utrasonography (MSUS) has a great sensitivity that can help clinical examination for the detection of peripheral enthesitis associated with DM
Objectives: To study the different patterns of musculoskeletal (MSK) system affection in both types of diabetes mellitus (DM).
Methods: We performed a retrospective single-center study on sixty five patients during the period from May 2014 to February 2015, to evaluate MSK manifestations in diabetic patients at Sayyed Galal University Hospital, Cairo, Egypt. Patients were identified as diabetics based on Diagnosis and Classification of Diabetes Mellitus diagnostic criteria (1997) (1). Clinical data, laboratory investigations, X-ray, musculoskeletal ultrasonography (MSUS) (2) and Bone mineral density was measured using Dual energy X-ray absorptiometry (DEXA) scan (3) were all collected from all patients.
Results: We included 65 diabetic patients; of these 21 patients (32.31%) had type I diabetes while 44 patients (67.69%) had type II diabetes. Age in type I was 24.5±10.5 years while in type II was 50.1±8.44 years (P=0.001). DM type II showed higher BMI (P=0.001), fatigue (P=0.005), shoulder periarthritis (frozen shoulder) (P=0.034), knee osteoarthritis (P=0.002), cheiroarthropathy (P=0.016), anserine bursitis (P=0.001) and plantar fasciitis (P=0.003) than type I. Osteoporosis was found in both types but type II showed more prevalence 13/44 patients (29.5%) while type I showed only 3/21 (14.2%). No statistically significant difference between both groups as regard t-score in the three sites. MSUS showed increased prevalence of quadriceps tendon enthesophytes in type I (P=0.033), while Infrapatellar (P=0.023) and retrocalcaneal bursitis (P=0.001) were more prevalent in type II DM.
Conclusions: Early evaluation of any diabetic patient regarding BMD by DEXA scan and soft tissue by MSUS seems to be beneficial for early detection of any abnormality and therefore early management and prevention of complications.

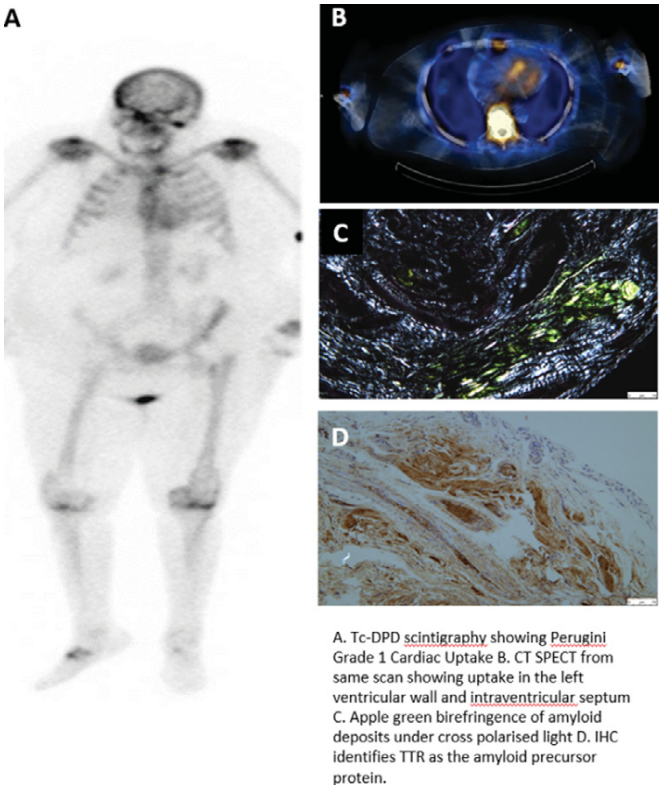
AB1063 ULTRASONOGRAPHIC ASSESSMENT OF SYNOVITIS IN PATIENTS WITH LESSOR TOE DEFORMITY DUE TO RHEUMATOID ARTHRITIS

T. Kashiwagura[1], Y. Kimura[2], I. Wakabayashi[3], M. Fujii[2], M. Kobayashi[4], M. Urayama[5], T. Aizawa[6], Y. Sugimura[7], H. Aonuma[8], N. Miyakoshi[9], Y. Shimada[10]. *[1]Department of Orthopedic Surgery, Akita City Hospital; [2]Department of Orthopedic Surgery; [3]Department of Rehabilitation Medicine, Akita City Hospital, Akita; [4]Department of Orthopedic Surgery, Hiraka General Hospital, Yokote; [5]Department of Orthopedic Surgery, Ogachi General Hospital, Yuzawa; [6]Department of Orthopedic Surgery, Kita Akita Municipal Hospital, Kita Akita; [7]Department of Orthopedic Surgery, Nakadori general hospital, Akita; [8]Kakunodate general hospital, Senboku; [9]Akita University Graduate school of Medicine, Akita, Japan; [10]Department of Orthopedic Surgery, Akita University Graduate school of Medicine, Akita, Japan*



Background: In recent years, joint ultrasonography has been widely used for the diagnosis and treatment of rheumatoid arthritis (RA), allowing visualization of synovitis. Its clinical usefulness in early diagnosis and evaluation of disease activity has been reported. Continuous inflammation, osteochondral destruction, and soft tissue destruction due to synovitis in toe joints result in various clinical pictures of the foot. In the lateral toes in the forefoot, subluxation or luxation of the metatarsophalangeal (MTP) joints may occur, leading to painful callosities and resultant disturbance in activities of daily living. Few reports have addressed toe deformity and joint ultrasonographic findings of synovitis in the forefoot.
Objectives: In this study, lateral MTP joints were assessed using joint ultrasonography in RA patients to examine the correlation with deformity.
Methods: Seventy feet of 61 RA patients were examined in the outpatient clinic of our hospital. Patients who underwent surgery were excluded. The mean age of the patients was 66 years (24 to 92 years), and the mean duration of disease was 12 years and 9 months (1 month to 40 years). Biologic products were used for 23 feet. Joint ultrasonography was performed by the same examiner, using the same room and apparatus. Synovitis was defined as Grade 1 or more as determined by the power Doppler method. Based on foot radiographs in upright position obtained before and after ultrasonography, patients with luxation, subluxation, and joint fissure narrowing were classified into the deformity group, those with bone erosion and geode formation into the bone erosion group, and lack of abnormal findings into the normal group.

Results: Synovitis was found in MTP joints in 41 (14.6%) of 280 toes. The incidence rates of synovitis in the deformity group, the bone erosion group, and the normal group were 27.3%, 13.1%, and 6.7%, respectively. Synovitis was found in 21.7% of patients on therapy with biologic products and in 38.3% of those without such therapy. There were no significant differences in the mean duration of the disease, visual analogue scale score, erythrocyte sedimentation rate, matrix metallopeptidase 3 level, or health assessment questionnaire score among the 3 groups.
Conclusions: Synovitis was also found in patients who showed no changes on imaging of the toes. Synovitis persisted in some patients even after establishment of toe deformity. Drug therapy, intensification of conservative therapy, and synovectomy should be considered to prevent further deformation.

AB1064 CARPAL TUNNEL BIOPSY AND BONE SCINTIGRAPHY USING THE TECHNETIUM-3,3-DIPHOSPHONO-1,2-PROPANODICARBOXYLIC ACID (99M) (TC-DPD) TRACER CAN IDENTIFY CLINICALLY SILENT CARDIAC AMYLOIDOSIS AT A POTENTIALLY TREATABLE STAGE

T.A.-B. Youngstein[1], S. Tsamados[2], J.A. Gilbertson[1], L. Smith[1], D. Hutt[1], T. Lane[1], D. Rowczenio[1], T. Rezk[1], C.C. Quarta[1], R. Manwani[1], C. Whelan[1], M. Fontana[1], H.J. Lachmann[1], J.D. Gillmore[1], N. Goddard[2], P.N. Hawkins[1].
[1]National Amyloidosis Centre, UCL Division of Medicine; [2]Department of Orthopaedics, Royal Free London NHS Foundation Trust, London, United Kingdom

Background: Carpal tunnel syndrome (CTS) is the only known early clinical manifestation of wild-type transthyretin amyloidosis (ATTRwt; formerly known as senile systemic amyloidosis) which causes an amyloid cardiomyopathy. At the UK National Amyloidosis Centre 98% of those with proven ATTRwt have evidence of median nerve entrapment on neurophysiological studies and 48% have a history of carpal tunnel decompression as much as 12 years prior to heart failure symptoms. ATTRwt is diagnosed in approximately 150 individuals in the UK each year although post-mortem studies suggest presence of ATTwt amyloid deposits 30% of males over 80 years (yrs)[1]. A novel bone tracer, Technetium-3,3-diphosphono-1,2-propanodicarboxylic acid (99m) (Tc-DPD) largely abrogates the need for cardiac biopsy, identifying cardiac ATTR amyloidosis with a sensitivity of 98% and specificity of 70%[2]. Amyloid deposition can be readily identified by Congo red staining of carpal tunnel biopsies taken at routine decompression surgery. Immunohistochemistry (IHC) is usually able to determine the amyloid fibril protein (amyloid type). Rheumatologists are ideally placed to request CT biopsy. Developing this underused but diagnostic test is of particular importance in light of emerging therapies for ATTR amyloidosis.
Objectives: To determine the utility of CT biopsy as a diagnostic tool in systemic ATTR amyloidosis, and its utility in combination with Tc-DPD scintigraphy in identifying pre-clinical cardiac amyloidosis.
Methods: CT biopsies were taken at decompression surgery. Biopsies were stained with Congo red and viewed under cross polarised light. IHC was used to type amyloid deposits using standardised techniques.
Results: We analysed 37 CT biopsies, 73% female, median age 65.8 yrs (35–87 yrs). 5 biopsies contained amyloid deposits (13.5%) by Congo red staining. 3 were typed as ATTR amyloid using immunohistochemistry (8%), median age 80.35 yrs. The amyloid type could not be determined by IHC in two cases. No cases of proven ATTR amyloid had a history of heart failure symptoms. Of these, a 74 yr old male attended the NAC for diagnostic work up. He had a normal ECG and Echocardiogram, however, Tc-DPD scintigraphy was able to demonstrate low grade uptake.
Conclusions: Carpal tunnel biopsy can readily identify ATTR amyloid deposition and may identify those at risk of developing cardiac ATTR amyloidosis in the future, permitting earlier intervention with novel therapeutics aimed at preventing accumulation of amyloid. This ongoing study aims to identify the UK prevalence of ATTR amyloid in those with carpal tunnel syndrome and to create a cohort of those who may develop systemic ATTR amyloidosis to further elucidate the disease natural history.

AB1065 NEEDLE VERSUS FORCEPS TECHNIQUE IN ULTRASOUND-GUIDED SYNOVIAL BIOPSY OF THE KNEE JOINT

T. Hügle[1], P. Urbaniak[1], M. Müller-Gerbl[2], C. Marx[3], G. Tamborrini[3].
[1]Department of Rheumatology, University Hospital Basel; [2]Institute of Anatomy, University Basel; [3]Ultrasound Center Rheumatology, Basel, Switzerland

Background: Ultrasound-guided synovial biopsy is increasingly applied in rheumatology. Usually forceps- or needle-based techniques are used. So far there has been no direct comparison of different devices regarding their suitability in high resolution musculoskeletal ultrasound (hrMSUS)-guided synovial biopsy.

Objectives: To compare different forceps and needle-based instruments in hrMSUS-guided synovial biopsy in a cadaver study.
Methods: A core needle biopsy (A, Quickcore, Cook Medical, Bloomington, IN, USA), a retrograde forceps (B, Retroforce, Karl-Storz GmbH Tuttlingen, Germany), an anterograde arthroscopy forceps (C, Karl Storz GmbH, Tuttlingen, Germany) and an convexly shaped integrated core needle system (D, Synovex, Hipp Medical, Kolbingen, Germany) were tested for ultrasound-guided synovial biopsy of the suprapatellar recess in cadaver knee joints. Four senior rheumatologists scored each intervention from 0–5 regarding the following characteristics: visualization, handiness, accuracy, synovial tissue yield, invasiveness and overall suitability. Each intervention was recorded as static images and video clips.
Results: In all devices, enough representative synovial tissue was obtained and the instruments were all well visualized by hrMSUS. Core needle biopsy and the integrated needle system were best visualized due to their horizontally shaped closing mechanism. The core needle obtained a high yield of superficial synovial tissue and was the least invasive procedure. Despite handiness and accuracy were higher in the forceps instruments, overall suitability for hrMSUS-guided synovial biopsy was rated highest for the core biopsy needle.
Conclusions: Technically, all of the tested devices can be used for hrMSUS-guided synovial biopsy. Core needle biopsy seems to be most suitable for this intervention due to a low invasiveness, good visualisation and optimal yield of superficial synovial tissue.

AB1066 DIAGNOSTIC UTILITY OF THE MEDIAN/ULNAR NERVE CROSS-SECTIONAL AREA RATIO IN CARPAL TUNNEL SYNDROME

T. Atan[1], Z. Günendi[2]. *[1]Physical Medicine and Rehabilitation, Hitit University, Çorum Training and Research Hospital, Çorum; [2]Physical Medicine and Rehabilitation, Gazi University Faculty of Medicine, Ankara, Turkey*

Background: The most commonly used ultrasonographic measurements for the diagnosis of CTS are measurement of the median nerve cross-sectional area (m-CSA) at different levels of the carpal tunnel.[1] The cross-sectional area of a nerve may differ according to biometric characteristics such as age, sex, height, weight and wrist thickness.[2–4]
Objectives: The aim of this study was to assess the diagnostic utility of the ultrasonographic ratio of m-CSA to ulnar nerve cross-sectional area (u-CSA), the m-CSA/ u-CSA ratio, in carpal tunnel syndrome (CTS).
Methods: Patients (n=50) with positive symptoms and electromyography results of CTS and control subjects (n=50) with negative electromyography results of CTS were evaluated. The most symptomatic hand of each participant were included in the assesment. Ultrasonographic m-CSA and u-CSA measurements were made at the level of the pisiform bone, and m-CSA/u-CSA ratio was calculated.
Results: Using the m-CSA cut-off value of 9.95 mm^2 showed a sensitivity of 92% and a specificity of 42%. Conversely, the cut-off value 13.90 mm^2 showed a sensitivity of 56% and a specificity of 92%. Using the cut-off value 2.96 for the ratio of m-CSA/u-CSA showed a sensitivity of 86% and a specificity of 38% while using the cut-off value 3.71 showed a sensitivity of 52% and a specificity of 90% in the diagnosis of CTS.
Conclusions: The ratio of m-CSA/u-CSA at the level of the pisiform bone did not provide an additional benefit for the diagnosis of CTS. Ultrasonographic m-CSA measured at the same level was found to be more sensitive and specific method.

AB1067 SUITABILITY OF CADAVER MODELS IN ULTRASOUND DIAGNOSTICS AND INTERVENTIONS IN RHEUMATOLOGY: FOOT AND ANKLE

V. Halász[1], Á. Nemeskéri[1], D. Bong[2], P. Mandl[3], I. Möller[2], E. Naredo[4], P.V. Bálint[5] on behalf of EULAR Anatomy for the Image Study Group. *[1]Department of Anatomy, Histology and Embriology, Semmelweis University, Budapest, Hungary; [2]Department of Rheumatology, Instituto Poal de Reumatologia, Barcelona, Spain; [3]Division of Rheumatology, Medical University of Vienna, Vienna, Austria; [4]Department of Rheumatology, Hospital Universitario Fundación Jiménez Díaz and Autónoma University, Madrid, Spain; [5]3rd Department of Rheumatology, National Institute of Rheumatology and Physiotherapy, Budapest, Hungary*

Background: Employment of cadaver specimens in ultrasonography provides a useful and safe model for education, enhances the anatomical knowledge of sonographers and may help determine the accuracy of ultrasound-guided interventions.
Objectives: In this systemic literature review (SLR) we assessed the role and use of cadaver specimens in sonographic studies of the foot and ankle in the field of rheumatology.
Methods: For our literature review we utilized the MEDLINE database, which were supplemented by searches in Google Scholar and Science Direct when the articles were not available through PubMed. Original studies in English language were included in the full paper review with an exception of three German language studies with English abstracts were also included. In the full paper review studies were selected for inclusion featured the sonographic study of cadaver specimens of the foot and ankle. Data were extracted on study characteristics and interventions.
Results: The search yielded 1241 articles, of which 130 were selected for detailed review. In the end, 23 full papers met inclusion criteria. The studies could be grouped as follows: description of detailed ultrasound anatomy (9), testing of accuracy of ultrasound guided interventional procedures (8), examination of artificial tears and lesions (4), foreign bodies (1) and joint effusions (1). The results that were obtained in the studies of the fully reviewed papers utilized a total of 294 cadaveric specimens, with an average of 12.78 (range: 1–48) cadaveric specimens included in each study.
Conclusions: The use of cadaver specimens of the foot and ankle may facilitate the validation of new sonographic methods which assess these joint regions, however the major disadvantage of these studies was the low number of cadaveric specimens.

AB1068 ULTRASOUND OF SALIVARY GLANDS IN SJOGREN'S SYNDROME- WHICH SEMI-QUANTITATIVE SCORING SYSTEM IS THE BEST?

V.C. Iorgoveanu[1], V. Bojinca[2], V. Vlad[3], D. Mazilu[4], I. Saulescu[2], L. Groseanu[2], D. Opris[2], A. Balanescu[2], C. Constantinescu[2], D. Predeteanu[2], R. Ionescu[2]. *[1]Rheumatology, Carol Davila University of Medicine and Pharmacy; [2]Rheumatology, Saint Mary Clinical Hospital, UMF Carol Davila; [3]Rheumatology, Saint Mary Clinical Hospital; [4]Saint Mary Clinical Hospital, UMF Carol Davila, Bucharest, Romania*

Background: Sjogren Syndrome (SS) affects mainly exocrine glands. The latest diagnostic criteria designed for clinical studies are also used as guidance in clinical practice [1].
Ultrasonography (US) demonstrates specificity and sensibility in parotid and submandibular gland evaluation (SG). Parameters considered are echogenicity, homogeneity and margins regularity [1,2,3]. To standardize the assessment of B mode US of SG, different semi-quantitative scores were proposed.
Objectives: To apply and compare 9 US semi-quatitative scoring systems in B mode scanning of salivary glands in Sjogren Syndrome.
Methods: A research using keywords "salivary glands", "ultrasonograpy", "Sjogren Syndrome", "semi-quantitative score" in Medline/Pubmed was performed. There was a selection of most relevant articles. There were not considered relevant publications with impact factor <1. We performed the examination on SG in B mode US and applied these scores (De Vita, Niemela, Hocevar, Salaffi, Yukinori, Cornec,Theander) to our patients (primary and secondary SS).
Results: Eighty four SG in patients diagnosed with primary and secondary (57.15%) SS were assessed. In the group of patients with SSA/SSB presence (85.7%), mean score was De Vita 1.78+/-1.21, Niemela 2.56+/-2.17, Hocevar and Wernicke 2.39+/-2.14, Salaffi 2.83+/-2.52, Yukinori 2.39+/-2.14, Milic 3.39+/-2.14, Cornec 1.78+/-1.215, Theander 1.28+/-0.752. Schirmer test and the need for using the artificial tears was correlated to SG alterations in scoring systems proposed by Niemela (r 0.465, $p<0.05$) and Salaffi (r 0.496, $p<0.02$). All scoring systems were strongly correlated between them ($r>0.8$, $p<0.01$).
Conclusions: Inhomogeneity of parenchyma was considered in all scoring systems. Others considered relevant glandular dimension and margins regularity [2,3.4]. There was no difference between the scoring systems. Xeroftalmia valided through Schirmer test is correlated to SG parenchymal alterations. Our data is an update about semi-quantitative scoring systems in US of SG in SS.

AB1069 SHOULDER ULTRASONOGRAPHY IN DIABETIC PATIENTS – IS THERE DAMAGE WITH NO CLINICAL SIGN?

V.C. Iorgoveanu[1], V. Bojinca[2], R. Malitchi[2], M. Gheorghe[2], C. Ionescu[2], R. Ionescu[2]. *[1]Rheumatology, Carol Davila University of Medicine and Pharmacy; [2]Rheumatology, Saint Mary Clinical Hospital, UMF Carol Davila, Bucharest, Romania*

Background: Degenerative lesions in shoulder rises exponentialy with age and diabetes was found to be associated with shoulder pain [1,2].
Objectives: To evaluate the prevalence and type of lesions of shoulder in diabetic patients with no pain using ultrasound (US).
Methods: We included consecutive patients with diabetes with no pain or clinical tumefaction in shoulder. US was performed in both shoulders using the standard scanning planes and dynamic maneuvers. Clinical data as fasting glycemia, BMI, treatment were recorded.
Results: Forty two shoulders were examined in 21 consecutive patients (mean age 67.92+/-7.35 years, weight 81.75 +/- 13.57 kg, BMI 25+/-2 kg/m^2, fasting glycemia 151.85+/-33.72mg/dl) with diabetes diagnosis mean 5.33 years +/- 5.99. Majority of patients were under treatment with oral antidiabetics (58.3%). Degenerative lesions were found in subscapular (SSc) 33.3% and supraspinatus (SpS) 8.3%) tendons as well as intratendinous micro ruptures with calcifications (33.3% bilateral calcifications in SSc, SpS). Impingement syndrome was objectified in 16.6% of examinations. Minimal inflammatory signs as: sub-acromion sub deltoidian bursitis in 50% (minimum in 33.3%, 8.3% bilateral) and long head biceps tenosynovitis in 58.33% (8.3% minimal Doppler signal). 83.3% showed humeral irregularities and also erosions were found (8.3%).
Conclusions: Degenerative and minimal inflammatory lesions in shoulder of diabetic patients exist with no clinical sign (pain, tumefaction). Ultrasonography might be an usefull technique to confirm these alterations before the appearance of symptoms.

AB1070 UNRAVELLING AUTOIMMUNE DISEASES THROUGH NAILFOLD CAPILLAROSCOPY

V.R. Bernardino[1,2], A.C. Rodrigues[1,2], A.C. Llado[1,2], M.A. Fernandes[1,2], M. Vicente[1,2], A.C. Grilo[2,3], A. Panarra[1,2], M.F. Moraes-Fontes[1,2]. *[1]Unidade de Doenças Auto-imunes/Medicina 7.2, Hospital de Curry Cabral, Centro Hospitalar de Lisboa Central; [2]NEDAI/SPMI – Núcleo de Estudos de Doenças Autoimunes, Sociedade Portuguesa de Medicina Interna, Lisbon; [3]Serviço de Medicina Interna, Hospital Beatriz Ângelo, Loures, Portugal*

Background: Nailfold capillaroscopy (NC) is non-invasive and used by clinicians as a diagnostic tool. It allows the distinction between primary and secondary Raynaud Phenomenon (RP), the latter usually associated to autoimmune diseases (AID).
Objectives: Characterize the utility of NC assessment for diagnosis of AID and to evaluate main differences in NC pattern, according to the presence of RP.
Methods: NC were performed with a Videocap biomicroscope using well established classification criteria [1]. NC images and reports from all patients evaluated from January 2011 to final December 2016 were retrospectively analysed. Comparisons were made using the Wilcoxon Rank Sum and Chi square tests, p values of $<$0,05 were considered statistically significant.
Results: In the last 6 years, 1100 NC were performed, 159 to man and 941 to women. Mean age was 42 [±19] years. NC requests came from 17 different hospital units. RP was present in 83% of patients (RP+, n=909) of whom 71% (n=641) had a prior diagnosis of AID, most frequently Systemic Sclerosis (SSc) (24%, n=143), Systemic Lupus Erythematosus (SLE) (21%, n=123), Sjögren's Syndrome (SS) (10%, n=62), Mixed Connective Tissue Disease (MCTD) (9%, n=52) and Antiphospholipid Syndrome (APS) (8%, n=48). NC patterns allowed for the classification of RP+ subjects into primary (3%) and secondary (81%); in 4% of subjects NC findings were abnormal but inconclusive. From secondary RP, scleroderma (37%) and non-scleroderma pattern (62%) were further separated; the former was later classified according to scleroderma-like (15,02%), early (33%), active (38%) and late (15%) scleroderma patterns.29% of RP+ patients did not have AID diagnosed; NC disclosed the diagnosis of SSc (n=24), APS (n=5), SS (n=4), SLE (n=2), MCTD (n=1), overlapping syndrome (n=1) and paraneoplastic syndrome (n=1).
In RP- patients, the main diagnosed AID were SLE (20%, n=17), SSc (14%, n=12) and SS (8%, n=7). NC results in RP- subjects were normal (24%) (including 92% of controls), inconclusive (22%) and suggestive of capillaritis (16%). Although RP-, some patients (38%) presented dysmorphic capillaries suggestive of secondary involvement (38%); NC findings in these patients included megacapillaries and microhemorrhages (scleroderma-like (26%), early (41%), active (30%) and late (7%)).
Demographic data was similar in both groups. Statistically significantly higher frequencies of AID ($p<0.0001$), SSc ($p=0.0006$), NC secondary non-SSc pattern ($p<0.0001$) and NC secondary active SSc pattern ($p=0.002$) were found in RP+ patients.
Conclusions: NC findings in RP+ were more pathological than in RP-subjects, probably due to pre-existing AID and more frequent positivity. Secondary non scleroderma pattern was more prevalent in RP+ patients. In RP- group, almost a quarter of NC assessments were normal, but capillary abnormalities were also revealed, suggesting this diagnostic approach can help to disclosure microvascular disease, even if RP is absent. NC further disclosed important leads to diagnose SSc, APS and MCTD in our population.

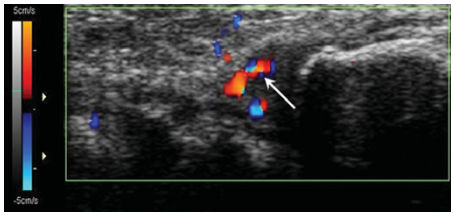
AB1071 SIMPLIFIED ASSESSMENT IN NAILFOLD CAPILLAROSCOPY IN RHEUMATOLOGY

V. Durigan, G. Calizaya, A. Secco, F.E. Romanini, M.L. Sormani de Fonseca, V. Ortiz, M. Uemura, L. Takashima, M. Mamani. *Rivadavia, CABA, Argentina*



Background: Nailfold Capillaroscopy is a non-invasive diagnostic technique designed to evaluate small vessels of the microcirculation. The most important indication for capillaroscopy is Raynaud's phenomenon. The complexity and meticulous evaluation of the eight fingers is difficult to apply in daily practice given the limited availability of time to perform. For this reason it is necessary to develop simple and abbreviated techniques, to achieve an optimal and rapid evaluation of the patient.
Objectives: Determine the performance of the method of the 4° finger for the diagnosis of SD pattern in patients with Raynaud's Phenomenon taking the eight finger pattern as a gold standard.
Methods: Cross-sectional study with blinded and independent measurements. Nailfold Capillaroscopy was performed on the four fingers of each hand, except thumbs. Another observer evaluated the 4th finger of the hands. The interobserver agreement was made before carrying out the study and was 100%. The 8-finger method (gold standard) was considered positive when at least one finger has SD pattern and the 4° finger method was considered positive when at least one of them presents the SD pattern. We included patients older than 18 years with a diagnosis of Raynaud Phenomenon. Patients with thickening of the skin in the nailfold, digital lesion that made it difficult to assess (trauma, amputation, burns, etc.) and patients who did not consent to the procedure were excluded.
Results: We included 78 patients, 90% was female. The mean age was 53 years (DS +/- 13.5). Sixty-three patients had a score of eight fingers positive (cases) and 15 had a score of eight fingers negative (controls). The sensitivity of the 4° finger evaluation method was 89% (95% CI: 82–96%) and 93% specificity (95% CI: 88–99%). The positive predictive value of this method was 98% (95% CI: 95–100%) and the negative predictive value was 67% (95% CI: 56–77%). The positive likelihood ratio was 13 (95% CI: 2–89).
Conclusions: The simplified method of the 4° finger showed good performance for the diagnosis of SD pattern compared to the standard method of evaluation of the 8 fingers.

AB1072 THE DEVELOPMENT OF ULTRASOUND SEMIOTICS OF DEFEATS OF THE JOINTS IN RHEUMATOID ARTHRITIS

V. Sirotka[1,1], U. Sirotka[2], A. Litvyakov[1]. [1]*Department of Internal Diseases No. 1;* [2]*Department of Traumatology, Vitebsk State Medical University, VITEBSK, Belarus*

Background: Differential diagnosis of rheumatoid arthritis today is challenging in cases of atypical clinical and laboratory picture arthritis [1]. Often the use of standard x-ray is not informative for the first two years of the disease. Erosive joint damage detected by the standard X-ray only after 2 years from the onset of the disease and only 36% of cases (M. Bukhari [et al., 2001), while the degree of articular destruction progresses with time and is correlated with a decrease in joint function.
Objectives: Development ultrasound semiotics for the diagnosis of rheumatoid arthritis using ultrasonic method of investigation of the joints.
Methods: We studied 113 patients with RA and 30 with no articular pathology – a control group (CG).
In the group of patients with RA - 88 people were women (79,7%), 35 people (20,3%) were men; the median age was 40.3 years (33–46), and the median duration of current RA – 4 years (1,75–10).
The diagnosis of RA was established according to modified ACR criteria of 1987. The activity of the inflammatory process of the I degree was 19 (27,5%) patients, II – 36 (52,2%), III in 14 (20.3%).
The control group was the patients medical history and clinically at the time of inspection there was no symptoms of the joints. Among them 15 men (50%) and 15 women (50%). The median age in the CG was 38.5 years (33–48).
All patients were multiplescale dynamic study II, V metacarpophalangeal and wrist joints by the ultrasonic device expert class using a sensor with a frequency of 12 MHz.
Results: Patients from the control group by ultrasound examination of the joints, we visualized the articular surfaces of the bones in the form of hyperechoic structures with clear smooth contours, homogeneous echostructure; the synovium is not visualised or she had homogeneous echostructure and a thickness of not more than 2.9 mm; the tendon was determined in the form of a hyperechogenic bundle, of a thickness not exceeding 1.5 mm.
Patients with RA identified the following ultrasound signs of lesions of the joints: focal pannus (96,6%) - area of pathologically altered synovial membrane thickness of more than 3 mm with a "tumor-like" invasive growth and the presence of pathological vascularization (indirect signs of neoangiogenesis) detected when using Doppler on the erosion pannus; thinning synovia outside erosion (99%); erosion, pannus (99%); combined erosion (96%); the erosion of inflammation: acute (45.6%) and chronic (89%); moderate synovitis (89,4%); swelling of periarticular soft tissues (88,4%); tenosynovitis (67,6%); periarticular effusion (66,9%); positive "pain test" in 6% of cases under ultrasound control.

Conclusions: Given the results obtained, we have developed ultrasonic diagnostic criteria of RA.
Diagnostic criteria for rheumatoid arthritis:
1. Pannus with pathological vascularization;
2. Thinning synovia outside of the pannus;
3. Erosion of the articular surface of the bone (pannus, associated erosion/erosion inflammation);
4. Moderate synovitis;
5. Tenosynovitis;
6. Periarticular swelling/effusion.

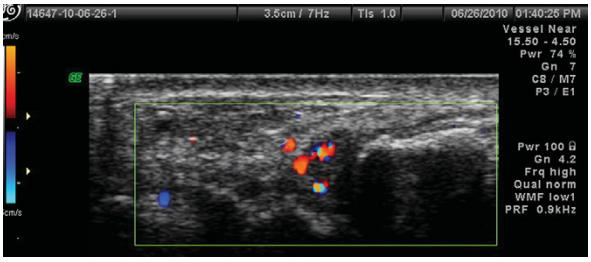
AB1073 D-DIMER AS AN EARLY MARKER IN PATIENTS WITH LUPUS MESENTERIC VASCULITIS

X. Ma, X. Feng, H. Wang, B. Hua, L. Sun. *Rheumatology, Drum Tower Hospital, Nanjing University School of Medicine, Nanjing, China*



Background: Gastrointestinal manifestations are common in systemic lupus erythematosus (SLE) patients. Lupus mesenteric vasculitis (LMV) is a major cause of acute abdominal pain in SLE patients. No early serum marker contributes to the diagnosis of lupus mesenteric vasculitis.
Objectives: The aim of this study was to investigate clinical significance of serum D-dimer level as an early diagnosis marker of LMV patients.
Methods: The 57 systemic lupus erythematosus patients were retrospectively analyzed and classified into LMV group (n=19) and Non-LMV group (n=38) between May 2010 and January 2016. The serum D-dimer level was measured on the first day after SLE patients presented acute abdomen as well as imaging, other laboratory-testing parameters, and SLEDAI during the same period. The maximum and mean D-dimer values were analyzed and compared with other potential markers for diagnosis of LMV. The correlation of D-dimer level with other potential severity markers and inflammation parameters were also studied.
Results: Both maximum and mean D-dimer level on the first day of presentation of acute abdomen were significantly higher in LMV patients. The D-dimer level was correlated well with L-lactate and SLEDAI. In addition, D-dimer level was detected poor correlation with white blood cell count and C-reactive protein level.
Conclusions: D-dimer level could be an effective and early serum diagnosis marker of LMV.

AB1074 THE TYPES OF EROSIVE LESIONS OF JOINTS IN RHEUMATOID ARTHRITIS

V. Sirotka[1], U. Sirotka[2], A. Litvyakov[1]. [1]*Dept. of Internal Diseases No. 1, Vitebsk State Medical University, VITEBSK;* [2]*Dept. of Traumatology, Orthopedics and Military Field Surgery, Vitesbek State Medical University, Vitesbek, Belarus*

Background: Early diagnosis of erosive lesions in rheumatoid arthritis (RA) remains today an important task, especially in the absence of specific laboratory markers. Promising research aimed at studying the informative instrumental diagnostic methods (ultrasound, Rg, MRI) to identify the characteristics of erosive joint damage in patients with RA [1].
Objectives: To study diagnostic possibilities of instrumental methods to identify the species of erosive joint damage in patients with RA.
Methods: We examined 104 patients with RA. Among patients of the 1st group were women 81 (77.9%), men - 23 (22,1%), average age was 38±12.1 years. Diagnosis of rheumatoid arthritis was exhibited with the EULAR diagnostic criteria [2] and the ACR [3]. All patients were Rg-graphy, ultrasound and MRI of the hands. Statistical processing of the information package.
Results: Erosive lesion of joints at RA is presented by the proliferation-caused erosion (erosion of the pannus) in combination with the development of the focal pannus with vascularization and inflammatory-destructive erosion (true erosion inflammation) outside the pannus (image 1). In the study the true erosion of inflammation of the articular surface of the bone ultrasound method identified at 87.9% of the joints in RA, significantly higher ($p<0,0001$) than in 34% of the joints in Rg-study; erosion pannus identified in 99.2% of the joints in patients with RA by means of ultrasonography, was significantly higher ($p<0,0001$) than 24.3% of the joints in the Rg-study. So erosion from the focal invasive growth of pannus, associated erosion, erosion, acute and chronic inflammation of the articular surface of the bone in patients with RA by ultrasonography were visualized significantly more often ($p<0,0001$) than in Rg, which allowed to define only the fact of presence of erosive lesions of the joints, but not allowed to determine the erosive lesions. The sensitivity of ultrasound accounted for 97.9% (95% CI: 97,7–98,1%); specificity - of 95.7% (95% CI: of 95.5–95.9 per cent). And in Rtg-graphy sensitivity accounted for 55.3% (95% CI: 54,8–55,8%); the specificity - of 87.7% (95% CI: 87,4–88%).

Conclusions: When comparing the results of a comprehensive study of joints in patients with RA despite the fact that Rg and MRI allow us to visualize and measure bone structure and pathology, ultrasound is only allowed to identify two types of erosive lesions of the joints: the true erosion inflammation and erosion of the pannus.

Public health, health services research and health economics

AB1075 PHYSICIAN POSTGRADUATE EXPERIENCE HAS A PREDICTIVE ROLE FOR PHYSICIAN EFFICIENCY INDEX REGARDING PATIENTS WITH RHEUMATOID ARTHRITIS: A COHORT, EXPLORATORY STUDY

A. Emamifar[1], S.M. Mousavi[1], I.M. Jensen Hansen[1,2]. *[1]Rheumatology, Svendborg Hospital, Odense University Hospital, Svendborg; [2]DANBIO, Copenhagen, Denmark*

Background: Much effort has been made to improve the efficiency of health care system by delivering cost-effective, high-quality care.Nurse staffing's contribution to daily practice plays a significant role to reach this goal.[1]
Objectives: To elucidate the differences between ratios of nurse/physician consultation as well as physician efficiency index (PEI) of senior rheumatologists and junior physicians in rheumatology residency training regarding patients with Rheumatoid Arthritis (RA).In addition, to delineate the correlation of physician postgraduate experience and PEI.
Methods: The mean intervals between standard consultation by a physician or nurse for all senior rheumatologists and junior physicians as well as nurse/physician visits ratio and PEI (= nurse/physician visits ratio * mean interval), regrading RA patients seen during Nov 2013–2015, were calculated. Multiple linear regression analysis was performed to delineate the relationship between physician postgraduate experience and PEI. To monitor treatment outcome, Disease Activity Score in 28 joints-C-reactive Protein (DAS28-CRP) and Health Assessment Questionnaire (HAQ) were consecutively measured three times: first at physician consultation, second at following nurse consultation and third either at a nurse or physician consultation.

Table 1

Physicians	Number of patients**	DAS28 at baseline	Interval (day) ±SD	Nurse/Physician visits ratio	Physician efficiency index	Physician postgraduate experience (year)
P1*	244	4.8±1.2	126.9±85.1	(604/617)0.98	124.2	29
P2*	183	4.4±1.2	133.1±105.3	(207/384)0.54	71.7	20
P3*	129	4.5±1.3	114.5±85.2	(96/309)0.31	35.6	11
P4*	97	4.4±1.0	84.8±83.3	(133/252)0.53	44.8	10
P5	37	3.8±1.2	118.5±78.4	(15/52)0.29	34.2	9
P6	51	4.3±1.2	138±102	(5/68)0.07	10.1	8
P7	60	4.4±1.4	194.2±86.3	(14/103)0.14	26.4	8
P8	29	4.4±1.3	114.8±78.4	(14/41)0.34	39.2	7
P9	39	4.1±1.2	159.2±105.5	(14/53)0.26	42.0	7
P10	15	4.6±1.4	179.1±115.1	(1/16)0.06	11.2	6
P11	25	4.2±1.2	0	(0/24)0	–	3

P1–P4*: Specialists in rheumatology (n=4), P5–P11: junior physicians in rheumatology residency training (n=7). **Some of patients had consultation with more than one physician. DAS28:Disease Activity Score in 28 joints.

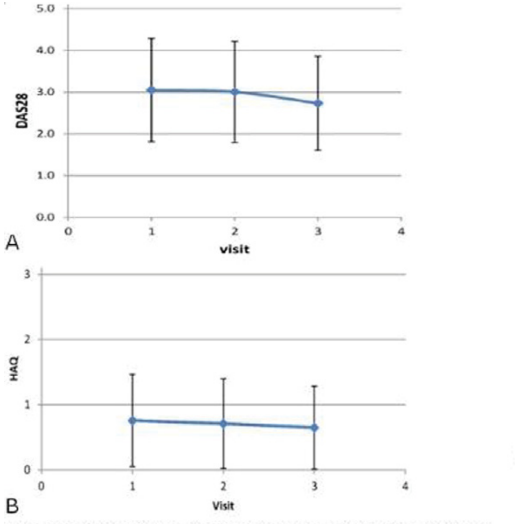

Fig 1. A: Curve of the means of Disease Activity Score in 28 joints ± Standard Deviation at first (by physicians, 3.05±1.24), second (by nurses, 3.01±1.21) and third (by physician or nurse, 2,73±1.13) visits and B: Curve of the means of Health Assessment Questionnaire scores ± Standard Deviation at first (by physicians, 0.759±0.707), second (by nurses, 0.709±0.686) and third (by physician or nurse, 0.649±0.634) visits.

Results: 3699 visits, belonged to 672 RA patients (64.1% female, the mean of age 64.9±14.1 and DAS28 at baseline 4.5±1.2), were included. There was a significant difference between the nurse/physician visits ratios of senior rheumatologists and junior physicians (P=0.01). Additionally, the mean PEI of senior rheumatologists was significantly higher than of junior physicians (P=0.04) (Table 1). A positive correlation was found between physician postgraduate experience and PEI adjusted for DAS28 at baseline and number of patients for each physician (Regression coefficient (95% Confidence Interval): 5.427 (1.068–9.787), P=0.022). DAS28 and HAQ score were significantly decreased if physician visits were followed by nurse visits (P=0.004 for DAS28 and P=0.025 for HAQ) (Fig.1), indicating a good treatment outcome at nurse consultations.
Conclusions: Junior physicians should be supervised to delegate responsibilities to nurse staffing. So, entire department operates more efficient, leading to prevent extra expenses (due to the differences in yearly salary of physicians and nurses). Quality of care should be monitored continuously by markers of disease activity and CRP.

AB1076 LOW BACK PAIN IN TURKISH BUS DRIVERS: PILOT STUDY

Z.B. Karakoc[1], Z. Sarı[1], F. Koroglu[2], M. Aamir RashediBonab[3], S. Karakas[4], B. Kapşigay[1]. *[1]Physiotherapy and Rehabilitation, Marmara University Health Science Institute, Istanbul; [2]Physiotherapy and Rehabilitation, Yalova University, Termal Vocational School of Higher Education, Yalova; [3]Physiotherapy and Rehabilitation, Goztepe Medical Park Hospital; [4]Physiotherapy and Rehabilitation, Goztepe Training and ResearchHospital, Istanbul, Turkey*

Background: Lowback pain is a common problem whichincreasefinancialburden of government (1).The incidence of back pain that can be seen in every part of society is also high in drivers (2). We haven't seen any investigation about low back pain of Turkish drivers in literature. We thought that it should be research because of changeable ethnic differences.
Objectives: The aim of our study was to determine the rate of lowback pain and it'srelationshipbetweenquality of life in drivers.
Methods: Intercity and municipalitydriversof Istanbul and Yalova, participated in our study.Itwasdesigned as cross-sectional and complementarytype. Inclusion-criteriawerevolunteerforthis study and driving at least eight hours per day, being a driver for at least three years. Those with congenital deformities, having an accident history and doing an additional job were excluded from this study. After getting drivers' demographic data, "Oswestry Low Back Disability Questionnaire" forlowback pain and "Nottingham Health Profile" forhealthquality of life weresurveyedface to face. Chi-square and Spearman'scorelationnon-parametric test in the SPSS statistics programwereusedforstatistical analysis in this study.
Results: All of the 261 people who participated in this study were male. Their mean of age, weekly working hours and working year were 43±9.28, 50±13.09 and 18±1.04, respectively. %50 of participantshavelowback pain and those of 43%reported that jobsatisfactionwasaffecteddue to pain. Itwasdetermined that 10% of participants, whosejobsatisfactionwereaffected, didn't tapply the medical-doctor. While there was a significant relationship between low back pain and quality of life (p=0.000); there was no relationship between these two parameters and age and working year (p>0.05). It was determined that applying to medical doctor (p=0.02) and drug use rate (p=0.015) increased if the painful period lasted longer.
Conclusions: Low back pain affects quality of life related to health status. In this study, it was seen that the incidence of low back pain was high in long-distance drivers and affected job satisfaction in a great way. We think that the rates of drug use and medication usage can be reduced by increasing leisure time activity before increasing the severity of back pain and lengthening painful period. In addition, half of this occupation group is influenced by low back pain and once again it has been shown that waist schools should be expanded in our country.

AB1077 DOES PRECONSULT ELECTRONIC EXCHANGE AFFECT POSTCONSULT DIAGNOSIS?

G. Miller[1], B. Chou[1], N. Patel[2], G. Karpouzas[1]. [1]*Division of Rheumatology;* [2]*Department of Internal Medicine, Harbor UCLA Medical Center, Torrance, CA, United States*

Background: Harbor UCLA is an urban safety-net hospital in Los Angeles for underserved patients. In 2014, LA County Department of Health Services adopted an electronic consultation (E-consult) referral and dialogue system to improve access to subspecialists in the ambulatory care setting. The E-Consult system provides a platform for primary care providers to ask questions or engage in dialogue with specialists, request consultation, and track submitted requests. Back and forth messaging prior to acceptance for face-to-face consultation is termed a "preconsult exchange".
Prior studies of E-Consult systems have suggested benefits which include a reduction in wait times compared to paper referrals[1] and a perceived improvement in patient care[2]. We sought to further clarify the effect of a preconsult exchange versus immediate booking on a patient's diagnosis and wait time in an effort to provide some guidance on whether E-Consult should be used as a screening tool to reduce unnecessary visits or as a communication method to clarify details before a face-to-face visit.
Objectives: To determine whether preconsult exchange:
1. Influences the odds of arriving at a different diagnosis after face-to-face consultation compared to the requesting provider's original diagnosis
2. Influences the odds of arriving at a diagnosis of a different autoimmune condition versus a non-autoimmune condition (fibromyalgia, primary osteoarthritis, chronic pain, or other non-rheumatologic condition)
3. Results in a significant delay in face-to-face evaluation
Methods: We performed a retrospective chart review of all 238 new patient referrals between 11/2014 and 5/2016 to the Harbor UCLA Rheumatology clinic generated through the E-Consult system, reviewed by BC or GM, deemed appropriate, and seen for face-to-face evaluation. These patients were grouped by exposure (Preconsult exchange or not). Odds of change in diagnosis and confidence intervals were calculated using 2x2 contingency tables and Chi-Square tests. A student's T test was used to compare mean number of days between E-Consult initiation and face-to-face appointment.

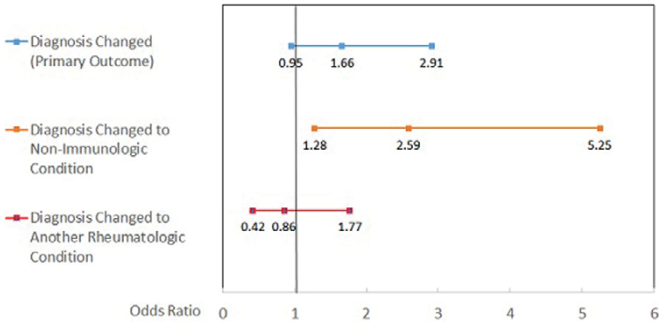

Figure 1. Odds of Change in Diagnosis Following a Preconsult Exchange

Conclusions: There was a trend towards a change in diagnosis overall among patients for whom there was a preconsult exchange, but a statistically significant increase in odds for change to non-immunologic diagnoses. This suggests that preconsult exchange highlights those patients for whom there is a higher likelihood of a non-immunologic diagnosis.
However, preconsult exchange was associated with a significant time cost - an additional 26 day delay for a face-to-face visit (due to the time needed for both submitter and reviewer to complete their dialogue) in comparison to an immediately booked patient.

AB1078 IMPACT OF PRE-SCREENING ON RHEUMATOLOGY OUTPATIENT CLINIC PRACTICE

C. Orr, O. McElvaney, M. McQuillan, M. Hussein, S. Donnelly, G. McCarthy, C. McCarthy. *Rheumatology, Mater Misericordiae University Hospital, Dublin, Ireland*

Background: Chronic rheumatological diseases are predominantly managed in an outpatient setting, and these out patient clinics constitute a significant workload for rheumatolgy clinicicians. When unnecessary outpatient visits occur, service provision to those most in need of rheumatology review, both new referrals and those with established diagnoses in need of urgent review, is compromised. There is an evidence base for such screening in secondary care centres from other internal medicine disciplines (1).
Objectives: To determine the impact of introducing pre-clinic screening, and exploring the potential for follow up using telephone, by a physician extender (PE), on attendances at a rheumatology outpatient department.
Methods: A retrospective chart review of all patients attending a rheumatology outpatient clinic was performed over a 4-week period, 15/08/2016- 09/09/2016. Patients were categorized into new or follow-up attendees and the follow-up patients were further subcategorized into 1 of 4 groups:
A) Attending to receive results of investigations requiring no further treatment;
B) Attending with a chronic rheumatological disease requiring no active change in management;
C) Attending to receive results of investigations requiring further treatment;
D) Attending with a chronic rheumatological disease requiring active change in management.
Patients in categories A and B, may be safely managed by a phone call from a physician, or PE. Those in C and D would need to be reviewed in clinic, following triage by phone using a PE.
Results: 232 subjects were included (5 category A, 118 category B, 4 category C, 105 category D). 123 (53.0%) could be managed by phone utilizing a PE, thus obviating the need for review in clinic. The remaining patients could be triaged by telephone by a PE, and the schedule for review adjusted to prioritise those most in need of review. It is likely that such a strategy for reviewing patients would be more clinically efficient, have a greater impact on patient well-being, and be cost-saving.
Conclusions: Routine pre-screening for patients attending rheumatology clinics should be considered to improve effectiveness of the commodity rheumatology expertise.

AB1079 FOLLOW UP OF PATIENTS WITH RHEUMATIC DISEASES BY MEANS OF A SMARTPHONE APPLICATION: SATISFACTION INDEX BASED ON A SURVEY AMONG USERS AND CARE PROVIDERS

C.A. Guillen-Astete[1], J.L. Alba-Barton[2]. [1]*Rheumatology Department, Ramon y Cajal University Hospital, Madrid, Spain;* [2]*Informatics, Surveys and Stata, Lima, Peru*

Background: Therapeutic adherence is the main variable in order to assess success or failure of any treatment. It is matter of interest to any clinician to get information enough about treatment response along time to reach a better understanding of any factor that conditions adherence failure or treatment interruptions. However, this kind of information is quite difficult to obtain in real scenarios due to lack of time or memory issues.
Objectives: The aim of present study is to assess the opinion of users of a smartphone application developed to improve the follow up of patients with different rheumatic diseases.
Methods: We conducted a survey to the users of REUMapp, an electronic form based on Google Form® software. REUMapp is an electronic interactive form developed for four different clinical scenarios: REUMapp-Esp (spondyloarthritis), REUMapp-Cristal (gout and othe microcrystalline arthropathies), REUMapp-AR (Rheumatoid arthritis) and REUMapp-MSK (soft tissues). All forms were developed over the basis of paper forms previously used for the same purposes and to be checked on follow up consultation. Forms were designed to gather information about daily treatment adherence (binomial), daily modifications (categorical), adverse effects (categorical) and therapeutic response in terms of visual analogical scale. REUMapp-ESP and REUMapp-AR include also specific joint recounts and indexes. All the forms could be completed in less than 3 minutes by the patient or his/her care provider. Every form contents became part of a database easily accessible during the follow up visit in a summarized way. Between 2014–2016, 419 apps were installed in patients or care provider's smartphones from two non public rheumatology clinics of Madrid with fully consentient of them. A survey was send to every user at the third to twelfth month after installation who have had one follow up consultation at least and who previously used the paper forms. Survey was developed using a multiple answer scheme using visual 7-level horizontal Likert scales. Topics of the survey were as follows: simplicity, time consumption and usefulness. Surveyed patients also were asked for the usefulness of the paper-based form.
Results: 205 Patients or care providers answered the survey. From them, 36 patients had diagnosed by rheumatoid arthritis, 23 by spondyloarthritis, 68 by gout or other microcrystalline arthritis and the rest by any other soft tissue rheumatisms. Following table shows the results of the survey. In the non parametric analysis of usefulness, the app was considered more useful than the paper format with a wilcoxon coefficient of contrast for paired data of -6.6589 ($p<0.0001$).
Conclusions: The smartphone applications described in this study have a good acceptance among patients of care providers in terms of usefulness, time consumption and simplicity and they are considered more useful than the printed models.

	Mean	Median	Mode	Variance	Standard deviation	Interquartile range	Curtosis (STD)

AB1080 RESULTS IN THE FOLLOW-UP OF THE NURSING CONSULTATION FOR THE MONITORING OF RHEUMATOLOGIC PATIENTS TREATED WITH INTRAVENOUS THERAPIES

C. Nájera Herranz[1], I. Cánovas Olmos[1], J. Ivorra Cortes[1], E. Grau Garcia[1], C. Alcañiz Escandell[1], K. Arévalo Ruales[1], I. Chalmeta Verdejo[1], C.M. Feced Olmos[1], J.J. Fragio Gil[1], R. González Mazarío[1], L. Gonzalez Puig[1], E. Labrador Sánchez[1], I. Martínez Cordellat[1], R. Negueroles Albuixech[1], J.E. Oller Rodriguez[1], F.M. Ortiz-Sanjuan[1], E. Vicens Bernabeu[1], D. Hervás Marín[2], J.A. Román Ivorra[1]. *[1]Rheumatology Department, HUP la Fe; [2]Biostatistics Unit, IIS la Fe, Valencia, Spain*

Background: In the management of rheumatologic patients treated with intravenous therapies, its regular monitoring is recommended in order to ensure its safety. The Nursing Consultation for monitoring rheumatologic patients treated with Intravenous Therapies (NCIT) represents a major support to patient caring for it provides patient monitoring before treatment administration and prior to rheumatologist consultation.
Objectives: To analyze number and types of incidents detected in the NCIT.
Methods: A cross-sectional longitudinal, observational study of data from patients followed-up in the NCIT (which was initiated in 2012) was performed. We have collected data of gender, diagnosis, drug administered, incidents detected previously to the drug administration, and if the incident was detected by telephone (one day before drug administration) or by personal interview. Biostatistical analysis with R (3.3.2.) was performed.
Results: We analyzed 7809 drug infusions corresponding to 545 patients (73% women). 48.25% of patients were diagnosed with osteoporosis (OP), 30.1% rheumatoid arthritis (RA), 5.7% ankylosing spondylitis (AS), 4.2% systemic lupus erythematous (SLE), 2.9% psoriatic arthritis (PsoA) and 8.3% had other diagnosis. The intravenous therapies were antiosteoporotic drug (7.8%) and biological and immunosuppressive treatment, being the most common drugs tocilizumab (38.89%), infliximab (31.9%) and abatacept (18.05%). In the 7809 treatment infusions, 477 incidents (4.1%) were registered, 33 of them related to the antiosteoporotic therapies and the other 444 incidents (93%) occurred in the biological therapies. The 63.7% of the incidents were detected by telephone one day before drug infusion. Statistical analysis showed that SLE patients exhibit higher tendency to incidents (4.8% of incidents in the 392 treatments for SLE patients; P=0.026) than other autoimmune diseases. On the other hand, RA and AS patients have incidents detected mainly by telephone ((P=0.047 y P=0.029 respectively). We also observed a high number of incidents in the intravenous administration of TCZ (P=0.009).
Conclusions: The NCIT has performed the follow-up of more than 5oo patients with only 6% of incidents, contributing to an improvement in the patients' health and in its caring. Moreover, the fact of identifying the incidents helps to reduce the number of personal consultations, avoids drug preparation in those cases where this infusion is suspended, and in summary it improves management of hospital resources.

AB1081 INTEGRATING CASE FINDING AND INITIAL MANAGEMENT FOR OSTEOARTHRITIS, ANXIETY AND DEPRESSION INTO ROUTINE PRIMARY CARE NURSE-LED LONG-TERM CONDITION REVIEWS: RESULTS FROM THE ENHANCE PILOT TRIAL

C. Jinks[1], E. Nicholls[1,2], J. Liddle[1], E.L. Healey[1], A.L. Evans[1], C.A. Chew-Graham[1], K.S. Dziedzic[1], V.A. Tan[1], A.G. Finney[1], M. Porcheret[1], S. Lawton[2], V. Cooper[1], M. Lewis[1,2], C.D. Mallen[1] on behalf of ENHANCE team. *[1]Research Institute for Primary Care & Health Sciences; [2]Keele Clinical Trials Unit, Keele University, Keele, United Kingdom*

Background: Co-morbid osteoarthritis (OA), anxiety and depression are undermanaged in primary care yet have significant impact on pain, disability and outcomes of other long-term conditions (LTCs).
Objectives: To test the feasibility and acceptability of integrating case-finding and initial management for OA, anxiety and depression within extended primary care practice nurse (PN)-led LTC review consultations.
Methods: A stepped wedge pilot trial with process evaluation. PNs gave a study pack to patients age ≥45 years attending routine LTC reviews (asthma, COPD, hypertension, ischaemic heart disease, diabetes). The intervention included case finding questions (Generalized Anxiety Disorder (GAD2), Whooley 2-item depression, diagnosing OA clinically (hands, hips, knees or feet)) followed by further assessments (anxiety (GAD7), depression (PHQ9), joint examination). PNs completed an electronic patient record and initiated management. Predetermined success criteria were to recruit 4 practices; deliver training to 2 PNs per practice, recruit 50% of those invited, ensure 75% follow up (6 week, 6 month), and the satisfaction (GPAQ) of intervention patients to be at least as acceptable as that of control patients. 24 audio recorded consultations provided insight into fidelity of intervention delivery.
Results: Four practices were recruited. PNs were sequentially trained in practice prior to switching to intervention. Of the 474 people invited, 319 responded (207 control, 112 intervention) (67%). 83% and 79% of participants returned 6 week and 6 month questionnaires respectively. Demographic characteristics, general health, pain intensity, anxiety and depression scores were similar across arms. Overall, self-reported health (EQ5D5L) was high (median 0.84; IQR 0.72, 0.94). 14% of participants reported moderate to severe depression (PHQ9). Median GPAQ scores were similar (control 1.00 (IQR: 1.00, 1.29), intervention 1.00 (IQR: 1.00, 1.14)). 96% of those in the intervention arm reported being asked about joint pain, 93% reported being asked about mood. Audio recordings revealed that case finding questions were used as intended in most consultations (joint pain 20/24 consultations, anxiety 15/24, depression 6/24). One referral to physiotherapy and none to primary care mental health services were recorded by the PNs.
Conclusions: Recruitment and follow up were good. However, to target those who may benefit from the intervention, changes to the target population and eligibility criteria are required. There was reasonable delivery of the case finding questions, but limited referral and signposting, highlighting areas to optimise ahead of a main trial.

AB1082 IMPACT OF ANKYLOSING SPONDYLITIS VERSUS NON-RADIOGRAPHIC SPONDYLOARTHRITIS ON EARLY RETIREMENT

C. Cobilinschi, R. Ionescu, D. Opris-Belinski. *Sfanta Maria Clinical Hospital, Bucharest, Romania*

Background: Axial spondyloarthritis include non-radiographic SpA (nr-SpA) and ankylosing spondylitis (AS), suggesting the extent of sacroiliac involvement on imaging techniques (1). The influence of the two conditions on patients' physical function and their impact on work capacity should be regularly assessed so that we can better contribute to patients' social integration.
Objectives: The present study aims to assess the differences between AS and nr-SpA patients under anti-TNF therapy regarding disease related retirement (DR) and its contributing factors.
Methods: Over a period of eleven months 136 patients diagnosed with AS or nr-SpA on current biological therapy were included. Demographic data and working status were assessed. Statistical analysis was performed with SPSS 20.0.
Results: In the study cohort 69% of patients were males. The predominant age group was situated between 30 to 40 years old (29.8%), while 20.2% were over 50. Out of the study group, 66% confirm they are active in their work field with a minimum of seven hours per day, whereas 4.3% reached their retirement age. 29.8% of patients were granted a disability retirement and the majority (42.9%) belonged to the 40–50 age group. Surprisingly, 6.8% of early retired patients were under 30. Out of the DR category, 92.9% were diagnosed with AS, while the rest of 7.1% had nr-SpA. The interval from diagnosis to the initiation of biological therapy was 72.5±85.1 months for AS patients and 64.1±71.2 for nr-SpA. 23.2% of patients applied for early retirement before biological therapy and only 3.1% resumed work after anti-TNF introduction. Patient gender did not influence the working capacity. At the time of study inclusion, 12% of patients with AS and 4% of patients with nr-SpA still exhibited signs of highly active disease, according to ASDAS-CRP assessment.
Conclusions: Almost a third of patients in the study group were offered early retirement due to axial SpA. The vast majority of disease related retirement patients were known with AS, thus emphasizing the extent of disability brought on by this entity. However, a significant percentage of patients suffered from nr-SpA, raising doubts as to whether clinicians can promptly diagnose this entity and offer early, appropriate treatment so that inability no longer occurs.

AB1083 WORK IMPAIRMENT IN PATIENTS EXPERIENCING MUSCULOSKELETAL PAIN

N.M. Higgins[1], A. Cochrane[1], C.J. Rothwell[1], O. FitzGerald[2], P. Gallagher[3], J. Ashton[4], R. Breen[5], A. Brennan[6], O. Corcoran[7], D. Desmond[1]. *[1]Department of Psychology, Maynooth University, Maynooth; [2]School of Medicine and Medical Sciences, University College Dublin; [3]School of Nursing and Human Sciences, Dublin City University; [4]Physiotherapy Services, Beaumont Hospital; [5]Royal College of Physicians in Ireland; [6]Physiotherapy Services, AMNCH, Dublin; [7]Rheumatology Services, Waterford University Hospital, Waterford, Ireland*

Background: Many individuals with musculoskeletal disorders (MSD) continue to work. Little is known about those who remain occupationally active relative to those who are on sick leave, despite the clear potential for reduced productivity or work ability, and associated downstream effects.
Objectives: To assess self-reported work impairment and its associations with psychosocial risk factors amongst workers seeking care for musculoskeletal pain.
Methods: Recruitment took place in five Irish hospitals. Self-report questionnaires were used to assess risk of progressing to long-term sick leave and work disability (Örebro Musculoskeletal Pain Screening Questionnaire; ÖMPSQ), work ability, work impairment (WPAI) and work performance (WRFQ).
Results: 155 patients (53.5% female; mean age =46.50 years (range 20 to 71)) completed the questionnaire. 25.2% (n=39) were at high risk of progressing to long-term sick leave and work disability according to the ÖMPSQ. 62.6% (n=97) were classified as functioning poorly according to the WRFQ; 52.3% reported having poor work ability (n=81). Higher work role functioning was associated with higher pain self-efficacy (OR =1.514); better work ability was associated with older age (OR =1.063) and poorer function (OR =0.929); absenteeism was associated with lower pain self-efficacy (OR =0.650) and higher return to work expectancy (OR =1.179). Presenteeism was associated with higher pain intensity (β =0.259) and lower pain self-efficacy (β = - 0.385).
Conclusions: MSDs affect many individuals ability to work effectively. While all participants have managed to stay at work despite decreased levels of work ability and functioning, approximately a quarter are at high risk of progressing to long-term sickness absence. Interventions that attempt to improve mutable factors, such as pain self-efficacy, may help reduce the likelihood of work disability.

AB1084 CONTRIBUTION OF CLINICAL TRIALS TO THE EFFICIENCY OF ARTHRITIS RHEUMATOID MANAGEMENT

C. Alcañiz Escandell, E. Vicens Bernabeu, F.M. Ortiz-Sanjuan, J.E. Oller Rodriguez, C. Nájera Herranz, I. Cánovas Olmos, E. Grau Garcia, C.M. Feced Olmos, E. Labrador Sánchez, K. Arévalo Ruales, R. Negueroles Albuixech, J. Ivorra Cortes, J.J. Fragio Gil, I. Martínez Cordellat, R. González Mazarío, I. Chalmeta Verdejo, L. Gonzalez Puig, J.A. Román Ivorra. *Rheumatology Department, HUP la Fe, Valencia, Spain*

Background: Treatment and management of Rheumatoid Arthritis (RA) results in a high cost to the Health system such as the Spanish Health System. During the realization of clinical trials (CT) the sponsor is the one that pays for the direct healthcare costs of the patients, which leads to savings to the National Health System (NHS).
Objectives: To estimate the economic impact of conducting clinical trials (CT) for the NHS in terms of avoided costs.
Methods: A retrospective observational study was conducted using information from the clinical trials performed at the Clinical Research Rheumatology Department in the HUP la Fe from 2011 to 2015. Also a Cost-analysis was performed according Health System perspective. We calculated the length of stay in the CT in weeks for each patient included with RA diagnosis. Afterwards, we also calculated the total number of weeks of treatment for the total number of patients. In order to evaluate the economic impact in terms of avoided costs, economic evaluation included direct healthcare costs (rheumatologist visits, nurse care, laboratory tests and pharmacological treatment), and it was compared to the cost of the best alternative treatment in the market.
Results: A total of 35 CT were analyzed in this period, 14 of them focused on RA. Two observational studies and one CT (premature closure by the sponsor) were discarded. Therefore, 11 were considered in this study and a total of 76 patients with RA were analysed which add together 2609 weeks of treatment. This is approximately equivalent to treating 50 RA patients with biological therapy during one year. Evaluating the health savings that biological treatment would have cost during the 2609 weeks, we obtain a total amount of 699.176,88 €. This represents an annual saving of 139.835€ over the 5 years analyzed.
Conclusions: Our Clinical Research Unit managed to save a total amount of 13.935,30 € per patient in CT per year. Clinical Research Units should be considered as an efficient tool to the NHS.

AB1085 MEASURING PATIENT SATISFACTION OF BIOLOGICAL TREATMENTS IN A REGIONAL HOSPITAL

D. Grados[1], A. Retamero[2], A. Riveros[1], C. Baliu[3], E. Nogues[3], D. Ferrandez[2], F. Bové[4], A.M. Colquechambi[5], M. Cucurell[3]. *[1]Rheumatology; [2]Pharmacy; [3]Dermatology; [4]Nursery; [5]Family medicine, Hospital d'Igualada (consorci sanitari Anoia), Igualada, Spain*

Objectives: To determine/measure the satisfaction degree of patients with rheumatologic (rheumatoid arthritis, spondyloarthropathies and other arthritis) and dermatological (psoriasis, psoriatic arthritis and suppurative hidrosadenitis) disease treated with a biological drug.
Methods: Descriptive prospective study conducted in a Regional Hospital with a reference area of 109,530 inhabitants.
A survey was conducted to all patients, thepatientswhocollectedtheir medication at the Pharmacy Service (self-administration treatment) and the patients who came for consultation (treatment administered by the nursing staff). The satisfaction degree before and after the biological treatmentwas evaluated.From 0 to 10, where 0 was the maximum dissatisfaction and 10 the maximum satisfaction; and improvement of pain, where 0 implied no improvement and 10 maximum improvement.
Clinical records were reviewed and a database was generated for exploitation with SPSS-vs 22. All patients received an information sheet from the study and signed an informed consent form.
Results: A total of 100 patients were analyzed: 45 men and 55 women. The mean age was 53 years (SD 14.9). 42% of patients were actively employed.
Distribution of patients by pathologies: 46 (46%) rheumatoid arthritis, 25 (25%) psoriasis, 16 (16%) psoriatic arthritis, 8 (8%) spondyloarthropathies, 2 (2%) suppurative hydrosadenitis and 1 (1%) juvenile idiopathic arthritis.
Distribution of biological drugs: 49 (49%) adalimumab, 20 (20%) ustekinumab, 18 (18%) etanercept, 6 (6%) golimumab, 3 (3%) tocilizumab, 2 (2%) secukinumab,1 (1%) certolizumab. The treatment was self-administered in 61 patients.
Only 30 (30%) patients had undergone previous biological treatment. At present, 43 patients had some additional treatment, 38 with methotrexate and 5 with leflunomide.

Satisfaction degree before biological treatment, n (DE)	2.8 (2.6)
Satisfaction degree after biological treatment, n (SD)	7.9 (1.6)
Pain improvement, n (SD)	7.8 (2.1)
Comfort with the route of administration, n	94
Comfort with frequency of administration, n	97
Degree of pain during administration, n (SD)	3.2 (3.2)
Patients who have missed doses, n	15
Patients who have controlled the disease with the biological treatment, n	93
Patients who have improved the quality of life with the biological treatment, n	93
The patient considers to have sufficient information of the drug, n	80
The patient considers to have sufficient information of the disease, n	87
They belong to a patient association, n	4

Conclusions: The satisfaction degree of patients with their biological treatment is very high regardless of the route of administration. Most of them are in monotherapy or with low doses of FAME. 61% of patients self-administer the drug at home. 93% of patients consider that there has been a change in their quality of life and that they can lead a normal life.

AB1086 THE PREVALENCE AND THE REACTIVATION RATES OF HEPATITIS IN PATIENTS WHO ARE TAKING AN IMMUNESUPRESSIVE AGENT FOR TREATMENT OF A RHEUMATOLOGICAL DISEASE

B.N. Coskun[1], B. Yagız[1], S. Ermurat[1], E.S. Danaci[2], A.N. Tufan[1], E. Dalkilic[1]. *[1]Rheumatology; [2]Internal Medicine, Uludag University, Bursa, Turkey*

Background: Today, the immunosuppressive treatment agents became important for therapy of rheumatoid diseases. Theoretically, the use of these agents may result in reactivations be in patients that infected with Hepatitis B (HBV) and Hepatitis C (HCV) virus.
Objectives: We aimed to study the reactions during treatment and prevalence of HBV and HCV infections in rheumatology patients who are using immunosuppressive treatment.
Methods: The records of a total of 1146 patients who were taking an immunosuppressive treatment for a rheumatoid disease were reviewed retrospectively. The hepatitis serology, type of immunosuppressive treatment, the duration of treatment, liver function tests, complete blood count; HBV – DNA and HCV – DNA and antiviral agents and time of use (if patient is infected) were recorded.
Results: There were 682 (59.5%) women and 464 (40.5%) men, the mean age was 45.04±13.13. Ankylosing spondylitis (AS) was diagnosed in 453, rheumatoid arthritis (RA) in 365, psoriatic arthritis in 151, systemic lupus erythematosus in 43, vasculitis in 39, Behçet Disease in 26, systematic sclerosis in 18, myositis in 9, juvenile rheumatoid arthritis in 7, Sjögren Syndrome in 7, Still Disease in 3, familial mediterian fever in 6, retroperitoneal fibrosis in 1 and mixed connective tissue disease in 1 patient. The rate of HbsAg positivity was 1.8% in AS and 2.2% in RA; the rate of HCV positivity was 0.7% and 1.9% respectively. While

HBsAg, AntiHBs and anti-HBcIgG was tested for 898 patients, in 28 patients (2.4%) HBsAg and AntiHBs were negative and anti-HBcIgG was positive. The liver function tests were increased in two occult hepatitis patients, and lamivudine was administered for one and tenofovir for another patient. HCV-RNA was found negative in 12 of 18 patients that positive for HCV. Only one patient had ribavirin + interferon treatment and no reactivation was detected during follow up. The mean length of immunsuppressive treatment was 22.26±18.21 months for HBV positive patients, 19.43±21.40 months for HCV positive patients and 20.94±19.7 months for occult hepatitis. Furthermore, we 10.1% of the patients were vaccinated, 13.4% had natural immunity and 50.7% of patients has not encounter with virus.
Conclusions: HBV prevelance was 3.99% and HCV prevelance was 0.95% in general population, although there is difference according to geographical region in our country. HBV prevelance was the highest 9.9% in southeast region and the lowest 0.7 – 2.5% in west region. Low HBV prevelance could be associated with included patients that was young and stay in west region. Because hepatit virus can be reactivate under immunsupressive treatment, patients should be scanned and be careful for occult hepatitis in these scans.

AB1087 POVERTY, POOR NEIGHBORHOODS, AND SLE OUTCOMES: THE PATIENT'S PERSPECTIVE

E. Yelin, J. Yazdany, L. Trupin. *University of California, San Francisco, San Francisco, United States*

Background: Studies have shown that persons in poverty experience worse outcomes of SLE and that the effect of poverty on outcomes is exacerbated for those living in neighborhoods with a high proportion of households in poverty. We report the results of a project to explore the viewpoint of SLE patients on how income and neighborhood affect disease outcomes.
Objectives: To explore the perspective of SLE patients with SLE on the effect of income, neighborhood, and stress on outcomes: 1) How does presence or absence of money affect care for SLE and in dealing with disease? 2) What role, positive or negative, does neighborhood play in SLE care and outcomes? 3) What are specific stresses that make dealing with SLE difficult?
Methods: We recruited SLE patients for qualitative interviews from a national longitudinal study of SLE conducted between 2003 and 2015. Subjects were selected to highlight the effects of income (those in the highest and lowest income quintiles), neighborhoods (living in neighborhoods with a high proportion of households in poverty vs. not), geographic diversity (four regions of the U.S.; urban, suburban, and rural residents), and range of SLE outcomes. An experienced interviewer conducted hour-long semi-structured interviews which were recorded, transcribed, and analyzed using grounded theory methods.
Results: 28 qualitative interviews were completed; 11 from the highest income group and 17 from the lowest (11 from poor neighborhoods).3 were men, 20 members of racial/ethnic minorities, and mean age was 49, range 22–70. Among the poor, none cited lack of money as limiting their access to care, but all stated that it necessitated choosing which pressing needs to focus on, with food and housing a higher priority than dealing with their SLE. Among the more affluent, financial resources were used to provide help in daily chores or to withdraw from work to reduce stress and allow for more time to manage their disease. Among the poor, none cited a positive benefit of neighborhood in finding health care resources or in mitigating how they dealt with disease but all cited a negative effect of being exposed to high rates of crime, the principal stress mentioned (F*rom a central city resident:* "A good neighborhood for someone with lupus is a place where you're not robbed twice in a year inside your apartment and not raped on way home from the bus". *From a rural resident:* "I don't worry about safety anymore. I sleep with a 357 Magnum"). Among the more affluent, local neighborhoods played no role in accessing care or in dealing with disease, with several stating they used professional networks not based in their neighborhood to find skilled providers or support (*From a resident of suburban Phoenix:* My physician's classmate in medical school was a rheumatologist at Mayo who knew someone here in Arizona").
Conclusions: Poverty forced choices in priorities, with SLE often having a lower priority than housing or food security. Exposure to crime was the stress repeatedly mentioned by the poor as exacerbating the disease. The affluent in this study indicated that they were able to reduce stress by paying for personal assistance, withdrawing from work, and using networks that extend beyond their neighborhoods to help gain access to resources. Mitigating poverty and reducing exposure to crime by helping the poor move to safer neighborhoods through housing vouchers may improve outcomes in SLE for the poor.

AB1088 THE PATIENTS' VIEWPOINT ON A SPECIALISED BIOLOGIC SERVICE

E. Cefai, D. Balzan, C. Mercieca, A.A. Borg. *Rheumatology, Mater Dei Hospital, Msida, Malta*

Background: Biologic disease modifying anti-rheumatic drugs (DMARDs) have been a major breakthrough in the treatment of inflammatory arthritis. In clinical practice, providing timely monitoring to ensure continued efficacy and safety remains a challenge. The availability of a dedicated clinic for patients on biologics may help meet these standards.
Objectives: The aim of this study was to get the patients' perspective of our dedicated biologic clinic and identify any unmet needs.
Methods: Patients attending the biologic clinic between April and September 2016 and who were on a biologic for more than 2 years were interviewed by a trainee following their clinic visit. The patients were asked about their level of satisfaction on various aspects including waiting times, education, involvement in decision-making and duration of consultations.
Results: 44 patients (23 females, 21 males) participated in the survey, of whom 21 suffered from rheumatoid arthritis, 17 from ankylosing spondylitis and 6 from psoriatic arthritis. The mean age of participants was 55.1 (SD 12.62) years. The mean DAS28 was 2.26 (SD 1.03) and the mean BASDAI was 4.21 (SD 2.4). Disease duration was less than 5 years in 20%, 6 to 10 years in 30% and more than 10 years in 50%. Overall satisfaction with arthritis education before initiation of treatment was 91%, which then dropped to 76% after treatment initiation. Satisfaction with education regarding biologic therapy was more consistent at 84% and 81% before and after starting treatment, respectively. 84% of patients reported to be satisfied with their involvement in the decision to start and continue biologic therapy. 77% of patients were satisfied with a consultation lasting 15 to 20 minutes and 77% were also satisfied with 6-monthly visits. The most valued source of education was communication with the caring rheumatologist (n=32), followed by specialist nurse education (n=15), Internet resources (n=14) and use of leaflets (n=13). 95% of patients reported to have rarely or never missed an appointment. The rheumatology advice line was used by 54% of patients, whilst the rest reported that they did not need it since starting the biologic. The greater majority of advice line users were very satisfied with the service provided. Amongst the unmet needs mentioned, were better arthritis education and the introduction of telephone consultations.
Conclusions: Even though most patients were clinically well-controlled, continued education delivered by the caring rheumatologist and specialist nurse is still greatly valued. Patients attending this clinic highly valued the staff dedication and had good communication with their caring clinician. They were highly satisfied with the length and frequency of consultations. Nonetheless, a significant number suggested the need to introduce telephone consultations, which could be considered for those stable patients after receiving proper education.

AB1089 USE OF NATURAL LANGUAGE PROCESSING TO ENHANCE RETRIEVAL OF RHEUMATOID ARTHRITIS DISEASE ACTIVITY OUTCOMES MEASURES IN US VETERANS

G.W. Cannon[1], S. Mehrotra[2], B.C. Sauer[2]. *[1]Rheumatology; [2]Salt Lake City Va Medical Center, Salt Lake City, United States*

Background: Rheumatoid arthritis (RA) disease activity measures in the Veterans Affairs RA (VARA) registry are extracted automatically through natural language processing (NLP). While this system is very effective at extracting data when templated notes are properly used, it lacked an error detection and feedback mechanism. Accuracy of the registry is essential for credible epidemiological research and patient care. We report a new automated approach with an active error monitoring and reporting system to alert providers of missing or potentially erroneous elements that can be easily corrected using standardized addendums available in the electronic medical record. The automated NLP system was revised to identify, extract, and integrate these updates to support the calculation of DAS28 and other composite outcome measures for the VARA database.
Objectives: 1. To describe the systems to identify needed corrections of VARA data.
2. To outline the procedures that allow providers to easily use addendums to enter corrections into the medical record to be automatically captured and loaded into the VARA database.
Methods: Procedures were developed and tested at a single pilot VARA site using data available in the Corporate Data Warehouse (CDW) from 01/01/2016 to 12/31/2016. A Java program was designed to retrieve Rheumatology notes, and corresponding addendums, based on "local" and "national" note titles. Notes were then processed to extract defined elements of RA disease activity listed in the table below. After each scheduled NLP run the system generates a log file that provides a summary, and patient-level report of completed and missing data elements. Providers receive the report and are asked to review the clinical notes of patient visits with missing data elements and follow simple procedures that leverage addendums to add or correct data elements when template violations occur. Addendums are also used to terminate the flag and request for review when the items are not available in the notes. Updating the VARA database from addendums occurs during the next NLP run.

Results: During the pilot testing phase the automated system processed 516 notes and identified 489/516 (94.8%) as successful loads, and 27/516 (5.2%) were flagged as problematic since one or more data elements were missing. Misapplication of the template occurred in 21/27 (77.8%) of notes flagged by the monitoring system and corrected with addendums. An additional NLP run produced 510/516 (98.8%) completed assessments with calculated DAS28 scores. Specific elements recovered using this process are presented in table below.

Total notes processed (n = 516)	Number (%)	
Elements investigated	Missing data elements	Elements Corrected
Tender Joint Count	1/516 (99.8%)	1/1 (100%)
Swollen Joint Count	2/516 (99.6%)	2/2 (100%)
Patient Global Assessment	11/516 (97.8%)	8/11 (72.7%)
Physician Global Assessment	9/516 (98.2%)	7/9 (77.8%)
Modified Health Assessment Questionnaire	15/516 (97.1%)	10/15 (66.7%)
Pain Score	11/516 (97.8%)	9/11 (81.8%)
Total notes with ≥1 missing elements	27/516 (94.8%)	21/27 (77.8%)

Conclusions: The addition of this error monitoring system provides an efficient data correction system and is expected to motivate and reinforce the use of RA templates. The implications of which may be profound as we transition from traditional epidemiological research to a more active learning healthcare enterprise. This pilot study established "proof of concept" and the next challenge is to adapt the technology to other VARA and non-VARA sites. This technology and framework could enable collaborative clinical research networks that are committed to large-scale pragmatic and observational effectiveness studies.

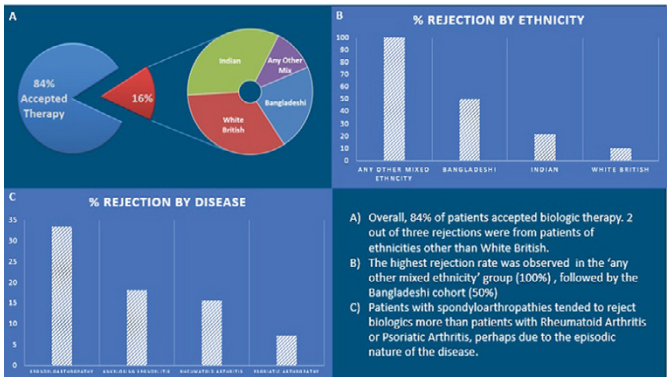
AB1090 IS THERE AN ETHNIC VARIATION IN ACCEPTANCE OF BIOLOGIC THERAPY? A UNIVERSITY HOSPITAL EXPERIENCE

H. Selvaskandan, H. Al-Ani, A. Moorthy. *Department of Rheumatology, University Hospitals of Leicester, Leicester, United Kingdom*



Background: Ethnic variation in drug adherence & preference is well documented (1). While usually a reflection of patient autonomy, the issue takes significance if it impedes the provision of effective evidence based care. Indeed, race affects rheumatological disease outcomes (2), likely for both biological & psychosocial reasons. Studies from United States of America found ethnic minorities were less likely to be on a biologic for a rheumatological disease compared to Caucasians, even after adjustment for education & insurance (3). Studies in the United Kingdom found similar results (4), although few investigated the disparity in the acceptance of biologics between ethnicities. Leicester, a midland UK city has an ethnically diverse population, where identifying and addressing such disparities is crucial in delivering effective & equal care.

Objectives: To determine any disparity in acceptance of biologic therapy, when offered in person, in a healthcare system free at the point of access, between White British and other ethnicities.

Methods: Data was collected from nurse led Biologics therapy clinics, from October 2016 to December 2016. All patients referred were deemed suitable for a biologic as per NICE guidlelines by a Rheumatologist, and were attending the clinic for counselling, assessment & consenting. Proformas were piloted, and improved proformas with information including demographic, disease & treatment details, as well the outcome of the consultation (biologic accepted or rejected) was used to collect data. The collated data were then analysed using EXCEL spread sheet.

Results: Data was collected from 55 patients. Interestingly, sex distribution was nearly equal (54% female). 57% of the total sample was White British (WB). The remaining 43% included; Indian, Bangladeshi, Pakistani, White Other, Asian other, African Caribbean & Any other mixed race. The most common disease necessitating referral for a biologic was rheumatoid arthritis (53%).

16% of patients rejected a biologic drug, of which 66% were ethnic minorities. The rejection rate among ethnic minorities was thus 24% compared to 10% in the WB cohort. The highest rejection rate was within the Any Other Mixed Ethnicity cohort (100%), followed by the Bangladeshi cohort (50%). Of note, all patients who rejected biologic therapy from an ethnic minority background did not speak English as their first language. Rejection rates were highest in the Spondyloarthropathies (21%).

Conclusions: Our results demonstrate a disparity between the White British population and other ethnicities in the acceptance of biologics, despite one to one counselling. This can have detrimental impacts on treat to target concept and disease progression, and thus will be further investigated & addressed.

AB1091 HIGH ACCEPTANCE RATE IN RA, AS AND PSA PATIENTS WHEN BEING STARTED ON BIOSIMILAR TNF OR BEING SWITCHED FROM THE ORIGINAL TNF MAB (REMICADE, ENBREL) - A SINGLE CENTER EXPERIENCE

H. Kellner. *Schwerpunktpraxis für Rheumatologie und Gastroenterologie, München, Germany*

Background: Biiosimilar TNF Mab (BioTNF) have become available in most of the European countries in the last few years. They are labeled to be used in the most common rheumatic diseases, like RA, AS and PsA. Controlled studies have shown comparable efficacy and safety of BioTNF and original TNF (Remicade, Enbrel). BioTNF are allowed to be used in TNF naive patients as well as in TNF pretreated patients (switchers). Prescriptions in different countries may vary due to local most often cost driven restrictions.

So far, little is known about the awareness, acceptance and possible obstacles which may influence patients willingness to accept therapy with BioTNF instead using the original compounds

Objectives: The study was conducted and designed to get a deeper insight in what may influence patients decision making and willingness to accept treatment with BioTNF firsthand or accept switching.

Methods: Between February 2015 and December 2016 41 patients (BioINF n=29, BioETA n=12) were introduced to BioTNF therapy. 9 Patients (Bio-INF n=3, Bio-ETA n=6) received TNF therapy the first time, in 32 patients (Remicade n=23, ETA n=8) werde switched from the originator TNF compound to BioTNF. All patients received comprrehensive information on BioTNF in verbal and written form.

A standardised questionaire was used to ask patients on their awareness, acceptance and about possible obstacles for the usage of BioiTNF Mab.

Results: 6 out of 9 TNF naive patients agreed after their first information on BioTNF to start therapy with BioINF (n=3) or BioETA (n=3). Another 2 patients accepted BioETA therapy on their second visite. Only one patients asked to be started on the originator TNF Remicade. In patients being ask to switch from Remicade to BioINF 19 patients accepted promptly to be switch and in patients with Enbrel therapy 6 out of 9. Finally only 1 patient on Remicade TNF therapy denied even after a third visit to be switched. Mayor concern to deny the use of BioTNF were possible lack of efficacy (30%), safety (32%) and missing longterm experience (35%). The main motivation to switch was patients believe to save money and that they were ask to switch to BioTNF Mab on short notice from their health care insurance company.

Conclusions: There is a high acceptance rate in patients with chronic inflammatory rheumatic disease to be started on or switched to BioTNF (>90%). Their are little concerns in patients accepting BioTNF with regard to safety or efficacy of BioTNF. Patients are aware of BioTNF as a less costly way to treat their rheumatic condition. Physicians should be aware of this willingness and offer BioTNF therapy were it is appropriate. Using BioTNF is a cost saving way to use biologics in rheumatic therapy with equal efficacy and safety compared to the originiator compounds.

AB1092 SATISFACTION AND BELIEF REGARDING TREATMENT WITH INTERSTITIAL LUNG DISEASE AND RHEUMATIC DISEASES IN MULTIDISCIPLINARY OUTPATIENT CLINIC

J. Jung[1], S. Jung[1], S. Kim[2], J.R. Choi[3], H.-S. Kim[1]. *[1]Internal medicine, the Soonchunhyang University Seoul Hospital, Seoul; [2]Internal medicine, Gangneung Asan Medical Center, Gangneung; [3]Internal medicine, Pohang Saint Mary's Hospital, Pohang, Korea, Republic Of*

Background: Among rheumatic disease-related lung disease, interstitial lung disease (ILD) is the most prevalent and contributing to the mortality and morbidity. Increasing number of recent reports dealing with ILD of rheumatoid arthritis (RA), Sjögren's syndrome (pSS) and systemic sclerosis (SSc), multidisciplinary discussions (MDDs) have been growing interest for diagnostic accuracy with dedicated service. There was little evidence indicating that multidisciplinary outpatient clinic resulted in improvements in clinical outcomes including satisfaction and belief.
Objectives: We have designed validated a scale of evaluating coping strategies about satisfaction and belief in patient of ILD and rheumatic disease with multidisciplinary approach.
Methods: From December 2015 to September 2016, we evaluated 20 patients of rheumatoid disease with ILD and 20 patients of idiopathic pulmonary fibrosis. Patient perceptions of illness, treatment beliefs, and moods were measured via the multiple choice questionnaires presenting brief Illness perception questionnaire, beliefs about medicines questionnaire, and patient health questionnaire 2 for comparing the effectiveness of MDDs and routine ILD management.
Results: In univariate analysis, beliefs in necessity and concerns of medication differed significantly high in multidisciplinary outpatient clinic for people with ILD (intentional or unintentional). When controlling for other factors that may impact medication nonadherence, more belief in necessity of medication and greater positive emotional response to disease were presented in multidisciplinary outpatient clinic for people with ILD (OR 1.51, CI 1.01–1.82).
Conclusions: The MDD including rheumatologist and pulmonologist allows a satisfactory management comparing routine ILD management. It showed better coping improvements about the emotional distress, pain, and beliefs about treatment. Further research to investigate long-term clinical outcomes of multidisciplinary outpatient clinic for people with ILD is required, overlying the enhancement of mutual communication.

AB1093 BIOSIMILAR INFLIXIMAB IN RHEUMATOLOGY PRACTICE - THE CYPRUS EXPERIENCE

J. Joseph, M. Solonos, M. Michaelides, V. Hadjiroussos, V. Skoutellas, N. Zannettou, C. Christodoulou, E. Mina, A. Therapontos, D. Nikiforou, S. Psarellis, S. Symeonidou, A. Tsirogianni, M. Michaelidou. *Cyprus Rheumatology Association, Nicosia, Cyprus*

Background: Infliximab ('Remicade') has been authorized in the EU since 1999. It has a license for use in major rheumatic diseases and inflammatory bowel disease. The biosimilar 'Inflectra' received its license in Europe in September 2013. It was first launched in Central and Eastern Europe, and some smaller Western European markets due to earlier patent expiry. Inflectra was introduced to Cyprus in 2014 and soon after that, every patient with rheumatoid arthritis, ankylosing spondylitis and psoriatic arthritis would receive this agent when a biologic agent was required. At first there was significant concern amongst the medical community regarding efficacy and safety of biosimilars. Careful observation and pharmacovigilance are therefore required to analyse the effectiveness and safety of biosimilar agents since the significant price difference means that they will be used extensively from now on.
Objectives: The aim of this study was to record statistics of use, effectiveness and safety of the first biosimilar 'Inflectra' following its introduction in Cyprus.
Methods: Cypriot rheumatologists completed an online form for every patient who was prescribed 'Inflectra' from the introduction of the biosimilar in 2014, until late 2016. Collected data included patient characteristics, diagnosis, whether the patient remains on the drug or not, reasons for discontinuation, side effects and physician impression of effectiveness.
Results: 160 patients were entered. Male: Female ratio was roughly equal and 90% were taking a biologic for the first time ('biologic naive'). Indications were Rheumatoid arthritis in 40%, Ankylosing spondylitis in 33%, psoriatic arthritis and other spondyloarthropathies in 20% and a few patients were treated for eye disease and other 'off-label' indications. At the time of recording, 25% of patients were on the drug for less than 3 months, 25% 3–6 months, 25% 6–12 months and 25% over a year. Overall 30% of patients had to discontinue and 70% remain on the drug. Of those who discontinued, 65% did so within 6 months of starting. Of all patients treated with Inflectra, 10% stopped due to side effects, 7% had immediate non-effectiveness and 3% had secondary lack of efficacy. 80% of patients experienced no adverse effect. Amongst the 160 patients, recorded adverse events included 8 infections, 8 skin rashes, 9 headaches and 5 severe allergic reactions. Amongst the infections were 2 respiratory, 2 herpes zoster, 1 sinusitis 1 cellulitis, 1 urinary and 1 gastroenteritis. 94% knew they were taking a biosimilar and 80% had no objection. Patient concerns included safety and effectiveness. The treating doctor was 'quite' or 'very' happy with achievement of the therapeutic target in 66% of cases and 'unhappy' in only 15%.
Conclusions: Despite understandable concerns with the introduction of biosimilars, the experience with our first 160 patients was good; numbers remaining on the drug and adverse effects were similar to previous large studies of infliximab. Rheumatologists feel happy the therapeutic target has been met in a significant majority of cases. Continuous observation and pharmacovigilance are required as with the introduction of any new agent.

AB1094 ASSOCIATION BETWEEN USE OF TRADITIONAL CHINESE MEDICINE AND MEDICATION ADHERENCE AMONG CHINESE-AMERICAN RHEUMATOLOGY PATIENTS

K. Sun[1], H. Tian[2], Y.J. Chang[3], L. Lee[1], J.C. Leng[4], L.A. Mandl[1]. *[1]Hospital for Special Surgery; [2]New York University School of Medicine; [3]Mount Sinai Beth Israel; [4]Memorial Sloan Kettering Cancer Center, New York, United States*

Background: Chinese-Americans (CA) are a fast-growing US immigrant group with high utilization of Traditional Chinese Medicine (TCM) and worse SLE and RA outcomes than Caucasians (1,2). The effect of TCM use on adherence to prescribed western medications for systemic rheumatic diseases is unknown.
Objectives: To evaluate whether TCM use is associated with adherence to western medicines prescribed for systemic rheumatic diseases among CA patients.
Methods: Patients with systemic rheumatic diseases were recruited from 2 rheumatology clinics that serve a predominantly CA immigrant population. Inclusion criteria were speaking Mandarin or English and having medication(s) prescribed by the rheumatologist. TCM use, adherence, Patient-Reported Outcomes Measurement Information System (PROMIS) domains, and other variables were assessed using validated instruments available in English and Chinese. Adherence was classified as high or medium/low based on the 8-item Morisky Medication Adherence Scale (3). Medication complexity was assessed using the Medication Regimen Complexity Index (MRCI) (4); higher score indicates more complexity.
Results: 177 enrolled, mean age 54 (range 20–97), 62% female, 73% ≤high school education, 75% Medicaid (subsidized insurance), and only 18% spoke English. Diagnoses were RA (43%), SLE (17%), SpA (16%), Sjogren's (8%), gout/CPPD (6%), and other (10%). 49% reported TCM use in the past year, most commonly *tuina* massage (48%), acupuncture (47%), and herbs (39%). 27% reported high adherence. Table 1 shows significant univariate associations with high adherence. In multivariate analysis adjusting for all variables in Table 1, only TCM use (OR 2.6, p=0.027) and higher MRCI (OR 1.1, p=0.019) were associated with high adherence.

Table 1

	High adherence, n=48	Med/Low adherence, n=129	p-value
Age, years (SD)	63 (11)	52 (17)	<0.001
Employed, %	29	48	0.044
≥20 years in US, %	58	39	0.02
Age at immigration, years (SD)	44 (14)	35 (12)	<0.001
RA, %	56	38	0.029
MRCI, mean (SD)	15 (7)	11 (6)	0.001
TCM use, %	63	44	0.03
PROMIS Sleep disturbance, T-score (SD)*	47 (10)	52 (9)	0.005
PROMIS Anxiety, T-score (SD)*	46 (11)	49 (10)	0.04
PROMIS Fatigue, T-score (SD)*	49 (11)	52 (10)	0.03

*Lower score is better.

Conclusions: Among poorly integrated and low socioeconomic status CA rheumatology patients, TCM use was statistically significantly associated with high adherence to western medication, as was higher MRCI. TCM use does not appear to represent an alternate but rather complementary approach to disease management in these patients. Future studies should evaluate whether TCM use is associated with disease activity and outcomes over time.

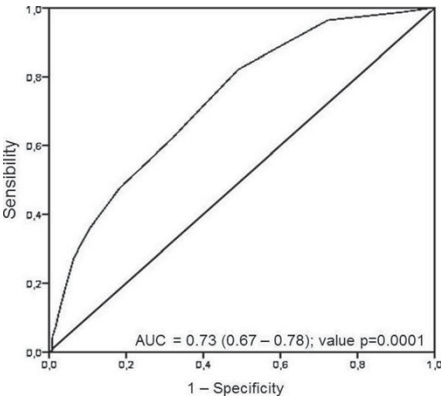
AB1095 EARLY DIAGNOSIS AND TREATMENT OF CHRONIC DISEASES: NATIONAL REVIEW AND GUIDELINES - RA AS AN EXAMPLE

L. Euller Ziegler on behalf of the High Council for Public Health (HCSP).
Rheumatology Department, Academic Hospital and University of Nice, Nice, France

Background: Managing the increasing burden of chronic diseases is a major public health problem. Are early diagnosis and management a key point for their optimal care and outcome?
Objectives: Assessing early diagnosis and management of chronic diseases was the aim of a study carried out by the High Council for Public Health (HCSP), independent national body gathering experts nominated by the Minister of Health, to provide health authorities with expertise on development of national public health goals, assess their achievement and contribute to their monitoring
Methods: A multidisciplinary working party run within the HCSP a review of scientific data supporting early intervention benefits, as well as frequency, impact and mechanisms of delayed management on individuals and society, in order to produce national guidelines. A huge amount of data were analyzed:argued contributions from national Professional organizations and Patient associations, literature analysis, audition of national agencies representatives.
Results: Early stages of chronic diseases are less studied than later ones.Nevertheless, there is a strong evidence that delayed diagnosis and management are frequent and often adversely affect patients and society. The frequency, length and burden of delayed care were analyzed, varying with each disease, availability of efficient treatments and guidelines, socio-economic context. Optimal time for adequate management from symptom onset was reviewed, as well as medico-economic studies
Rheumatologic disorders appeared as models, notably Rheumatoid Arthritis (well-established window of opportunity, international guidelines for early diagnosis and management, including T2T and patient active implication). Evidence for early treatment benefit was also found for spondyloarthritis, osteoporosis, obstructive sleep apnea syndrome, chronic obstructive pulmonary disease, renal insufficiency, autism spectrum disorders, bipolar disorders, ... Ethical considerations may arise; in Alzheimer's disease, a diagnosis source of marked anxiety, there is no effective pharmacological treatment- but non pharmacological treatments are quite helpful for patients and family and therefore recommended by health authorities.
Obviously, the benefit of early intervention must be strongly assessed. When this benefit is proven, too many patients are facing delays, often long, with adverse consequences and increased burden for society. The mechanisms of such delayed management are multiple and often intricate; we analyzed the barriers to optimal care linked with professionals, patients, family, health system and society, in order to identify the ways to optimize the outcomes and therefore improve the global health status of the population.
Finally the HCSP established a set of guidelines, in 3 axis



- disseminate widely the available knowledge among professionals, patients, the general public, taking into account the social poor perception of chronic diseases
- implement effectively change in practice toward early treatment, when appropriate:timely coordination between professionals and patient, fair diagnosis announcement, early patient implication, fight against social health inequalities
- develop research on early stages of chronic diseases, diagnosis, management and outcomes.

Conclusions: From a national public health perspective, early diagnosis and management, in the chronic diseases where their benefit is proven, should be better known and effectively implemented.

AB1096 TIMED UP AND GO TEST (TUG) FOR SARCOPENIA SCREENING

L.I. Filippin[1], V.O.N. Teixeira[2], N.C. Oliviera[3], D.D. Berwanger[4], F. Miraglia[1].
[1]Program Post-graduat Saúde e Desenvolvimento Humano, Centro Universitário la Salle, Canoas/RS, Canoas; [2]Post-doctoral Fellow, Universidade Federal de Ciências da Saúde de Porto Alegre, Porto Alegre; [3]Physiotherapy Graduate; [4]Physical Education Graduate, Centro Universitário la Salle, Canoas/RS, Canoas, Brazil

Background: Sarcopenia is a multifactorial syndrome characterized by a decrease of muscle mass and force together with functional performance impairment. Sarcopenia has been described as an independent predictor factor of health adverse outcomes such as falls, decreased quality of life, enhanced risk of death and higher treatment costs. However, there are just a few screening tolls of low cost and easy applicability to detect sarcopenia. In this context, a standard mobility assessment such as the TUG test has recently been described as a predictor of sarcopenia.
Objectives: To evaluate the performance of *timed up and go test* (TUG) as a screening toll for sarcopenia in the elderly.
Methods: This is a cross-sectional home study with 211 elderly participants of the South Region of Brazil. Sarcopenia diagnosis criteria was based on the European Working Group on Sarcopenia in Older People (EWGSOP). Individuals that presented low muscle mass (women: $\leq$6.37kg/m^2 and men: $\leq$8.90kg/m^2) added to decreased handgrip strength (women: $<$20kgf and men: $<$30kgf) and/or walking speed ($\leq$0.8m/s) were considered sarcopenic. TUG test quantifies functional mobility through the task of getting up from a chair, walking 3m and come back to sit on the chair.
Results: Based on EGWSOP criteria for sarcopenia, 17.1% (n=36) received the sarcopenia diagnosis. A ROC curve was constructed to evaluate the discriminatory power of TUG (AUC: 0.73 [IC 0.67 – 0.78; p=0.0001]). TUG test presented high sensibility (88.9%) and negative predictive values (93.2%), with a cutoff point of 7.5 seconds (figure 1).

Conclusions: Detecting the beginning of sarcopenia could allow for early interventions and slow the syndrome process, preventing further hospitalizations and economic burden. In this context, TUG is an easy, fast and low-cost test with high sensibility for sarcopenia detection that could be used as screening toll for this syndrome.

AB1097 PATIENTS' EXPERIENCES OF REMOTE MONITORING OF RHEUMATOID ARTHRITIS USING A SMARTPHONE APP

L. Austin[1], C. Sanders[1], W. Dixon[2]. *[1]Centre for Primary Care, Faculty of Biology, Medicine and Health, Manchester Academic Health Science Centre; [2]Arthritis UK Centre for Epidemiology, Centre for Musculoskeletal Research, Faculty of Biology, Medicine and Health, Manchester Academic Health Science Centre, University of Manchester, Manchester, United Kingdom*

Background: The care of patients with Rheumatoid Arthritis (RA) is guided by monitoring changes in disease activity. However, whilst a number of patient-related outcome measures (PROMS) exist[1], they are not collected on an on-going basis. Consequently, there are few objective measurements of disease activity, between clinic visits, to inform treatment decisions. In response to this, the REMORA study (REmote MOnitoring of Rheumatoid Arthritis) is developing a smartphone app, to capture data on disease activity and integrate it directly into the electronic patient record. The project explores whether on-going collection of electronic patient-reported outcomes (ePROS) between clinic visits can enhance clinical care, support patient self-management, and provide a sustainable source of data for research.
Objectives: To describe patients' experiences of remote monitoring of their disease activity, and the perceived value in relation to clinical consultations and self-management.
Methods: A diverse sample of 20 patients with RA entered data into the app over

a three month period in response to daily, weekly and monthly question sets (table 1). An optional diary component was included, but not integrated into the EPR. The ePROS had been determined during earlier interviews with rheumatology patients, practitioners and researchers.
Qualitative interviews were conducted with patients at the end of the three month period. Interviews explored patients' views on the components of the app, and perceived implications for self-management and clinical care. Interviews were transcribed and analysed thematically.
Results: Qualitative analysis of the data identified a number of themes including; the benefits and limitations of using scales to reflect changes in symptoms experienced, the value of the diary for providing contextual information and an *"outlet"* for feelings, and the impact the data made to their clinical consultation and self-management.
Overall, the collection of longitudinal data was seen as useful by patients. Successful integration with the EPR allowed data to be displayed graphically during clinical consultations. Reviewing remote monitoring data detected changes which may otherwise have been missed such as flares in disease, or gradual improvements in response to new treatments. Data therefore facilitated "*a shared conversation*" and decision making around treatment plans.
Additionally, being able to self-reflect on data recorded enabled patients to identify triggers and alleviators in relation to their disease activity and take steps to self-manage their RA; for example, by recognising when they needed to rest as opposed to *"just carrying on"* when their symptoms were more severe.

Table 1. ePROS

Daily	Pain, difficulty with physical activities, fatigue, sleep difficulties, physical wellbeing, emotional wellbeing, coping
	Morning stiffness
Weekly	Number of tender & swollen joints
	Global assessment of wellbeing
	Employment status
	Impact on number of hours worked
	Experienced a flare
	Description of flare
Monthly	Health Assessment Questionnaire (HAQ) impact of disease on daily activities.

Conclusions: The app was well received by patients and feedback suggests that the ePROS recorded can capture changes in disease activity in a manner that is meaningful to patients and facilitates both clinical consultations and self-management.

AB1098 TEMPORARY WORK DISABILITY CAUSED BY MUSCULOSKELETAL DISEASES AT THE HOSPITAL CLÍNICO UNIVERSITARIO DE VALLADOLID: 6 MONTHS EXPERIENCE

M.D. Sánchez González [1], C.C. Macía Villa [2], C. González-Montagut Gómez [1], J. Medina Luezas [1]. *[1]Rheumatology, Hospital Clínico Universitario de Valladolid, Valladolid; [2]Rheumatology, Hospital Universitario Severo Ochoa, Leganés (Madrid), Spain*

Background: Musculoskeletal diseases are the leading cause of disability in the world and have a high impact on direct (health) and indirect (labor) costs. Labor casualties in Spain, when temporary, are known as temporary work disability (TWD). Since 2013, follow-up of patients with TWD (when the origin of the disease is a musculoskeletal condition) is being carried out in a monographic consultation within the external consultations of the Rheumatology Service of the Hospital Clínico Universitario de Valladolid.
Objectives: To describe the experience of the last 6 months in the consultation of temporary musculoskeletal incapacities (TWDMSDs) of the Hospital Clínico Universitario de Valladolid.
Methods: The TWDMSDs consultation is operational 2 days a week. The referral system is direct from Medical Inspection via email (1st part confirmatory work leave). The patients come from 7 Health Centers (population 82,000 people). The agenda is configured daily according to the emails sent, contacting the patients by telephone, excluding those with trauma, surgeries, pregnancies, non-localized, rejection or discharge. The assessment of the patients in consultation, according to usual clinical practice. A medical report is issued (medical history, physical examination, completed or requested tests, recommendations and treatment). The data are collected in SPSS, proceeding to its subsequent analysis.
Results: During the last six months of follow-up, 354 emails have been received. A total of 106 patients were evaluated, with the following characteristics: 54.3% women and 45.7% men, mean age 43.4 years, 95% performed physical work. Axial pathology was observed in 67.8% of cases and peripheral in 32.2%. The patients evaluated with some rheumatic pathology reached 96%. The average delay from the start of the work leave to the email was 12.2 days, and from the start of the work leave to the first consultation of 6.7 days (including weekends). 65.4% of the patients were discharged from the TWDMSDs agenda in the 1st consultation, without requiring interconsultations or requests for diagnostic tests, with an infiltration of 8% of the patients, arthrocentesis at 2%, ultrasound at 28% and Exercise guidelines were given to 76% of patients. The mean number of consultations up to discharge was 1.3. The mean time from onset of discharge to discharge was 21.1 days and from the first consultation until discharge by Rheumatology was 6.6 days.
Conclusions: The TWDMSDs consultation makes possible the early detection of rheumatologic musculoskeletal pathology, allowing an early action that minimizes the number of requested tests and interconsults generated and achieves an early diagnosis and treatment of patients, with the consequent benefits that this entails. The patients evaluated in consultation are mainly of average age, with physical work, mechanical pathology, resolution of the problem that causes the TWD and reincorporation to the working life of early form. In the discharge report, recommendations are included to minimize future casualties (work refocus, orthotics, exercises, treatment regimens in the event of a recurrence of symptoms) and explain the importance of being actively involved in their pathology to prevent progression.

AB1099 COUNSELLING ON FAMILY PLANNING AND CONTRACEPTION, AND PREGNANCY OUTCOME IN WOMEN WITH RHEUMATIC DISEASES: A NATIONAL SURVEY OF 398 PATIENT-REPORTED QUESTIONNAIRES FROM 24 RHEUMATOLOGY CENTERS

M.G. Lazzaroni [1], F. Dall'Ara [1], L. Andreoli [1], C. Carini [1], M. Rodrigues [2], R. Reggia [1], E. Bartoloni-Bocci [3], R. Gerli [3], C.B. Chighizola [4], M. Gerosa [4], P.L. Meroni [4], L. Minisola [5], A. Brucato [13], V. Ramoni [14], R. Caporali [14], C. Montecucco [14], C. Tani [15], M. Mosca [15], M. Trevisani [16], N. Malavolta [16], M. Vadacca [5], A. Afeltra [5], E. Vivaldelli [17], A. Maier [17], E. Baldissera [4], E. Visalli [18], R. Foti [18], L. Zuliani [19], A. Gabrielli [19], N. Romeo [20], A. Tincani [1]. *[1]Brescia, Italy; [2]Coimbra, Portugal; [3]Perugia; [4]Milano; [5]Roma; [6]Foggia; [7]Potenza; [8]Padova; [9]Genova; [10]Ferrara; [11]Reggio-Emilia; [12]Trento; [13]Bergamo; [14]Pavia; [15]Pisa; [16]Bologna; [17]Bolzano; [18]Catania; [19]Ancona; [20]Cuneo, Italy*

Background: Rheumatic diseases (RD) predominantly affect young women during reproductive age. Pregnancy, contraception and family planning (FP) are crucial for the quality of life of these patients.
Objectives: We aimed to investigate 'women's health' through a self-reported questionnaire. Answers from patients with connective tissue diseases (CTD) vs chronic arthritis (CA) were compared.
Methods: 24 centres distributed the questionnaire (65 multiple-choice and 12 open-answer questions) to women with RD (18–45years) regularly attending their outpatient clinics.
Results: Answers were collected from 249 CTD vs 149 CA patients. Their desire to have children was influenced by RD in 40% of cases: half of them reduced the number of children they wanted (Table 1). 39% CA vs 29% CTD were afraid of being mother because of disability.
24% CTD vs. 18% CA had at least one miscarriage; 21% CTD vs. 2% CA had more than one.
31% CTD and 34% CA were never asked about their desire to have children. 61% CTD vs 70% CA received counselling about contraception, given by a gynaecologist (G) (58% vs 64%), rheumatologist (R) (22% vs 14%) or both (7% vs 9%). 60% in both groups received a counselling before pregnancy: 34% vs 39% from R and G, 14% vs 22% by R. This positively changed family planning in 64% vs 59%. We created a Knowledge Index (based on the average of the normalized performed scores on 6 key questions for different sections): 55% CTD patients vs 44% CA had a medium-high score. A higher score directly correlated with the desire to became pregnant and with a multidisciplinary counselling.

The disease has reduced your desire to have children?

	CTD	CA
NO	36/91 (40%)	22/54 (41%)
YES	52/91 (57%)	28/54 (52%)
No Answer	3/91 (3%)	4/54 (7%)

If yes, I reduced the number of children that I wanted, because I was afraid...	CTD	CA
...of not being able to take care of them because of the disease	26/91 (29%)	21/54 (39%)
...that the child could have the same disease	15/91 (17%)	8/54 (15%)
...that drugs or disease could harm the baby	26/91 (29%)	20/54 (37%)

Table 1. Reasons for reduced family size in patients who declared that their RD had influenced their desire of having children

Conclusions: This survey suggested that CTD have a major impact on FP and family size, possibly mediated by the increased rate of miscarriages as compared to CA. Concerns about reproductive issues could be positively overcome by adequate counselling.
Rheumatologists should implement the discussion about FP and the compatibility of drugs with pregnancy in the management of young women with RD, especially those with CTD for whom contraception and pregnancy have particular implications.

AB1100 PATIENT SELF-MANAGEMENT APPS AS ONE MODULE OF AN INTEGRATED TIGHT-CONTROL CONCEPT BASED ON THE EXAMPLES OF THE DIGITAL APPLICATIONS RHEUMALIVE UND AXSPALIVE

M. Feuchtenberger[1], S. Kleinert[2], F. Schuch[2], S. Spähtling-Mestekemper[3], C. Kuhn[4], M. Welcker[5]. *[1]Rheumatologie, Schwerpunktpraxis für Rheumatologie, Burghausen; [2]Rheumatologie, Rheumatologische Schwerpunktpraxis, Erlangen; [3]Rheumatologie, Rheumapraxis München-Pasing, München; [4]Rheumatologie, internistische Schwerpunktpraxis am Ludwigsplatz, Karlsruhe; [5]Rheumatologie, MVZ für Rheumatologie Dr. Martin Welcker, Planegg, Germany*

Background: Medical Applications have the potential to support physicians and patients to document the course of the disease and optimize therapies. We describe the linkage and integration of patient reported outcomes (PROs) into existing medical office software and rheumatologic documentation systems by means of the digital applications RheumaLive and AxSpALive. RheumaLive is certified as medical product class I, and certification for AxSpALive is in preparation.
Methods: RheumaLive and AxSpALive are applications that can be downloaded free of charge from the common app-stores (Android, Apple) and installed on mobile devices (smartphones, tablets). A freeware version for PCs is also available (Windows- und Mac OS X-Version). A diary functionality allows to document the medication uptake (partially filed, memory-functionality for medication uptake available), validated scores like VAS, SJC, morning stiffness, FFBh (comparable to HAQ), BASDAI, RADAI, etc. and days of sick leave (+/- related to the rheumatic disease). All App-versions are password-protected, which is provided by the treating rheumatologist (relationship patient-physician).
The patient reported outcomes are stored locally on the respective device. For the subsequent visit, they can be printed or sent encrypted to the treating physician via internet in a prespecified interval. A specific software allows to integrate the data into the existing medical office software.
In daily practise, data entered by patients into RheumaLive can be screened and compared with collected clinical data and laboratory measures, because of it's certification as medical product. In case of an increasing disease activity the patient can be rapidly contacted and medication can be modified, if necessary. Regular F2F-appointments remain integral part of the medical care, even in case of good controlled disease activity. But in case of F2F-appointments, PROs can be delivered by patients, saving time and resources.
The PROs can be made available to rheumatologic documentation systems like RheumaDok via predefined interfaces.
Results: In a first pilot phase 54 patients in 4 rheumatologic specialised practices were documented. In the next phase the number of patients and participating practices/centres shall be increased.
Further studies are necessary to show if the integration of PROs which are collected via electronical application can lead to an improvement of rheumatologic diseases.
Conclusions: The integration of PROs collected with RheumaLive and AxSpALive into existing rheumalogic documentation systems allows a close monitoring of disease courses and therapies according to the "tight control" principle.
Acknowledgements: RheumaLive and AxSpALive werde developed by Starhealth GmbH on behalf of UCB Pharma GmbH.

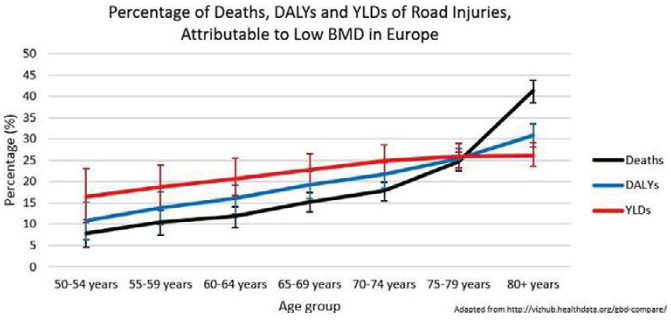
AB1101 QUALITY OF LIFE AND WORK IN PATIENTS WITH ANKYLOSING SPONDYLITIS OF WORKING AGE



M. Parvu[1], G.M. Muresan[2], A.I. Cozos[3], I.A. Biro[1], H.V. Popoviciu[1], S. Szasz[1], S. Voidazan[4]. *[1]Rheumatology, Rehabilitation, University of Medicine and Pharmacy Tg.Mures, Emergency County Hospital; [2]Internal Medicine; [3]Rheumatology, Rehabilitation, Emergency County Hospital; [4]Epidemiology, University of Medicine and Pharmacy, Tg.Mures, Romania*

Background: The assessment of the quality of life is a current research issue in patients with ankylosis spondylitis[1,2]. The tools for assessing the life quality, come to complete the other methods of investigation, which assess in a subjective manner the negative impact of the disease on daily activities.
Objectives: The purpose of this study is to define the functional ability, the disease activity, to investigate the correlation between work and quality of life, and the impact of the quality of life in patients with AS.
Methods: The study is an observational prospective study, which includes a total of 91 patients defined with AS in according to the modified New York criteria, from the Rheumatology Clinic of Targu-Mures. Data were obtained by questionnaires including several generic and disease related Quality of life tools. It includes specific tools: BASDAI (Bath Ankylosing Spondylitis Disease Activity Index); BASFI (Bath Ankylosing Spondylitis Functional Index); ASQOL (Ankylosing Spondylitis Quality of Life); and generic tools:SF-36 (Short-Form 36), Eq 5D (European-Quality of life 5 Dimensions), HAQ (Health Assessment Questionnaire and VAS (Visual Analogue Scale).
Results: Out of 91 patients, 82% were males, 18% were females; mean age (years) 50,27±11,05SD; age at disease onset (years)36,20±13,51SD; duration of disease (years) 14,22±9,69SD; retiring mean age (years) 44,54±7,65SD. The mean values for BASDAI=4,23±2,21SD; BASFI=4,88±2,61SD; EQ-5D=5,71±0,20SD; EQ-VAS=64,26±18,938D; HAQ=0,747±0,51SD; SF-physical summary=33,53±8,33SD; SF-emotional summary=47,57±10,03SD; ASQOL=6,94±2,68SD. We found a positive correlation between the disease onset and retiring age $p<0,0001$, r=0,731a nd a negative significant correlation between BASFI and SFphysical summary ($p<0,0001$, r=-0,798), ASQOL and SF-emotional summary, $p<0,0001$, r=-0,595).
Conclusions: The results showed the invalidant potential of the AS, with major impact upon the quality of life.

AB1102 LOW BONE MINERAL DENSITY IS A MAJOR CONTRIBUTOR IN THE EUROPEAN HEALTH BURDEN DUE TO ROAD TRAFFIC ACCIDENTS IN PEOPLE AGED 50 YEARS AND ABOVE

N. Wilson[1], L. Sanchez-Riera[2], D. Prieto-Alhambra[3], C. Cooper[4], K. Dreinhöfer[5], A. Woolf[6], L. March[1], P. Halbout[7]. *[1]Institute of Bone and Joint Research, University of Sydney, Sydney, Australia; [2]University Hospital Bristol NHS Foundation Trust, Bristol; [3]Oxford NIHR Musculoskeletal Biomedical Research Unit, University of Oxford, Oxford; [4]MRC Lifecourse Epidemiology Unit, University of Southampton, Southampton, United Kingdom; [5]Center for Musculoskeletal Surgery, Charité Universitätsmedizin, Berlin, Germany; [6]Institute of Health Research, University of Exeter Medical School, Exeter, United Kingdom; [7]International Osteoporosis Foundation, Nyon, Switzerland*

Background: Road traffic accidents (RTAs) are the second leading injury health burden and cause of death in Europe, after falls (1). A significant but as yet unreported proportion of such burden is potentially due to low bone mineral density (BMD), especially among older people, through its relationship with fractures.
Objectives: To measure the percentage of deaths, disability-adjusted life years (DALYs) and years lived with disability (YLDs) due to RTA in people aged 50 years and above attributable to low BMD in the European population for the year 2015.
Methods: The estimates followed the Counterfactual Risk Assessment Methodology used in the GBD study (1). Systematic review was performed seeking population-based studies with femoral neck BMD (FNBMD) measured by Dual-X-Ray-Absorptiometry in people 50 years and over. Age- and sex- specific levels of mean +/-SD FNBMD (g/cm^2) were extracted from eligible studies, and this was used as the exposure variable. The age and sex-specific 99th percentile from non-Hispanic whites in National Health and Nutrition Examination Survey (NHANES) 2009–2010 was used as theoretical minimum risk factor exposure distribution, to estimate the potential impact fraction (PIF) of FNBMD for fractures. Relative risks of FNBMD for fractures were obtained from a previous meta-analysis (2). Attributable deaths due to RTA-related fractures were obtained through coded hospital data. Disability levels were established by applying disability weights to each type of fracture. Then, PIFs were applied to obtain attributable deaths and disability due to low BMD.
Results: In the European population aged 50–69 and 70 years and above, 10.8% (95% CI: 8.9–12.4%) and 30.9% (29.1–32.4%) of RTA-related deaths, respectively, were attributable to low BMD. In the age group 50–69 this was the second most important risk factor following alcohol use and in those 70 years and above became the most important risk factor, with double the weight of alcohol use. This represents 2,537 and 5,460 absolute deaths in those aged 50–69 and 70 years and above, respectively. The percentage of health burden and disability caused by RTAs attributable to low BMD grew steadily from the ages of 50 and onwards.
Conclusions: This data shows the non-previously reported important role of low BMD as a preventable risk factor for European RTAs' health burden in population 50 years and over, which requires urgent attention.

AB1103 THE IMPORTANCE OF ADEQUATE SCREENING TO AVOID FALSE POSITIVES IN THE DIAGNOSIS OF RHEUMATOID ARTHRITIS

P. Santos-Moreno[1], D. Gomez[1], E. Castillo[1], R. Giraldo[1], G. Ballesteros[1], L. Villarreal[2], D. Buitrago-Garcia[3], J. Bello[3]. *[1]Rheumatology; [2]Psychology and processes; [3]Epidemiology, Biomab, Center for Rheumatoid Arthritis, Bogota, Bogota, Colombia*

Background: The lack of expertise and skills in the diagnosis of in rheumatoid arthritis (RA) in primary level of Colombian medical centers can cause misdiagnosis of rheumatic diseases. Due to this issue in a specialized center in RA we stablished a multidisciplinary model and a strict disease management algorithm to diagnose properly our patients; as a consequence we have achieved the accurate diagnosis of great proportion of patients that were false positives diagnosed initially as RA.
Objectives: The aim of this study was to show effectiveness and accuracy of a screening method to avoid false-positive diagnosis of RA in a cohort of patients with supposed diagnosis of RA.
Methods: During two years we evaluated patients with presumptive diagnosis of RA. We conducted a cross-sectional study; we included patients who were referred from primary care centers to a RA specialized center in a 24 month period with presumptive diagnosis of (RA). Each patient was evaluated to confirm or rule-out diagnosis of RA as follows: a rheumatologist fulfilled a complete medical record, including joint counts; it was assessed rheumatoid factor and anti-citrullinated antibodies, and other laboratories depending on each case. Also were made x-rays of hands and feet, and in some cases of persistent doubt about the diagnosis was requested comparative MRI of hands or/and feet. Descriptive epidemiology was perfomed.
Results: Between 2015 and 2016 6813 patients were evaluated in our specialized center, in 76% of cases RA was confirmed, the remaining 1593 patients (24%) had a wrong diagnosis of RA; of these misdiagnosed patients, (87%) were female, and 205 (13%) male, with an average age of 62±12 years. Between differential diagnosis which were found in this cohort of misdiagnosed patients: osteoarthritis in 849 patients (63.3%), Sjögren syndrome (7%) Systemic lupus erythematosus (6%) the remaining 30% of patients had conditions such as gout, psoriasis, osteoporosis, myalgia, soft tissue diseases among others. The majority of patients with wrong diagnosis took DMARDs (23%), calcium (11%), biologics (10%) acetaminophen (9%), neuropathy medications (7%), acetaminophen plus opioids (5%), osteoporosis medications (5%), opioids (4%), glucosamine (4%), diacerein (3%), the remaining patients took medications such as NSAID, glucosamine, antigout agents, gastritis drugs, among others.
Conclusions: The results of this program show that almost 25% patients with presumptive RA diagnosis are misdiagnosed; this is evidence that can be extrapolated to primary care centers in Colombia. The most important cofounding diagnosis was osteoarthritis and many patients were receiving DMARDs for treatment. For this reason there is an urgent need of education strategies for primary care physicians and the implementation of centers of excellence in RA, in order to conduct a proper diagnose and avoid clinical and health economics consequences of misdiagnosis.

AB1104 COST-EFFECTIVENES ANALYSIS OF TNF INHIBITORS USE COMPARED TO DMARDS IN THE FATAL AND NONFATAL ACUTE CORONARY ISCHEMIC EVENT

R.K.S. Gomes[1], J.Y.K. Viscondi[2], M.R.C. Nobre[2]. *[1]Center of specialty of the municipality of Blumenau and Brusque, Blumenau; [2]São Paulo University, São Paulo, Brazil*

Background: Epidemiological studies have established that rheumatoid arthritis is associated with an increase in cardiovascular disease[1,2]. The evaluation of tumour necrosis factor inhibitors (TNFi) on the reduction of the risk of acute myocardial infarction and death due to cardiovascular causes has shown promising results[3]. The economic evaluation for these outcomes are not established yet.
Objectives: To evaluate the cost-effectiveness of TNFi versus disease-modifying antirheumatic drugs (Dmards) to avoid a new case of acute ischemic heart disease and death in rheumatoid arthritis patients.
Methods: A cost-effectivenes analysis (CEA) was performed using a Markov model 6-month transition cycle, with time horizon of 30 years, under the Brazilian public healthcare system perspective. Costs are expressed in 2015 Reais and effectiveness measures are new cases of acute ischemic coronary disease and cardiovascular death.
Results: The average cost in 30 years of Dmards and TNFi was 14,291,105.28 and 96,151,873.86 Reais, respectively. The incremental effectiveness was 2.69 cases of coronary artery disease and consequent incremental cost-effectiveness ratio (ICER) of 30,527,502.27 Reais per new cases avoided, while for cardiovascular death, incremental effectiveness was 1.33 and an ICER of 61,634,231,69 Reais per new cases avoided. The univariate analysis identified that the most relevant parameter in the ICER on both outcomes was the TNFi drug. The sensitivity analysis established that, in order to, reach the amount of willingness to pay (WTP) per semester to avoid an acute myocardial infarction, the average cost of TNFi should be 1,337.47 Reais per case avoided and the average cost for the cardiovascular death avoidence sould be 954.22 Reais. All the analyzes performed establish an unfavorable relationship of the drug treatment strategy with TNFi.
Conclusions: The findings of the CEA among patients with rheumatoid arthritis for cardiovascular outcomes when compared to the strategy of TNFi drug treatment with the dominant strategy Dmards after the first 6 months of exposure point out an unfavorable relationship, surpassing the amount of expenses recommended by the Ministry of Health of Brazil in the year 2015.

AB1105 FACTORS IMPACTING PATIENTS' DECISION TO START TREATMENT VARY BY RACE

R. Cozmuta[1], L. Fraenkel[2]. *[1]Rheumatology, Emory University, Atlanta; [2]Yale University, New Haven, United States*

Background: Previous research has found that young minority women tend to be more risk averse compared to their Caucasian counterparts. The reasons underlying these differences, however, are not understood.
Objectives: The objective of this study was to examine whether factors influencing perceived treatment importance vary by race.
Methods: Women between the ages of 20 and 45 completed a survey. The survey recorded sociodemographic data, trust in healthcare systems and beliefs in medications. It also included a hypothetical scenario in which subjects were asked to rate the importance of taking a medication for a patient with joint pain, migraines and fatigue that benefits 70% of people and is well tolerated except for the rare risk (1 per 100,000) of a neurologic disease that may cause weakness, trouble with vision and numbness. Associations between patient characteristics, medication beliefs, and trust with perceived importance of taking the medication were evaluated for each race. Variables found to be statistically significant were subsequently evaluated using multiple linear regression.
Results: 299 women completed the survey. Baseline characteristics by ethnicity are described in Table 1.Hispanic women had more negative medication beliefs than did Non-Hispanic Whites, and both Non-Hispanic Black and Hispanic

Table 1. Patient characteristics by race

Variable	Non-Hispanic White	Non-Hispanic Black	Hispanic	P value
Age (mean, SD)	34.1 (7.2)	35.2 (8.4)	32.8 (8.6)	0.1
Poor self-reported health (%)	12	14	12	0.9
Some college education (%)	75	61	43	**<0.01**
Income <12,000/year (%)	23	33	34	0.2
Difficulty paying for meds (%)	68	58	60	0.3
Medication beliefs (mean, SD)	20.6 (4.6)	21.6 (4.4)	22.3 (4.7)	**0.04**
Trust (mean, SD)	27.9 (5.5)	28.6 (5.7)	29.1 (5.5)	0.3
Hopeful (mean, SD)	4.2 (1.6)	3.5 (1.7)	3.6 (1.7)	**<0.01**
Worried (mean, SD)	4.6 (1.6)	4.8 (1.8)	5.1 (1.6)	0.2
Important (mean, SD)	5.3	5.6	5.5	0.3

Table 2. Association of subject characteristics with perceived importance by race

Variable	Non-Hispanic Whites	Non-Hispanic Blacks	Hispanics
Medication beliefs[1]	- 0.55 (**<0.01**)	-0.24 (**0.01**)	-0.08 (0.46)
Hopeful[1]	0.54 (**<0.01**)	0.16 (0.09)	0.37 (**<0.01**)
Worried[1]	- 0.27 (**0.01**)	-0.02 (0.87)	0.05 (0.66)
Trust[1]	0.22 (**0.02**)	0.33 (**0.01**)	0.17 (0.11)
Poor self-reported health[2]	1.66 (0.10)	1.19 (0.25)	-1.4 (0.16)
Some college education[2]	-1.16 (0.25)	1.9 (0.06)	0.65 (0.52)
Income <12,000/year[2]	0.38 (0.71)	1.65 (0.11)	0.06 (0.96)
Difficulty paying for meds[2]	0.00 (0.99)	-2.05 (**0.04**)	-0.42 (0.68)

[1]Correlation coefficient (p value); [2]T-test (p value).

subjects had lower levels of hope compared to Non-Hispanic White subjects (difference between means <0.05). Associations between subject characteristics and perceived importance of taking the medication are presented in Table 2. In a multilinear regression model (including education, difficulty paying for medications, medication beliefs, trust, hope and worry), hope was associated with perceived importance of taking the medication in all three ethnic groups. Additional findings differed by race, with medication beliefs in Non-Hispanic White subjects; difficulty paying for medications in Non-Hispanic Black subjects, and worry in Hispanic subjects being associated with perceived importance of taking the medication.

Conclusions: Our findings confirm the important influence of emotion on decision making, and suggest that while hope is universally associated with perceived importance of taking a medication, other factors differed, highlighting differences in the decision making process across ethnic groups.

AB1106 VERBAL PATIENT EDUCATION ON VACCINATION IN ADULTS WITH AUTOIMMUNE INFLAMMATORY RHEUMATIC DISEASES: IS IT ENOUGH TO IMPROVE VACCINATION RATES?

R. Magro, M. Rogers, F. Camilleri. *Rheumatology, Mater Dei Hospital, Msida, Malta*

Background: Patients suffering from autoimmune inflammatory rheumatic diseases (AIIRD) are at increased risk of infections, due to the underlying condition and its treatment. A study on vaccination in AIIRD carried out at Mater Dei Hospital, Malta in 2015, showed that 37.9% of the patients received the influenza vaccine in the previous year and 8.3% had received the pneumococcal vaccine ever. Only 38.3% knew that they had an increased risk of infection because of their condition.

Objectives: The aim of the current study was to establish whether verbal education on vaccination, influenced patients' vaccination rates in the following year. A further aim was to determine whether the patients had a better understanding of their increased infection risk following verbal education.

Methods: The initial study carried out in 2015 consisted of a short face-to-face interview with 60 patients who suffered from autoimmune inflammatory rheumatic diseases. Following the interview, verbal information was given to the patients on their increased risk of infection, and the importance of vaccination, in particular the influenza and pneumococcal vaccine. After 1 year, the patients were contacted by means of a telephone call. They were interviewed with regards to their vaccination history and knowledge of their infection risk. Of the 60 patients, 2 had passed away. Therefore 58 patients were included in the study.

Results: The study included patients with a variety of AIIRD including rheumatoid arthrtitis, ankylosing spondylitis and psoriatic arthritis. 60.3% were females and the mean age was 63.1 years (range 25 to 82 years). Influenza vaccination rates in the previous year improved from 37.9% in 2015 to 41.4% in 2016 (p=0.704). Pneumococcal vaccination rates improved from 6.9% to 17.2% (p=0.086). On questioning the patients regarding their knowledge of increased infection risk, there was no improvement following the verbal education. In fact 37.9% of patients questioned in 2015, and 34.5% in 2016 knew that they were at increased risk of infection because of their condition. 33% of patients studied in 2016 could recall that they had been advised to take vaccination because of their underlying condition or treatment. This improved from 7% in 2015 (p<0.005). The proportion of patients who could recall the vaccination advice given was significantly higher in those below 61 years (p<0.005). However, there were no significant gender difference (p=0.147).

Conclusions: Verbal education resulted in more patients receiving the pneumococcal vaccination (although not statistically significant because of the small number involved). It also resulted in a significant increase in the number of patients who were able to recall that they were adviced to take vaccination because of their condition. However, only 33% could recall this after a year. Verbal education did not effect the number of patients who took the influenza vaccine and the patients' knowledge of their increased infection risk.

This study highlights that verbal education helps to improve vaccination rates in autoimmune inflammatory rheumatic diseases. However, the advice given tends to be forgotten by the majority of patients after one year. Thus repeated verbal education is necessary, particularly in elderly patients. Moreover other methods of education, such as written information in the form of leaflets, may be useful.

AB1107 ASSESSMENT OF AGREEMENT BETWEEN SELF-REPORT INFLAMMATORY ARTHRITIS SYMPTOMS AND CORRESPONDING GP DIAGNOSIS IN PATIENTS WITH PMR

S.L. Hider[1,2], M. Blagojevic-Bucknall[2], S. Muller[2], K. Clarkson[2], C. Mallen[2]. *[1]Haywood Academic Rheumatology Centre, Haywood Hospital, Staffordshire; [2]Arthritis Research UK Primary Care Centre, Keele University, Keele, United Kingdom*

Background: Polymyalgia rheumatica (PMR) is the commonest inflammatory condition among those aged 50 years and over, with a lifetime risk of 2.4% in females and 1.7% in males. Seronegative rheumatoid arthritis is an important differential diagnosis. It is thought a proportion of PMR patients develop an inflammatory arthritis, although prevalence estimates vary.

Objectives: To determine the proportion of PMR patients (1) reporting symptoms of possible inflammatory arthritis using a validated self-report inflammatory arthritis algorithm; and (2) who subsequently receive a diagnosis of inflammatory arthritis in their primary care medical records.

Methods: A cross-sectional questionnaire study was developed to investigate impact of PMR in primary care patients. All eligible adults aged ≥50 years, registered with one of 150 participating practices with a first ever Read coded diagnosis of PMR in the last 3 years were mailed a questionnaire including items about socio-demographics, PMR characteristics, joint problems and comorbid conditions. Self-reported inflammatory arthritis (IA) was defined using a validated scoring algorithm (1) with positive responses coded as 1 and negative responses as -1; a score >0 is regarded as predictive of IA. IA score was calculated for those patients that had complete data on all required variables. A list of Read Codes relating to inflammatory arthritis, compiled by a rheumatologist and a GP, were searched for in primary care medical records of consenting respondents. Period of interest was from date of first ever PMR diagnosis in the medical records until survey mail-out.

Results: 704 eligible patients were identified and sent a questionnaire, with 550 (78%) responding. Responders and non-responders did not differ significantly by age or gender. Medical records could be obtained for 385 patients, of whom 310 completed the questionnaire fully and were included in the analysis. IA score ranged from -8.4 to 2.5, with 21 (7%) patients being classed as having a positive IA score. 8 out of 310 patients had at least one inflammatory arthritis Read code recorded from date of first diagnosis of PMR in their medical record, although only 2 of these also fulfilled the self-report IA criteria.

Conclusions: In this PMR cohort the proportion subsequently diagnosed with an inflammatory arthritis was low (2.5%) although more patients reported inflammatory symptoms. The agreement between self-reported inflammatory symptoms and Read Code diagnosed inflammatory arthritis was low.

AB1108 HANDLING OF DE NOVO ARTHRITIS IN ADULTS BY GENERAL PRACTITIONERS: A SURVEY IN A FRENCH COHORT

S. Lecauchois[1], S. Gentile[2], P. Champsaur[3], J.-P. Mattei[4], L. Dillinger[5], V. Goeb[6], S. Guis[4,7]. *[1]Aix Marseille Université, AP-HM, Marseille Cedex 9, France; [2]Public Health; [3]Radiology; [4]Rheumatology, Aix Marseille Université, AP-HM, Marseille Cedex 9; [5]General Practitioner, Aix-en-Provence; [6]Rheumatology, CHU Amiens, Université de Picardie Jules Verne, Amiens; [7]Crmbm-Cemerem UMR 7339, CNRS, Aix Marseille Université, Marseille, France*

Background: A guide of good clinical practice regarding *de novo* arthritis in adults has been edited.

Objectives: The aim of this work is to identify whether the diagnostic and therapeutic tools proposed by general practitioners (GPs) to adults with a *de novo* arthritis is in line with the corresponding recommendations.

Methods: A questionnaire regarding the characteristics and the handling of *de novo* arthritis in adults has been submitted to 300 GPs chosen randomly from a French cohort database. The study period was from February 2015 to February 2016. Fifty seven GPs participated in the study (19%).

Results: No particular specificity was identified in the GP group. The age of patients ranged between 40 and 75 yo. The prevalence of arthritis was less than 5% among the GPs patients. The relative number of each category of arthritis was rheumatoid arthritis (29%), spondyloarthritis (14%), PPR (8%), other kinds of microcrystalline arthritis: chondrocalcinosis, (38.4%), gout (11,6%).

Joints with mechanic degenerative effusion related to osteo-arthritis might be misdiagnosed as an inflammatory arthritis.

The knee was the most frequently involved joint in arthritis. The initial paraclinical

survey was related to biology. Most of the patients were treated with NSAI as an initial intent. A corticoids-based therapy was proposed to 1.4% of the patients and the corresponding specialist was a rheumatologist (98%).
Conclusions: The *de novo* arthritis prevalence for GPs is less than 5% with the knee being the most affected joint. Most frequently, GP are faced with gout, rheumatoid arthritis and spondyloarthritis. The handling is in line with the corresponding guide of good clinical practice.

AB1109 DOSE DE-ESCALATION IN A SPECIALIZED OUTPATIENT CLINIC ON BIOLOGICAL THERAPY: COST MINIMIZATION OBSERVATIONAL STUDY

S. Manrique-Arija, I. Ureña, F.G. Jimenez-Nuñez, N. Mena-Vazquez, V. Coret, L. Cano-García, M.C. Ordoñez-Cañizares, C.M. Romero-Barco, M. Rojas-Gimenez, C. Domic, C. Fuego, G. Diaz-Cordoves, A. Belmonte, M.V. Irigoyen, A. Ponce, M. Rodriguez-Perez, A. Fernandez-Nebro. *Department of Reumatology at the University Regional Hospital of Malaga (HRUM). Institute for Biomedical Research in Málaga (IBIMA). Malaga University., Malaga, Spain*

Objectives: To estimate the annual cost in the use of biological therapy (BT) in patients with different rheumatic diseases when dose modifications are undertaken in daily clinical practice in a specialized outpatient clinic during 2016 and to compare the results with data obtained in 2013.
Methods: *Design:* Cost minimization observational study under conditions of clinical practice. *Patients:* Patients with different rheumatic diseases who come to a specialized outpatient clinic on BT in the Rheumatologic department at a tertiary Spanish hospital (with a tight follow-up) that had been treated with BT under reduced doses during 2016 were collected. *Protocol:* Reductions in treatment dose or dose frequency were established empirically and were carried out by their rheumatologist in those patients who were in remission (DAS 28 <2,6) for at least 6 months without steroids. *Main outcome:* Reduction of annual average cost in euros in BT used in patients who are in dose reduction in clinical practice in 2016. Secondary outcome:Differences in annual costs reduction in 2016 compared with 2013. The cost reduction was calculated by comparing the actual expenditure (after modifying treatment dose in clinical practice) with the theoretical costs (official price) in case you had not made the adjustment. *Statistical analysis:* Sample descriptive analysis. Reducing annual absolute costs and by treatment after tapering down doses in clinical practice in 2016 and the differences found between 2013 were calculated.
Results: During 2016, the dose of the BT of 168 patients (94 Subcutaneous BT and 74 intravenous BT) were modified in clinical practice after reaching clinical remission:mean of DAS 28 (mean±SD)=2.31±0.76 or BASDAI (mean±SD)=2.15±1.39 without radiographic progression. Most patients were women (n=113;67%)and had rheumatoid arthritis (n=103;62%) and the rest were distributed among: spondyloarthritis (n=28;17%), psoriatic arthritis (n=22;13%), juvenile idiopathic arthritis (n=10;5%) and Systemic Lupus Erithematosus (n=5;3%). No patients treated with certolizumab or anakinra was modified treatment doses. During this period, 5 patients discontinued BT (3 remissions and 2 minor adverse events). Table 1 shows the number of patients by type of BT and costs. The BT dose reduction in clinical practice during 2016 represented a saving of *676,501.67*€ and a greater efficiency of treatments while in 2013, only 86 patients (30 etanercept, 15 adalimumab, 16 Infliximab (Remicade), 15 Tocilizumab IV and 55 Rituximab) had a modified dose of BT in clinical practice assuming a saving of 396,995.46€. The difference in the annual cost reductions in 2016 compared to 2013 meant a saving of 279.506,21€ more in the last year. Table 1.

Biological Therapy	Patients with reduced doses	Theoretical Annual costs (Label doses)	Real Annual Costs (Clinical practice doses)	Annual costs reduction 2016
Etanercept	53	582,453.04	317,649.69	264,803.35
Adalimumab	28	343,186.48	217,922.02	125,264.46
Golimumab	3	32,297.46	28,898.76	3,398.70
Tocilizumab sc	9	109,755.36	79,137.42	30,617,94
Tocilizumab iv	15	179,821.23	136,803.11	43,018.12
Abatacept	1	16,512.42	17,410.64	898.22
Infliximab (Remicade)	15	164,589.70	119,720.52	44,869.18
Rituximab	44	286,410.96	122,779.26	163,631.7
Total	168	**1,715,026.65**	**1,040,321.42**	**676,501.67**

Conclusions: In rheumatic diseases we may do a dose de-escalation of BT in patients who go into remission and therefore we could reduce the associated costs of BT and being more efficient with the treatments. We believe that it is important to create specialized outpatient clinics on BT where a tight-control management of these patients and an individualized treatment are carried out.

AB1110 WHAT CAN GOOGLE TRENDS CAN TELL US ABOUT A DISEASE? BIG DATA TRENDS ANALYSIS IN SYSTEMIC LUPUS ERYTHEMATOSUS

S. Sciascia, M. Radin. *Department of Clinical and Biological Sciences, Center of Research of Immunopathology and Rare Diseases- Coordinating Center of Piemonte and Valle d'Aosta Network for Rare Diseases, Torino, Italy*

Background: "*Infodemiology*" and "*infoveillance*" are two recent terms created to describe a new developing approach for public health, based on Big Data monitoring and data mining, applicable to provide new insights into unmet needs, such as the epidemiology of an uncommon disease like Systemic Lupus Erythematosus (SLE)[1].
Analysing how people (including patients, researchers, physicians) search and navigate the Internet for health-related information, as well as how they communicate and share this information, can provide valuable insights into health-related behaviour of populations.
Objectives: In this study we aimed to investigate trends of Internet search volumes linked to SLE, on-going clinical trials and research developments associated to the disease, using Big Data monitoring and data mining. We also aimed to analyse peak-related information to investigate knowledge translation of novel therapies for SLE and the influence of media on health-related information seeking.
Methods: We performed a longitudinal analysis based on the large amount of data generated by Google Trends, scientific search tools (SCOPUS, Medline/Pubmed/ClinicalTrails.gov) considering "SLE", and "lupus" in a 5-year web-based research.
Results: We observed an overall higher distribution of search volumes from Google Trends in United States, South America, Canada, South Africa, Australia and Europe (mainly Italy, United Kingdom, Spain, France, Germany), showing a geographically heterogeneity in insight into health-related behaviour of the different populations towards SLE. Data from Medline/Pubmed, SCOPUS and ClinicalTrials.gov were also analysed in order to monitor public health relevant publications and on-going trials. When comparing these results to the distribution of search volumes of Google Trends, we observed an overall similar distribution of Big Data for United States and Europe, while South America, Canada, Australia and South Africa were less represented. We observed a misbalance between search volumes for Google Trends compared to Medline/Pubmed, SCOPUS and ClinicalTrials.gov in some areas, suggesting a recent and expanding interest on SLE-related health issues in some countries.

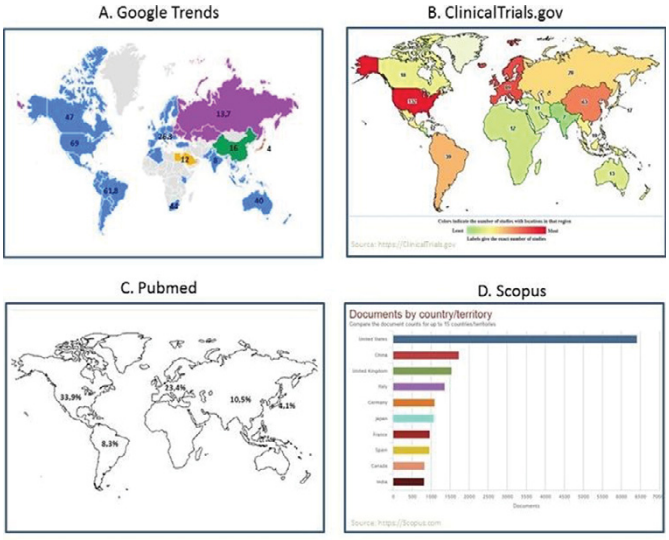

Figure1.: profile plots for relative search volumes. Profile plots show the relative search volumes, from January 2011 to January 2016, for 'Systemic Lupus Erythematosus' using Google Trends (Panel A), ClinicalTrials.gov (Panel B), PubMed (Panel C) and Scopus (Panel D). Date of search 16th October 2016.

Conclusions: We observed in some countries a misbalance between the search volumes generated by Google Trends and those analyzed through scientific search tools. This new approach, merging togheter informatics and epidemiology, is able to investigate health information seeking. In the near future it might give an estimate of the health-related demand and even of the health-related behaviour of patients with SLE.

AB1111 A PROSPECTIVE COHORT STUDY MEASURING COST-BENEFIT ANALYSIS OF THE OTAGO EXERCISE PROGRAMME IN COMMUNITY DWELLING ADULTS WITH RHEUMATOID ARTHRITIS

S. Abdulrazaq[1], T. O'Neill[2], E.K. Stanmore[3], J. Oldham[1], D. Skelton[4], M. Pilling[5], B. Gannon[1], C. Todd[1]. [1]*School of Nursing, Midwifery and Social Work and MAHSC;* [2]*School of Medical Sciences;* [3]*School of Nursing, University of Manchester, Manchester;* [4]*University of Glasgow, Glasgow;* [5]*University of Manchester, Manchester, United Kingdom*

Background: Falls are one of the major health problems in adults with Rheumatoid Arthritis (RA). Interventions, such as the Otago Exercise Programme (OEP), can reduce falls in community dwelling adults by up to 35%. The cost-benefits of such a programme in adults with RA have not been studied
Objectives: To determine healthcare cost of falls in adults with RA, and estimate whether it may be cost efficient to roll out the OEP to improve function and prevent falls in adults living with RA.
Methods: Patients with Rheumatoid Arthritis aged ≥18 years were recruited from four rheumatology clinics across the Northwest of England. Participants were followed up for 1 year with monthly fall calendars, telephone calls and self-report questionnaires. Estimated medical cost of a fall-related injury incurred per-person were calculated and compared with OEP implemention costs to establish potential economic benefits.
Results: 535 patients were recruited and 598 falls were reported by 195 patients. Cumulative medical costs resulting from all injury leading to hospital services is £ 374,354 (US$540,485). Average estimated cost per fall is £ 1120 (US$1617). Estimated cost of implementing the OEP for 535 people is £ 116,479 (US$168,504) or £ 217.72 (US$314.34) per-person. Based on effectiveness of the OEP it can be estimated that out of the 598 falls, 209 falls would be prevented. This suggests that £ 234,583 (US$338,116) savings could be made, a net benefit of £ 118,104 (US$170,623).

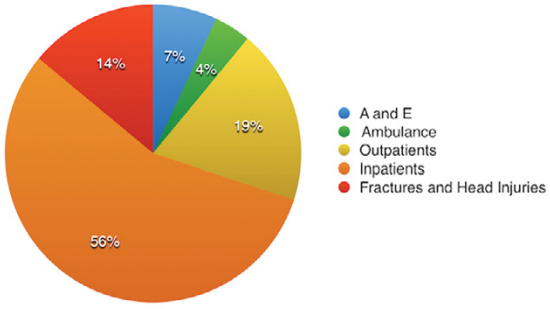

Figure 2. Chart showing spread of cost in health care costs

Conclusions: Implementation of the OEP programme for patients with RA has potentially significant economic benefits and should be considered for patients with the disease.

AB1112 DATANETWORK RHEUMA 4.0 – REAL WORLD DATA FROM PRIVATE PRACTICE

S. Kleinert[1], F. Schuch[1], S. Späthling-Mestekemper[2], M. Feuchtenberger[3], C. Kuhn[4], M. Welcker[5]. [1]*Rheumatologie, Rheumatologische Schwerpunktpraxis, Erlangen;* [2]*Rheumatologie, Rheumapraxis München-Pasing, München;* [3]*Rheumatologie, Schwerpunktpraxis für Rheumatologie, Burghausen;* [4]*Rheumatologie, Internistische Schwerpunktpraxis am Ludwigsplatz, Karlsruhe;* [5]*Rheumatologie, MVZ für Rheumatologie Dr. Martin Welcker, Planegg, Germany*

Background: The datanetwork Rheuma 4.0 (DNR_4.0) is a consortium of 5 internistic-rheumatologic specialized practices. Patient data that were collected routinely will be pooled pseudonymized (e.g. via RheumaDok) and will be made available to answer numerous healthcare- and scientific research questions.
Methods: The participating centres document the following data in specific rheumatologic data documentation systems (RheumaDok, Emil, DocuMed.rh). These data will be routed automatically to the data base of the DNR_4.0 via a prespecified interface and can be used for certain research areas:
Diagnosis (by rheumatologist (R), anamnesis (R), medication (R), morning stiffness (R, patient (P)), scores like RADAI (R, P), DAS28 (R), BASDAI (P), BASFI (P), quality of life (R, P). Also prespecified laboratory measures (R) like ESR, CRP etc. can be collected automatically.
Patient reported Outcomes (PROs) that were entered via mobile applications like RheumaLive and AxSpALive can be collected in certain intervalls and be sent encrypted into the medical office data base.
The data entered by patients will be screened by the rheumatologist or nurse and will be stored in the underlying data base. Clinical data that are collected during regular F2F-appointments will be stored together with the PROs according to a specific period of time.
Results: The datanetwork Rheuma 4.0 (DNR_4.0) is an association of 5 internistic-rheumatologic specialized practices.
By the automated documentation of PROs (patient) and medical measures (rheumatologist) in an underlying data base, scientific and health care real worl data can be collected without extra workload or time requirements. These data are specific and different from data collected by other centres. In principal, the extension of the group to increase the number of participating centres is easily possible because the interface is an "open system". This allows to build an automised collecting, big and representative data base.
Now pooled data sets of 18.000 patients are available in the data base. In a first step, quality and the completeness of the existing data sets will be evaluated and the daily documentation routines will be described. Anonymised statistical analysis of the pooled data sets of the rheumatologic centres will allow to gain knowledge in respect to health care research of the own working group and external interested parties like research groups, sick funds, insurance companies and companies.
Conclusions: The german biologic registry Rabbit and the "Core documentation" data base deliver valid data about the safety and efficacy of rheumatologic medication. The datanetwork Rheuma 4.0 will make a valuable contribution – especially in conjunction with apps of patient's self management like RheumaLive and AxSpALive – to health care research, therapeutic strategies and clinical questions from daily practice.
Acknowledgements: RheumaLive and AxSpALive werde developed by Starhealth GmbH on behalf of UCB Pharma GmbH.

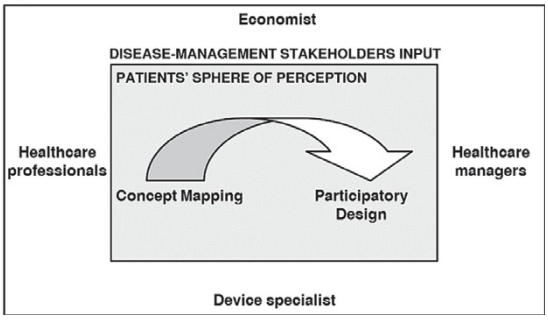
AB1113 PATIENT PARTICIPATION IS CRUCIAL WHEN INTRODUCING NEW DEVICE TECHNOLOGIES IN THE MANAGEMENT OF CHRONIC ARTHRITIS: APPLYING THE PARKER MODEL, A QUALITATIVE 3-STEP APPROACH



T.S. Jørgensen[1], L. Klokker[1], M. Skougaard[1], H. Asmussen[2,3], A. Lee[4], I. Mountian[5], H. Gudbergsen[1], L.E. Kristensen[1]. [1]*The Parker Institute, Copenhagen University Hospital, Bispebjerg and Frederiksberg, Copenhagen;* [2]*Communication IKH, Roskilde University, Roskilde;* [3]*NATiON, Copenhagen;* [4]*University of Southern Denmark, Odense, Denmark;* [5]*UCB Pharma, Brussels, Belgium*

Background: Patients' participation in design, development, and implementation of new device technologies is essential to ensure added value in patients' disease management.
Objectives: To explore the applicability and relevance of ava®, an electromechanical device (e-Device), as an alternative method for subcutaneous administration of certolizumab pegol.
Methods: The Parker Model is an innovative 3-step qualitative research approach, which combined concept mapping (CM), participatory design (PD), and stakeholder evaluation (SE) to evaluate the e-Device (Figure). CM was applied through workshops, with the participation of patients, using a structured group process focusing on relevant themes to identify issues and concerns with the e-Device. Patients used this information in a series of iterative PD sessions; patients participated in 3 interactive sessions to create a personal e-Device prototype in

cooperation with a designer and a medical expert. This was followed by a common group session. Finally, SE was performed based on semi-structured group and individual interviews with patients and disease-management stakeholders.

Results: The study included 9 rheumatoid arthritis (RA) patients, 4 psoriatic arthritis (PsA) patients, 1 ankylosing spondylitis (AS) patient, 2 doctors, 2 nurses, 1 medical secretary, and 4 key public servants involved in the disease management of the selected rheumatic diseases. Saturation was reached after 3 CM patient workshops, generating 121 statements, which were organized by the participants into themes. Through content analysis of the results from the 3 workshops, 4 concepts were generated: technical usability, physical design, concerns, and enthusiasm. These data were used in the iterative PD sessions, resulting in 4 new proposed prototypes. Finally, SE demonstrated that the identified concepts were pivotal for both facilitating and hampering device implementation, thus creating value when introducing the new e-Device.

Figure: The Parker Model

Conclusions: Patient participation in the 3-step qualitative Parker Model identified important aspects to consider when designing and implementing an innovative device for the treatment and management of RA, PsA, and AS. This is the first time a composite, qualitative research model has been applied when introducing a new device to support these disease areas. The responses from patients and disease-management stakeholders indicated that it is key to include patient input in the design and adaptation of devices alongside education and communication with stakeholders. These resources can help ensure added value when developing devices for the management of RA, PsA, and AS using biologic medicines.

AB1114 PATIENT'S SELF-MONITORING OF DISEASE ACTIVITY OF RHEUMATIC DISEASES VIA WEBAPP – STUDY DESIGN, PATIENT'S PERSPECTIVE AND RECRUITMENT IN THE FIRST 11 MONTHS OF THE SWISS MULTICENTRE, LONGITUDINAL COMPASS II STUDY

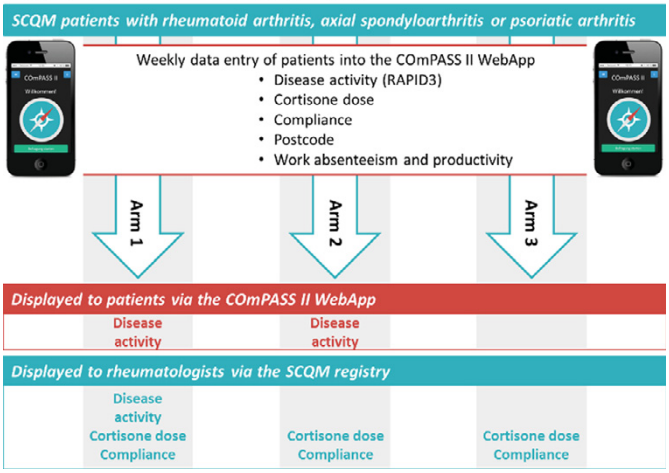
V.K. Jaeger[1], P. Schiffer[2], P. Zufferey[3], L. Pichler[1], A. Badaracco[4], M. Walder[5], J. Dudler[6], D. Frey[7], F. Müller[1], U.A. Walker[1]. *[1]University Hospital Basel, Basel; [2]Praxis beim Rathaus, Zofingen; [3]Lausanne University Hospital, Lausanne; [4]Studio Medico Badaracco Cattaneo, Lugano; [5]Praxis Walder, Dübendorf; [6]Hôpital Cantonal Fribourg, Fribourg; [7]Praxis Frey, Basel, Switzerland*

Background: The management of patients with rheumatic diseases is guided in part by asking patients about their medical history at each clinic visit. Patients often find it difficult to accurately remember the course of their symptoms between these appointments as they are often months apart. Regular app-based patients' self-monitoring of disease activity (with our without feedback to the rheumatologist) between clinic visits might provide a possible solution for this.

The COmPASS I study [1] demonstrated that RA patients' self-assessments of disease activity via App correlate strongly with rheumatologists' assessments. Following up on this, the Swiss based COmPASS II study is embedded in the Swiss rheumatology registry (SCQM) and hence allows the linkage of data obtained via the COmPASS II App from the patients with routine clinical data collected in the registry.

The main aims of the COmPASS II study are to assess if continuous self-monitoring of the disease by patients optimises disease management and outcome in rheumatic diseases, and to assess the fluctuation of disease activity between clinic visits.

Objectives: The objectives of this abstract are to describe the set-up and the recruitment of the COmPASS II study in the first 11 months.



Methods: The COmPASS II App questionnaire consists of the RAPID3 score, a validated, commonly used PRO to self-assess disease activity. Additionally, patients are asked about their therapy compliance and cortisone dose.

At inclusion, interested patients with RA, axSpA and PsA are electronically randomized into 3 study arms (Figure 1). In arm 1 patients and rheumatologist are displayed the self-assessed disease activity over time, the patient directly via the App and the rheumatologist via the SCQM registry. In arm 2 only the patients are displayed their disease activity chart and in study arm 3 neither sees the recorded data. Patients are encouraged to fill in the App weekly.

Results: The COmPASS II App went online on the 15/02/2016. In the first 11 months of COmPASS II, 272 patients were enrolled by their rheumatologist. 64% of patients used the WebApp (32% in arm 1, 38% in arm 2 and 30% in arm 3); 82% of patients filled in the questionnaires for longer than a months, the longest follow-up was 11 months. On average patients use the App every 2 weeks.

Patients found the App easy to use "The COmPASS II WebApp is so easy to use. It doesn't even take me 2 min." and received feedback included "Now my rheumatologist sees how I was since the last appointment instead of me trying to remember how I was half a year ago.".

Figure 1. Design of the COmPASS II study.

Conclusions: The COmPASS II study will validate the utility of app-based patients' self-assessments in enhancing disease control in a treat to target approach and deliver numerous additional scientific data.

AB1115 THE FEASIBILITY OF UTILIZATION OF MOBILE DEVICES TO ENHANCE PATIENT REPORTED OUTCOMES MEASURES (PROMS) IN RHEUMATOLOGY PRACTICE

V. Ognenovski[1,2], K. Burger[3], K. Weiss[4], L. Esser[4], D. Khanna[1]. *[1]Division of Rheumatology, University of Michigan, Ann Arbor, United States; [2]Rheumatology Clinic, Ss Cyril and Methodius Faculty of Medicine, Skopje, Macedonia, The Former Yugoslav Republic Of; [3]Information Technology; [4]University of Michigan, Ann Arbor, United States*

Background: Patient reported outcome measures (PROMs) are accepted modalities of gathering patient-reported health status such as physical, mental and social well-being. In addition to research applications, in some countries such as the United States, some of these measures are being considered as metrics for quality of care. The advent and wide spread use of the electronic medical record (EMR) in the United States has enabled providers (and patients) to collect PROMs electronically via patient portals (1).

At the University of Michigan, the patient medical record is maintained by MiChart- an EPIC®software which interfaces with the Patient Reported Outcomes Measures System –PROMIS (2)- an NIH funded project for development of assessment tools for collecting and analyzing patient health status. Our initial effort focused on integrating the PROMIS questionnaires into the patient EMR for two domains: Adult Physical Function and Pain Intensity Scores into patient portals (electronic patient-physician communication tool), thus enabling patient to complete questionnaires from home computers. Our collection rate of completed PROMs questionnaires via patient portals was about 5–10%.

Objectives: The aim of our project was to examine/enhance collection rate of PROMs with the utilization of portable devices /tablet based PROMs at the time of check-in the clinic by the patient.

Methods: PROMs data was collected from all patients visiting one of the outpatient rheumatology clinics at the University of Michigan from July 1,2016 – Jan 31, 2017. An Android based tablet using Welcome ® software was handed to every patient with instructions to complete a questionnaire on Adult Physical Function and Pain Intensity Score – PROMIS based questionnaires on patient-reported outcome measures. The results were stored in the patients EMR.
Results: Between July 1st 2016 and Jan 31st, 2017, we collected PROMs on patients via patient portals (home computers) and in office mobile devices-tablets. Assisted completion was done by clinic staff on a clinic desk top computer. Total of 2059 out of 2554 patients invited to participate completed the PROMs questionnaires. Of those patients that answered the questionnaires, 82% were done on a mobile device, 10% of patients used the home portal, 8% of patients needed in office assistance. 20% of patients did not answer the questionnaires.

Mode for completion of PROMs	Number of patients
Mobile Device	1694
Portal Home PC	211
Assisted in clinic	154
Total questionnaires completed	2059

Conclusions: Mobile devices are being increaseinlgy used by the patients in the United States for capture of PROMs. Mobile devices increased the PROMs collection rate from approximately 10% to 80% when combining both home portal (home PC) and an office based mobile device (Tablet). Mobile devices alone accounted for >80% of the collection rate of PROMs. In an era of changing information technology, the utilization of mobile devices for PROMs should be explored as a preferred modality.

Epidemiology, risk factors for disease or disease progression

AB1116 PREVALENCE OF POLIAUTOIMMUNITY AND FAMILY AUTOIMMUNITY IN MEXICO

A. Arellano-Martinez, V. Gonzalez-Diaz, S. Cerpa-Cruz, S. Gutierrez-Ureña, J. Reyes-Rueda, K. Garcia-Osuna, G.E. Martinez-Bonilla. *Rheumatology Service, Hospital Civil Fray Antonio Alcalde, Guadalajara, Mexico*

Background: Autoimmune diseases share pathophysiological mechanisms, genetic factors and certain environmental triggers. Its frequency is reported up to 43% for poliautoimmunity and almost half of these have family autoimmunity, but this is unknown in our population.
Objectives: To identify the prevalence of poliautoimmunity and family autoimmunity in a Rheumatology Service of a third level hospital in Mexico.
Methods: Observational, descriptive, cross-sectional study. Consecutive outpatients who attended the Rheumatology Service of the Hospital Civil de Guadalajara "Fray Antonio Alcalde" during 2 months were applied a questionnaire to obtain demographic data, autoimmunity and risk factors. Descriptive statistical analysis was done.
Results: Of 1,208 patients, 484 (40%) had autoimmunity, of these 58 (12%) had polyautoimmunity and 6 (1%) with Multiple Autoimmune Syndrome (MAS). The most frequent of 35 autoimmune diseases registered were: RA 42%; SLE 17%; AS 6%; SSc 5%; SSj 4%; PsA 3%; JIA 3%; autoimmune hypothyroidism 3%; APS 2%; Dermatomyositis 2% and Psoriasis 1%. In the group with polyautoimmunity SLE was present in 26 (45%) patients, SSj in 13 (22%) and autoimmune thyroid disease in 14 (24%). In the MAS group autoimmune thyroid disease in 5 patients. Patients with polyautoimmunity developed first: SLE (14%) and RA (14%). In the patient with MAS autoimmune thyroid disease in 33%. Of the 58 patients with poliautoimmunity 31 (53%) have familial autoimmunity, of which SLE is the most frequent in (22%), followed by autoimmune thyroid disease (17%) and RA (16%). All 6 MAS patients had familial autoimmunity. Referent to risk factores: 154/484 reported active smoking. Of the 58 patients with poliautoimmunity, only 23 (40%) had or are current smokers. Of the 6 patients with MAS 50% presented this risk factor.158/484 (33%) patients had periodontal disease. In patients with autoimmune disease 54% were overweight (28%) or obese (26%). Of the 58 patients with poliautoimmunity 48% were overweight and 21% obese; of patients with MAS 50% were overweight or obese. Only one patient had ASIA syndrome with GCA diagnosed.
Conclusions: The search of polyautoimmunity is required in all patients with autoimmune disease and convenient to consider that these patients will have a higher frequency for familial autoimmunity. Smoking and periodontal disease are widely known risk factors that are no taken serious by patients.

AB1117 LATENT TUBERCULOSIS INFECTION AND TUBERCULOSIS IN PATIENTS WITH RHEUMATIC DISEASES UNDER TREATMENT WITH ANTI-TUMOR NECROSIS FACTOR DRUGS

A.L.B. Morsch [1], G. Garziera [2], F. Otesbelgue [3], F.L. Staub [3], P.E. Palominos [1], C.V. Brenol [1,3], D.R. Silva [2,3,4]. *[1] Serviço de Reumatologia; [2] Programa de Pós-Graduação em Ciências Pneumológicas, Hospital de Clínicas de Porto Alegre; [3] Faculdade de Medicina, Universidade Federal do Rio Grande do Sul; [4] Serviço de Pneumologia, Hospital de Clínicas de Porto Alegre, Porto Alegre, Brazil*

Background: The introduction of biological agents, especially the tumor necrosis factor inhibitors (anti-TNF) for the treatment of rheumatic diseases increased the risk of developing tuberculosis (TB). Screening for latent TB infection (LTBI) is strongly recommended before starting therapy with anti-TNF agents.
Objectives: This study aimed to identify the prevalence of LTBI and TB among patients with rheumatic diseases on anti-TNF drugs.
Methods: In a cross-sectional study, the electronic medical records of all adult patients (≥18 years old) undergoing anti-TNF treatment at Hospital de Clínicas de Porto Alegre, Porto Alegre, Brazil, were reviewed. Every patient underwent Tuberculin Skin Test (TST) before starting anti-TNF treatment.
Results: In total, 176 patients were included. The mean age was 51.9±12.4 years, 34.7% were males, and 90.9% were white. The underlying diseases were rheumatoid arthritis (RA) in 50.6% (N=89), ankylosing spondylitis (AS) in 27.8% (N=49) and psoriatic arthritis (PsA) in 17.6% (N=31). Anti-TNF agents started after TST were: infliximab (22.7%, N=40), adalimumab (48.9%, N=86), etanercept (27.3%, N=48), and golimumab (1.1%, N=2). The prevalence of positive TST was 29.5%. Household contact with TB was significantly associated with a positive TST (p=0.020). RA patients had lower TST reactions than AS patients (p=0.022). There were six cases of TB (3.4%) diagnosed during anti-TNF therapy.
Conclusions: We demonstrated a high prevalence of positive TST (29.5%) among patients with rheumatic diseases in a region with high TB prevalence. Our data corroborates the ACR's recommendation that patients who live in high TB incidence settings should be tested annually for LTBI.

AB1118 REVIEW OF METHODS FOR ASSESSING THE RELATIONSHIP BETWEEN WEATHER AND CHRONIC MUSCULOSKELETAL PAIN

A. Beukenhorst [1], J. McBeth [1], D. Schultz [2], J. Sergeant [1,3], W.G. Dixon [1]. *[1] Arthritis Research UK Centre for Epidemiology, Centre for Musculoskeletal Research; [2] Centre for Atmospheric Science, School of Earth and Environmental Scie nces, University of Manchester; [3] NIHR Manchester Musculoskeletal Biomedical Research Unit, Central Manchester University Hospitals NHS Foundation Trust, Manchester, United Kingdom*

Background: People with chronic pain commonly believe that their pain is affected by the weather. Despite a century's worth of research, there is no scientific consensus on the existence of a relationship between weather and chronic pain.
Objectives: A systematic literature review to (1) gain an overview of existing research on the weather-pain relationship, and (2) summarise the methodologies, methodological rigour and risk of bias in published studies of patients with musculoskeletal conditions.

Methods: Systematic search strategies were developed for 5 databases (Medline, Embase, PsycInfo, Scopus, Web of Science) to retrieve studies that investigated the relationship between weather conditions and chronic pain. Original articles describing observational studies that related chronic pain (primary outcome) to weather conditions (exposure), were included. Study characteristics, methodology (e.g. measurements of pain and weather, aspects of statistical analysis) and data on risk of bias (validation of participants' exposure and diagnosis, coverage of weather variation, correction for confounders) was extracted. Methodological rigour was summarised by mapping the methodological variability among studies and ranking these from least to most rigorous.
Results: The searches returned 16,081 articles. After removing 3090 duplicates and excluding 12726 articles during title screening, 265 abstracts were assessed for eligibility. Of 64 observational studies that met the inclusion criteria, 30 (47%) investigated pain associated with musculoskeletal conditions, 24 (38%) investigated headache and 10 (16%) investigated pain associated with other conditions such as sickle cell disease and dental pain. After full text assessment, 10 of 30 papers on musculoskeletal conditions were excluded because they investigated risk of acute pain episodes rather than chronic pain symptoms (n=6), or investigated multiple conditions (n=4). The 20 included studies investigated rheumatoid arthritis (6, 30%), osteoarthritis (6, 30%), fibromyalgia (6, 30%) and low back pain (2, 10%). A total of 15 studies (75%) reported some effect of weather on chronic pain, and this was clinically significant (consistent and sufficient size of effect) in 6. Participant numbers varied from 19 to 2491. 1 study was cross-sectional and 19 longitudinal with follow ups ranging from two weeks to 3.5 years, with participants scoring their pain once to daily for 12 months. Pain was measured with a Visual Analog Scale or Numeric Rating Scale in 17 (85%). Weather conditions were retrieved from local weather stations, with most studies assuming that participants stayed in the area/city (65%) or postcode area (20%) where they lived.
In 12 (60%) studies, participants were blinded to the study hypothesis. Methods for correcting for confounders were highly variable, with 7 studies not addressing any, and the remainder addressing one or more of 32 confounding variables.
Conclusions: Methodological variability of studies investigating the relationship between weather and chronic musculoskeletal pain is high. This methodological review will inform best research practice for those investigating the relationship between the weather and chronic pain.

AB1119 A DESCRIPTIVE STUDY OF GOUT PATIENTS IN A MULTI-ETHNIC SOCIETY

C. Chua[1], P. Cheung[2], A. Santosa[2], A. Lim[2], G.G. Teng[2]. *[1]Internal Medicine Residency; [2]Division of Rheumatology, University Medicine Cluster, National University Health System, Singapore, Singapore*

Background: Gout is a common inflammatory arthritis with rising global prevalence and health burden, especially in the Asia-pacific regions. Ethnicity may play a significant role suggesting lifestyle and/or genetic predisposition, but studies in Asia are limited[1,2].
Objectives: Our study sought to assess the demographic and clinical factors of gout in the multi-ethnic Singapore and describe the burden and treatment pattern in our patients.
Methods: 282 adults with rheumatologist-diagnosed gout were recruited from rheumatology clinics of an academic medical centre in Singapore. Data on demographic and lifestyle features, medical conditions, gout severity and treatment were obtained.
Results: 282 subjects were recruited and 92.6% were men. There were 77% Chinese, 18.8% Malays and 2.5% Indians, compared to Singapore's population makeup (74%, 13% and 9% respectively). Mean age at recruitment was 52.6 years (SD 16.1) while age at gout onset was 42.5 years (SD 16.7). 34.4% received primary or no education; 67.0% were employed and 20.7% retired. 22.7% were current alcohol drinkers while 50.7% were teetotalers. 23.4% were current smokers. Mean body mass index (BMI) was 28.1kg/m^2 (SD 6.0), 26.6% had BMI $\geq$30kg/m^2 while 69.9% had BMI $\geq$25kg/m^2. Prevalence of hypertension was 56.7%, diabetes mellitus 18.8%, dyslipidemia 48.2% and chronic kidney disease (CKD, defined as glomerular filtration rate $<$60ml/min/1.73m^2) 32.4%. Malays had significantly less alcohol intake (1.9%) but higher proportions of diabetes (32.1%), CKD (50.9%) and obesity (54.7%), compared with Chinese subjects (26.3%, 16.1%, 28.6% and 19.8% respectively, all Ps $<$0.05). Gout severity was rated moderate by 30.9% and severe in 50.4%; 69.3% suffered $\geq$3 attacks in 6 months. Mean SU was 477.8μmol/L (SD 130.8). 80.1% were on allopurinol. Subjects (22.3%) who achieved serum urate (SU) $\leq$360μmol/L, when compared to those with SU $>$360μmol/L, were more likely to be on urate lowering therapy (82.5% vs 60.7%, P=0.001), on higher mean allopurinol dose [337 mg/d (SD 166) vs 233 mg/d (SD 140), P$<$0.001] and statin (54.8% vs 33.3%, P=0.003). There were no significant differences amongst ethnicities for SU levels, gout severity and number of attacks.
Conclusions: Gout has substantial health burden in Singapore. Hypertension, dyslipidemia and obesity are more prevalent in our gout subjects compared to our population. Despite notably less alcohol intake compared with other cohorts[3–5], Singapore Malays seemed to suffer higher prevalence and comorbidities of gout. Majority of patients had moderate to severe disease but less than 25% achieved target SU levels highlighting suboptimal management of gout locally.

AB1120 COMPARISON OF NON-RADIOGRAPHIC SPONDYLOARTHRITIS VERSUS ANKYLOSING SPONDYLITIS PATIENTS UNDERGOING BIOLOGICAL THERAPY

C. Cobilinschi, D. Opris-Belinski, R. Ionescu. *Sfanta Maria Clinical Hospital, Bucharest, Romania*

Background: Axial spondyloarthritis include non-radiographic spondyloarthritis (nr-SpA) and ankylosing spondylitis (AS); they reveal the extent of sacroiliitis assessed by conventional x-ray or MRI (1). The natural history of nr-SpA follows various evolution patterns; smoking, male gender, high levels of inflammatory markers or initial radiographic lesions are among predictor factors of progression to AS (2).
Objectives: The objective of the present study was to compare features related to progression of nr-SpA patients versus AS patients undergoing biological therapy with an anti-TNF agent.
Methods: This was an observational, cross-sectional study including 94 patients with nr-SpA and AS under continuous anti-TNF therapy for at least six months. SPSS 20.0 was used to analyze data with a P value of 0.05.
Results: Out of the selected study group, 69 patients were diagnosed with AS having a mean age of 44.8±10.8, while 25 patients had nr-SpA. Patients with nr-SpA were aged 32.1±6.6 years old and 40% of them were women, a rate significantly than in the AS group (P=0.05). Mean age at disease onset was 30.7 years for the AS subgroup versus only 23.8 years for patients with nr-SpA (P$<$0.001). AS patients presented a significantly higher value of the BMI compared to nr-SpA (27 versus 24.7 kg/m^{2,} P$<$0.001). 91% of patients had positive HLA B27 and 7.4% had a positive family history of SpA, with no significant differences between the two subgroups. A higher level of CRP was noticed in AS patients (P=0.038).In the study cohort the time interval from symptom onset to establishing a diagnosis was of 39.9±55.6 months, with a mean delay interval of 2.32 years for patients with nr-SpA and higher, of 3.5 for patients with AS (P=0.01).
Conclusions: The nr-SpA group had a considerably higher percentage of females compared to the AS subgroup. AS patients presented higher values of CRP at follow-up visits as opposed to nr-SpA patients. There were no significant differences between nr-SpA and AS patients regarding BASDAI or PtGA scores, smoking status or frequency of uveitis. The presence of HLA B27 did not differ between the two subgroups, thus it might not be a reliable predictive factor of progression.

AB1121 TRABECULAR BONE SCORE COMBINED WITH CLINICAL RISK FACTORS CAN PREDICT INCIDENT FRACTURE IN RHEUMATOID ARTHRITIS PATIENTS

D. Kim[1], S.-K. Cho[1], H.-R. Park[1], Y.Y. Choi[2], Y.-K. Sung[1]. *[1]Rheumatology, Hanyang University Hospital for Rheumatic Diseases; [2]Nuclear medicine, Hanyang University Hospital, Seoul, Korea, Republic Of*

Background: Fracture is one of the most common and important comorbidities in rheumatoid arthritis (RA) patients, especially patients who use glucocorticoids (GC). However, bone mineral density (BMD) by dual-energy x-ray absorptiometry (DXA) which is the gold standard of diagnosing and monitoring osteoporosis is not a useful tool for predicting new fracture in RA patients. Previous studies suggested the possibility of trabecular bone score (TBS) as a useful predictor for incident fracture.
Objectives: We aimed to evaluate the accuracy of TBS combined with clinical risk factors or BMD for prediction of new fracture in patients with RA.
Methods: A total of 100 female RA patients were enrolled with assessment of TBS, BMD, and clinical risk factors for fracture. During follow-up period, we

calculated the incident rate of all fractures. After dividing the patients according to the use of GCs, we compared baseline characteristics and fracture-free survival between two groups. We compared accuracies of TBS, BMD, clinical risk factors for fracture and their combinations for predicting new fractures using areas under the receiver operator characteristic (ROC) curve (AUC).

Results: A total of 14 fractures in 12 patients were occurred among 100 patients during follow-up (428.8 person-years): 9 among the 44 in GC users and 5 in 56 GC non-users. Incidence of fracture was not different between two groups (log-rank test, p=0.27). AUC for incident fracture prediction of TBS alone [AUC 0.54, 95% confidence interval (CI) 0.35–0.72] was comparable with TBS combined with L-spine BMD (AUC 0.54, 95% CI 0.36–0.71) or with hip BMD (AUC 0.55, 95% CI 0.37–0.73). Accuracy for prediction of new fracture is increased when TBS was combined with age and history of previous fracture (AUC 0.74, 95% CI 0.62–0.85). In GC users, history of previous fracture alone (AUC 0.79, 95% CI 0.62–0.97) showed the best accuracy for predicting new fracture among TBS, BMD, clinical risk factors for fracture and their combinations.

Conclusions: TBS combined with age and previous history of fracture showed the highest accuracy for predicting new fracture compared to TBS or BMD alone or their combinations in RA patients. In GC users, history of previous fracture alone showed the highest accuracy for predicting new fracture.

AB1122 ALL-CAUSE OF HOSPITAL MORTALITY IN PATIENTS WITH RHEUMATOID ARTHRITIS AND LUPUS ERYTHEMATOSUS IN A UNIVERSITY HOSPITAL DURING 1998 TO 2014

D. Vega-Morales, J.A. Esquivel Valerio, A.C. Arana-Guajardo. *Rheumatology Service, Hospital Universitario Dr. José Eleuterio González, Monterrey, Mexico*

Background: All-cause and cause-specific mortality is increased in patients with systemic lupus erythematosus (SLE) and Rheumatoid Arthritis (RA) when compared to the general population. Mortality can be attributed to the disease per se, side effects of drugs and effect of comorbidities. The survival of patients has improved over the past years when compared to historical controls

Objectives: The objective is to describe all-case of mortality in patients with SLE and RA in a university hospital.

Methods: This is an observational, descriptive, and cross-sectional study. We included all patients with SLE and RA hospitalized during 1998 to 2014. The cause of death was obtained from medical records and classified according to International Classification of Diseases (ICD)-10. We made a descriptive analysis of all-cause of mortality of both diseases.

Results: We analyzed 1,330 medical records, of which 215 died in hospital. The respiratory insufficiency was the most common mortality diagnosis in both diseases (RA 29%, SLE 24.1%), followed by sepsis (RA 25%, SLE 20.4%). The all-cause of mortality of SLE and RA are shown in Table 1. Of the 467 RA hospital admissions, the 5.1% died, and of the 863 SLE hospital admissions, the 22.1% died.

Table 1. Mortality of RA and SLE

Year	RA		SLE	
	Hospital admissions, n=467	Deaths, n=24	Hospital admissions, n=863	Deaths, n=191
1998–99	18 (3.9)	3 (25)	57 (6.6)	12 (47.4)
2000	22 (4.7)	0 (0)	21 (2.4)	4 (19)
2001	14 (3)	0 (0)	36 (4.2)	5 (13.9)
2002	17 (3.6)	0 (0)	22 (2.5)	2 (9.1)
2003	26 (5.6)	0 (0)	65 (7.5)	22 (33.8)
2004	33 (7.1)	1 (3.03)	40 (4.6)	9 (22.5)
2005	28 (6)	1 (3.57)	64 (7.4)	32 (50)
2006	27 (5.8)	0 (0)	39 (4.5)	7 (17.9)
2007	34 (7.3)	0 (0)	33 (3.8)	9 (27.3)
2008	40 (8.6)	2 (5)	49 (5.6)	19 (38.8)
2009	28 (6)	0 (0)	53 (6.1)	8 (15.1)
2010	24 (5.1)	7 (29.17)	60 (7)	10 (16.7)
2011	27 (5.8)	0 (0)	51 (5.9)	9 (17.6)
2012	31 (6.6)	2 (6.45)	80 (9.3)	9 (11.3)
2013	41 (8.8)	6 (14.63)	88 (10.2)	15 (17)
2014	40 (8.6)	2 (5)	66 (7.6)	16 (24.2)
2015	17 (3.6)	0 (0)	39 (4.5)	3 (7.7)

RA: Rheumatoid arthritis, SLE: Systemic Lupus Erythematosus.

Conclusions: Advances in the diagnosis and treatment of SLE and RA, have decreased the morbidity and mortality of the two diseases. Infectious and cardiovascular pathologies were the most frequent causes of death.

AB1123 POOR ASSESSMENT OF RISK OF OSTEOPOROSIS AFTER A FOREARM FRACTURE IN WOMEN: A HEALTH INSURANCE DATABASE STUDY IN THE LOIRE VALLEY REGION (FRANCE)

E. Cattelain-Lopez[1,2], D. Chu Miow Lin[1], P. Goupille[1,2], A. Happe[3], E. Lespessailles[4], F. Jacquot[2], P. Tauveron[2], E. Rusch[5,6], E. Oger[3], D. Mulleman[1,2]. *[1]Rheumatology, Université François Rabelais de Tours; [2]Rheumatology, CHRU de Tours, Tours; [3]Pharmaco-epidemiology, Université de Rennes 1, Rennes; [4]Rheumatology, CHR d'Orléans, Orléans; [5]Health Economy, Université François Rabelais de Tours; [6]Health Economy, CHRU de Tours, Tours, France*

Background: Bone Mineral density (BMD) assessment is a useful tool to evaluate bone fragility and is largely recommended in patients at risk of osteoporosis. We have previously reported in 250 women aged 50 year-old or more that only ≈10% of them had a BMD after a forearm fracture (1).

Objectives: Herein, we evaluated BMD assessment and prescription of anti-osteoporotic drugs after a forearm fracture in women after 50 year-old in a large population database.

Methods: We identified all forearm fractures in women aged 50 years old or more in the "Centre-Val de Loire, France" area between 01/01/2011 and 31/12/2012, using the National Health Insurance database which cover both private and public sectors of the whole population. We analyzed the reimbursement and determinants of BMD assessment such as age, consumption of drugs inducing osteoporosis, anti-osteoporotics drugs and long term illnesses.

Results: We identified 4120 women with a forearm fracture during the study period. Among them, 546 (13.25%) had a BMD assessment performed at a median time of 4 months after the fracture. Women who had had a BMD were significantly yonger than those who had not (67.44 years versus 74.63 years: OR=0.941 CI95% (0.932–0.949)). Anti-aromatase treatment was positively associated with BMD assessment (OR=3.233 (CI95%: 1.976–5.290)) while corticosteroid were not (OR=0.866 (CI95%: 0.601–1.247)). Among the women who had a BMD assessment, 168/546 (30.77%) had an anti-osteoporotic drug initiated after the forearm fracture, versus 231/3574 (6.46%) in those who had no BMD performed ($p<0.05$).

Conclusions: In this large population, less than 15 percent of women over 50 year-old have a BMD assessment after a forearm fracture. BMD assessment was associated with anti-osteoporotic drugs initiation.

AB1124 EFFECT OF SARCOPENIA, SUBCUTANEOUS ADIPOSE TISSUE AND ABDOMINAL VISCERAL FAT ON MORTALITY RISK OF COMMUNITY-DWELLING OLDER ADULTS: A POPULATION-BASED PROSPECTIVE COHORT STUDY IN BRAZIL

F.M. Santana, D. Domiciano, M. Gonçalves, L.G. Machado, C.P. Figueiredo, J.B. Lopes, V. Caparbo, L. Takayama, R.M.R. Pereira. *Department of Rheumatology, University of São Paulo, São Paulo, Brazil*

Background: Body composition changes resulting from ageing (decreased muscle mass and increased fat tissue) are frequently not accompanied by concomitant changes in body mass index (BMI). Thus, BMI has low accuracy to estimate death risk attributed to changes in body composition in the older adults[1]. Currently, the best method for body composition analysis in routine clinical practice is dual energy X-ray absorptiometry (DXA)[2]. However, the few studies on body composition by DXA and mortality risk in elderly have some limitations, such as analysis not compartmentalized (subcutaneous and visceral tissues) of body fat and appendicular muscle mass not adjusted for fat mass[3].

Objectives: We sought to investigate the association between body composition by DXA (including visceral fat measurement) and mortality in a longitudinal, prospective, population-based cohort of elderly subjects.

Methods: 839 community-dwelling subjects (516 women, 323 men), ≥65 years, were assessed by questionnaire on clinical data, laboratory exams and body composition by DXA using Hologic QDR 4500A equipment. DXA APEX software computes visceral adipose tissue (VAT) by subtracting the subcutaneous adipose tissue (SAT) from the total android fat. All analyses were performed at baseline. Total body fat was expressed by fat mass index (FMI) [(total body fat (kg)/height^2 (m)]. Sarcopenia was defined as low appendicular muscle mass adjusted for fat. Mortality was recorded during 4 year-follow-up. Multivariate logistic regression was used to compute odds ratios for all-cause and cardiovascular mortality.

Results: Over a mean 4.06±1.07 years of follow-up, there were 132 (15.7%) deaths. In men, after adjustment for age, BMI, smoking, physical activity, alcohol, diabetes, dyslipidemia, cardiovascular event, recurrent falls, 25OHD and PTH, the presence of sarcopenia (OR 11.36, 95% CI: 2.21–58.37, p=0.004) and visceral fat mass (OR 1.99 95% CI: 1.38–2.87, p<0.001, for each 100g-increase) significantly increased all-cause mortality risk, while FMI was associated with decreased mortality risk (OR 0.48, 95% CI: 0.33–0.71, p<0.001). Similar results were observed for cardiovascular mortality in men: sarcopenia (OR 14.84, 95% CI: 5.15–47.72, p<0.001), visceral fat mass (OR 1.66, 95% CI: 1.31–2.10, p<0.001) and FMI (OR 0.57,95% CI: 0.43–0.76, p<0.001). In women, only sarcopenia was predictor of all-cause (OR 62.88, 95% CI: 22.59–175.0, p<0.001) and cardiovascular death (OR 74.54, 95% CI: 9.72–571.46, p<0.001).
Conclusions: Sarcopenia and fat distribution are associated with all cause and cardiovascular mortality risk in elderly, and they are different according to sex. Visceral fat and subcutaneous fat have opposite roles on mortality risk in elderly men, and this is distinct from what is observed in young adults.These findings point to the risk of encouraging weight loss in the elderly aiming young adult goals. Furthermore, DXA seems to be a promising tool for evaluation risk of mortality in elderly, since it is easily applicable in clinical practice.

AB1125 PREDICTION OF CHRONIC DAMAGE IN SYSTEMIC LUPUS ERYTHEMATOSUS BY USING MACHINE-LEARNING MODELS

F. Ceccarelli[1], M. Sciandrone[2], C. Perricone[1], G. Galvan[2], F. Morelli[2], L.N. Vicente[3], I. Leccese[1], L. Massaro[1], E. Cipriano[1], F.R. Spinelli[1], C. Alessandri[1], G. Valesini[1], F. Conti[1]. *[1]Lupus Clinic, Reumatologia, Dipartimento di Medicina Interna e Specialità Mediche, Sapienza Università di Roma, Roma; [2]Dipartimento di Ingegneria dell'Informazione, Università di Firenze, Firenze, Italy; [3]Departemento de Matematica, Universidade de Coimbra, Coimbra, Portugal*

Background: The increased survival in Systemic Lupus Erythematosus (SLE) patients implies the development of chronic damage, occurring in up to 50% of cases after a follow-up of 10 years. Its prevention is a major goal in the SLE management. During the last years, it has been suggested that Artificial Neural Networks (ANNs) could be a useful prediction tool in medical *scenarios*, by using patients' data as inputs and the specific outcomes as outputs. The International Conference on Advanced Computing and Communication Systems in 2015 underlined the possible application of sophisticated data analysis tools, such as machine learning methods, in SLE patients, in the light of their potential application to diagnostic and prediction purposes.
Objectives: In the present study, we aimed at predicting chronic damage in a large monocentric SLE cohort by using neural networks.
Methods: For the present analysis, we used data from 413 SLE patients (1997 ACR criteria; M/F 30/383; mean age ± SD 46.3±11.9 years; mean disease duration ± SD 174.6±112.1 months, mean follow-up period ±SD 63.9±30.7 months). At each visit, the patients underwent a complete physical examination and clinical and laboratory data were collected in a standardized, computerized, and electronically filled form. All the patients were evaluated at least twice per year. Autoantibodies and complement serum levels were also registered. Chronic damage was assessed by the SLICC/ACR Damage Index (SDI). We applied Recurrent Neural Networks (RNNs) as a machine-learning model to predict the risk of chronic damage. The clinical data sequences registered for each patient during the follow-up were used for building and testing the RNNs. We used 27 clinical and laboratory items for the mathematical model.
Results: At the first visit, 35.8% of patients had an SDI≥1, with a mean±SD value of 1.7±1.1. For the RNN model, two groups of patients were analyzed: patients with SDI=0 at the baseline, developing damage during the follow-up (N=38), and patients without damage (SDI=0). In particular, in the first group, we used all the visits before the development of damage, and in the second group, we considered patients with at least 5 visits and a follow-up of 2 years. We created a mathematical model with an AUC value of 0.77, able to predict damage development. A threshold value of 0.35 (sensitivity 0.74, specificity 0.76) seems able to identify patients at risk to develop damage.
Conclusions: We applied RNNs to identify a prediction model for SLE chronic damage. By using longitudinal data, including laboratory and clinical items, we created a mathematical model able to identify patients at higher risk to develop chronic damage.

AB1126 CITRULLINATION OF PROTEINS, SMOKING AND RHEUMATOID ARTHRITIS

G. Belakova[1], V. Manka[1], P. Racay[2], E. Zanova[3]. *[1]MEDMAN s.r.o; [2]Biochemistry Department/Commenius University, Martin; [3]Department of Rheumatology, Piestany, Slovakia*

Background: Rheumatoid arthritis (RA) is an inflammatory disease characterized by chronic synovitis and erosive destruction of articular cartilage and bone ultimately leading to joint deformities, disability, loss of quality of life and work loss. There are multiple risk factors, both environmental and genetic, that may predispose an individual to developing RA. Cigarette smoking is the most important risk factor. Citrulline contained within proteins is created post-translationally by the action of the enzyme peptidyl arginine deiminase on the aminoacid arginine. Citrullination takes place in several normal cellular processes, including inflammation, apoptosis, and cellular differentiation. Additionally, tissues involved in inflammation have increased levels of citrullinated proteins. Smoking may lead to increased formation of citrullinated proteins, which in the appropriate genetic background leads to autoimmunity to citrullinated proteins and subsequently the development of clinically apparent RA. This model of RA development is compelling at least in terms of anti-citrullinated peptides antiodies (ACPA) positive RA that occurs in smokers, although the specific anatomic sites and mechanisms by which smoking leads to ACPA generation and RA have yet to be elucidated.
Objectives: To evaluate the prevalence of tobacco smokers in different sub-groups of patients with RA. Sub-groups were formed according to the combination of positivity and negativity of ACPA and rheumatoid factor (RF).
Methods: We examined patients with rheumatoid arthritis. We performed examination of ACPA and RF at the baseline. We formed 4 sub-groups of patients with rheumatoid arthritis: ACPA positive and RF positive, ACPA positive and RF negative, ACPA negative and RF positive, ACPA negative and RF negative. We collected data from medical history concerning smoking status in each individual patient.
Results: The total number of 290 patients with rheumatoid arthritis was examined. There were 50 patients in the sub-group with ACPA positivity and RF positivity, 19 of them were smokers (38%, n=50). There were 13 patients in the sub-group with ACPA positivity and RF negativity, 5 of them were smokers (39%, n=13). There were 97 patients in the sub-group with ACPA negativity and RF positivity, 28 of them were smokers (29%, n=97). There were 130 patients in the sub-group with ACPA negativity and RF negativity, 28 of them were smokers (21%, n=130. The highest prevalence of smokers was in the sub-group of patients with ACPA and RF positive rheumatoid arthritis (39%) and ACPA positive and RF negative rheumatoid arthritis (38%). The prevalence of smokers in ACPA negative sub-groups of patients with rheumatoid arthritis is significantly lower.
Conclusions: We confirmed that prevalence of smokers is significantly higher in the sub-group of patients with ACPA positive rheumatoid arthritis than in the sub-group with ACPA negative rheumatoid arthritis. Quitting smoking is highly recommended especially to these patients in order to achieve a favorable effect on the course of the disease.

AB1127 HEALTH LOCUS OF CONTROL IN SYSTEMIC LUPUS ERYTHEMATOSUS – A CROSS-SECTIONAL ANALYSIS OF THE LULA-COHORT IN GERMANY 2013

G. Chehab[1], J.G. Richter[1], R. Brinks[1], R. Fischer-Betz[1], B. Winkler-Rohlfing[2], M. Schneider[1]. *[1]Policlinic of Rheumatology and Hiller Research Unit Rheumatology, Medical Faculty, Heinrich-Heine-University, Duesseldorf; [2]German Lupus Self-Help Community, Wuppertal, Germany*

Background: Health Locus of Control (HLC) is the degree to which individuals believe that their health is controlled by internal (self-responsibility) or external factors (healthcare professionals or chance). This generalized expectancy might affect different disease aspects, especially in chronic diseases.
Objectives: Our objective was to assess the influence of HLC on different disease aspects in a representative sample of German systemic lupus erythematosus (SLE) patients.
Methods: The LuLa-Study is a longitudinal survey on a multitude of SLE associated factors that is being conducted annually by means of a self-reported questionnaire among members of the German LE self-help community since 2001 and is ongoing. Inclusion criteria are a diagnosis of SLE and returning the completed paper questionnaire. Amongst others medication, health-related quality of life (Short-Form-12), damage (Brief index of lupus damage) and disease activity (Systemic Lupus Activity Questionnaire) are surveyed. In 2013 we additionally inquired about the health locus of control (HLC) that distinguishes between the "internal" HLCint (self-responsibility) and the two external dimensions HLCdoc and HLCchance considering their doctor respectively chance responsible for personal health. A high HLC was assumed for values above the upper quartile of the specific scales. Accessory questions examined fatigue (Fatigue severity scale), medication adherence (Morisky medication adherence scale), and illness perception (Brief illness perception questionnaire).

Results: Patients with a high internal health locus of control (HLCint 13.1 vs. 9.1) had less pain (numeric rating scale 0–10), less flares, a better mental and physical health related quality of life, lower disease activity and less fatigue. Patients with a high external 'doctor'-related health locus of control (HLCdoc 10.7 vs. 7.2) were older, had more co-morbidities, more disease damage and received more frequently an immunosuppressive therapy. No significant differences were found between the patients with a high external 'chance'-related HLC compared to the lower scoring patients (HLCcha 11.1 vs. 6.3). Participants with a high external 'doctor'-related HLC had a more threatening view on their illness and a better adherence to medication (high adherence in 78.6% vs. 59.4%). Participants with a high internal HLC perceived their disease significantly less threatening. Higher education levels (school education, further education) went along with a decrease of external 'doctor'-related HLC (HLCdoc).
Conclusions: Health locus of control has a significant impact in patients with SLE. Depending on the HLC different disease characteristics, treatments, levels of medication adherence and illness perception were noticed. Holistic care needs to consider the impact different HLCs may have. The direction of causality cannot be proved beyond reasonable doubt in this cross-sectional analysis. Hence additional longitudinal studies are necessary.

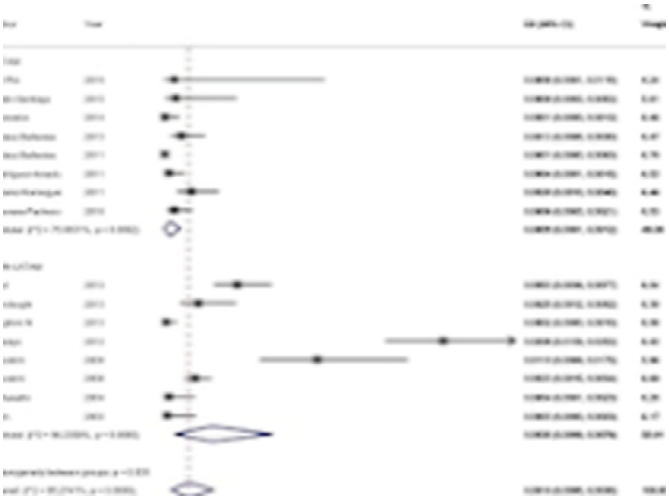
AB1128 HELICOBACTER PYLORI IN SYSTEMIC LUPUS ERYTHEMATOSUS ITS ASSOCIATION WITH ENDOSCOPIC AND HISTOPATHOLOGIC FINDINGS



I. Arroyo Prado[1], J.A. Velarde Ruiz Velasco[2], C.E. Gomez Lopez[1], S. Gutierrez Ureña[1], G. Martinez Bonilla[1], V. Gonzalez Diaz[1], J.I. Espejo Pascencia[3], S. Cerpa Cruz[1]. *[1]Rheumatology; [2]Gastroenterology; [3]Pathology, Fray Antonio Alcalde Hospital, Guadalajara, jalisco, Mexico*

Background: Helicobacter pylori (Hp) is a Gram-negative bacteria and the cause of most of the chronic gastric infections and its prevalence is above 50% worldwide. This infection is a well-known risk factor to gastric MALT lymphoma but also could be the trigger of several autoimmune diseases such as immune thrombocytopenic purpura and systemic lupus erythematosus
Objectives: To determine the frequency of H pylori in systemic *lupus erythematosus patients* (SLE).
Methods: A cross-sectional study was done in patients who fulfilled the 2012 SLICC criteria for SLE and were willing to sign the informed consent to be subjected to endoscopic procedure. The tissue sample was analyzed by pathologist. We used mean and standard deviation to describe the data, to compare both groups Student t test was done and for continuous variables we used chi-square; the correlation analysis was performed with
Results: Twenty two SLE patients were included and we chose a control group from database of endoscopic clinic with diagnosis of functional dyspepsia. Mean age of study group was 31 vs 48 year-old, 95% were women, 32% with immunosuppressant and 95% were taking *antimarials*. The frequency of Hp in SLE patients was 60%, dsDNA and anti-Ro autoantibodies were associated with the presence of Hp; the study group had more frequency of nodular gastritis, metaplasia and dysplasia. Seventy per cent of patients had less than 5 years of diagnosis.
Conclusions: We found a high frequency of H pylori infection in patients with SLE. Metaplastic and dysplastic changes were also more prevalent in the SLE group. Our data suggest that Hp infection took place in early stages of disease.

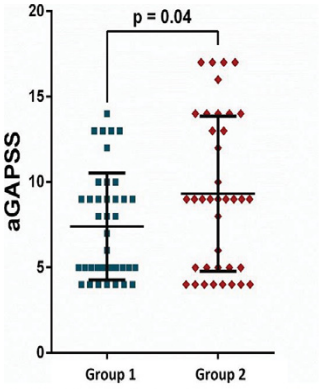
AB1129 A SYSTEMATIC REVIEW ON PREVALENCE OF BACK PAIN AND SPONDYLOARTHRITIS BASED ON COPCORD STUDIES

J. Moreno-Montoya[1], J. Rodriguez-Amado[2], R. Burgos-Vargas[3], I. Pelaez-Ballestas[3]. *[1]Universidad del Bosque, Bogota, Colombia; [2]Research Associate of South Florida, Miami, United States; [3]Rheumatology Unit, Hospital General de Mexico, Mexico, Mexico*

Objectives: To determine, through a systematic review and meta-analysis, the prevalence of back pain (BP) and spondyloarthritis (SpA) in the adult general population and explore the heterogeneity between studies in and out Latin America (LATAM).
Methods: MEDLINE, Embase, BIREME, LILLACS and Web of Science were searched using a strategy combining key words and related database-specific subject terms to identify relevant cross-sectional studies based on COPCORD methodology published since 2006. Included articles were assessed for risk of bias and quality based on the STROBE statement. Prevalence figures for BP and SpA (European Spondyloarthropathy Study Group criteria) were analyzed according to female percentage of sampled individuals, mean age and sample size. A mixed effect model was used to obtain the combined prevalence and a meta-regression to estimate the effects of these variables. Prevalence stratified values were obtained according to its geographical location.
Results: 44 out of 127 papers in English, Spanish or Portuguese were selected. Of them, 16 contained BP or SpA prevalence data. Estimates for any Spa prevalence ranged from 0,1% to 2%, with an average of 0,3% (95% CI: 0,01%>0,05%). The random-effects pooled prevalence was 0,18% (0,06%>0,36%). The prevalence of BP was 6.54% (3.8%>9.2%) with a pooled value of 5.24% (2.6%>8.7%). In both cases the heterogeneity was significant ($p<0.01$). No effect was associated to SpA heterogeneity, but an increase in the prevalence of BP was associated to sample size (random effect coefficient: 0,045, p=0.04). The stratified analysis did not show differences in terms of heterogeneity or prevalence for BP (Pooled prevalence for BP: 5.4%; 2.9%>8.5%, p=0.9); on the contrary, for Spa, for non-LATAM studies, the pooled proportion was significant bigger (prevalence in LATAM 0.05%, 0.01%>0.012%; non-LATAM: 0.35%, 0.09%>0.78%, p=0.03)



Conclusions: We found significant variations in prevalence across this review. In particular, they related to sample size of BP studies. Similarly, there was a significant variation between LATAM versus other latitudes respect to the prevalence of SpA. The limited number of studies included in this meta-analysis however, prevents clear explanations of the mechanisms underlying these results.

AB1130 RELAPSE RISK ASSESSMENT IN YOUNG APS PATIENTS WITH PREVIOUS STROKE EVENT USING THE ADJUSTED GLOBAL ANTIPHOSPHOLIPID SYNDROME SCORE (AGAPSS)

I. Cecchi[1], M. Radin[1], K. Schreiber[2], M.J. Cuadrado[3], C. Perez-Sanchez[4], C. Lopez-Pedrera[4], D. Roccatello[5], S. Sciascia[5]. *[1]Department of Clinical and Biological Sciences, Center of Research of Immunopathology and Rare Diseases- Coordinating Center of Piemonte and Valle d'Aosta Network for Rare Diseases, Turin, Italy; [2]Department of Thrombosis and Haemophilia, Guy's and St Thomas' Hospital; [3]Guy's and St Thomas' NHS Foundation Trust, London, United Kingdom; [4]GC-5/Rheumatology, IMIBIC/Reina Sofia Hospital/University of Cordoba, Cordoba, Spain; [5]Department of Clinical and Biological Sciences, Center of Research of Immunopathology and Rare Diseases - Coordinating Center of Piemonte and Valle d'Aosta Network for Rare Diseases, Turin, Italy*

Background: The most frequent manifestation of arterial thrombosis in patients affected by Antiphospholipid syndrome (APS) is ischaemic stroke, especially in young adults (less than 50 years old) [1]. Young adults affected by APS are a group of patients at greater risk of developing serious stroke events and recurrences of thrombosis. Therefore, risk stratification in this particular group is crucial, especially in order to prevent a recurrence of ischaemic thrombotic event.
Objectives: With the present study we aimed to assess the clinical usefulness of the adjusted Global AntiphosPholipid Syndrome Score (aGAPSS) [3] for risk stratification of thrombosis relapse and/or progression of known ischaemic lesions dectected with Magnetic Resonance Imaging (MRI) in a cohort of young adult APS patients.

Methods: The analysis included 80 APS patients (≤50 years old) who presented a previous stroke event (patients who experienced cerebral venous sinus thrombosis were not included in the analysis). Clinical and laboratory data were retrospectively collected. Treatment was based on phisician's opinion according to clinical settings. The aGAPSS was calculated for each patient by adding the points corresponding to the risk factors, based on a linear transformation derived from the β regression coefficient as follows: 3 for hyperlipidaemia, 1 for arterial hypertension, 5 for aCL IgG/IgM, 4 for antiβ2glycoprotein I IgG/IgM and 4 for LA. Relapse was defined as the recurrence of thrombotic event and/or progression of known ischaemic lesions detected with MRI.
Results: Results pointed out that patients with relapse of thrombotic events and/or progression of known ischaemic lesions were 39 out of 80 (48.7%) and patients without relapse were 41 out of 80 (51.3%). Significantly higher aGAPSS values were observed in relapse group when compared to the non-relapse group [mean aGAPSS 9.08 (S.D. 4.7) Vs. mean aGAPSS 7.22 (S.D. 3.3); T test: $p<0.05$]. Distribution of aGAPPS values among the two groups is illustrated in Graph 1.

Graph 1.: Distribution of aGAPPS values among the two groups; Group 1: patients without relapse of thrombotic events and/or progression of known ischaemic lesions detected with MRI; Group 2: patients who presented relapse of thrombotic events and/or progression of ischaemic lesions.

Conclusions: Our analysis suggests that aGAPSS could represent an effective tool to stratify the risk of relapse of thrombosis and/or progression of ischaemic lesions in young APS patients with clinical history of stroke. These data could also aid developing different therapeutic approaches, especially for patients at higher risk of relapse.

AB1131 RISK OF DEVELOPING ATHEROSCLEROSIS IN PATIENTS WITH RHEUMATOID ARTHRITIS

I. Starodubtseva. *Internal Diseases, Nn Burdenko Voronezh State Medical University, Voronezh, Russian Federation*

Background: Patients with chronic inflammatory diseases have an increased risk of developing atherosclerosis. Pro-inflammatory cytokines such as interleukin-(IL-)1beta and tumor necrosis factor-(TNF-)alpha, C-reactive protein (CRP) influence on the progression and development of both rheumatoid arthritis (RA) and atherosclerosis.
Methods: 620 patients with RA (diagnosis according to ACR /EULAR) from the rheumatology in-patient clinic with the mean age of 43.4±10; 95.4% ACCP – positive patients, activity on DAS (Disease Activity Score) 28 II, III; 85.4% female with the disease duration for about 3–15 years were enrolled in the trial. We assessed the level of IL-1 with the use of ELISA.
Results: The constructed model surfaces indicated the interdependence of IL-1, the activity of DAS 28 and the level of LDH in RA patients. The correlative and regressive analysis of the results showed the statistically significant correlation of TG, LDG and markers of inflammation IL-1, DAS 28: p=0.627 ($p<0.01$), p=0.527 ($p<0.01$), p=0.712 ($p<0.01$), p=0.776 ($p<0.01$) accordingly. The correlation coefficient between hs-CPR and the indicators of the lipid profile revealed similar interconnections.
Conclusions: According to the results of modeling, disease activity on DAS and markers of inflammation (IL-1 and hs-CRP) as a markers of the severity of inflammatory process in RA patients are risk factors for developing atherosclerosis. The analysis of inflammation indicators in RA patients allows to assess the risk of developing and progressing atherosclerosis. The data enables to select the best possible personified therapy for such patients at the early stage of the disease.

AB1132 HIGHER RATES OF OBESITY AND ASSOCIATIONS WITH POORER CLINICAL STATUS IN PATIENTS WITH RA, OA AND SLE: A CROSS-SECTIONAL STUDY FROM ROUTINE CARE

I. Castrejon, N. Shakoor, J.A. Block, T. Pincus. *Rheumatology, Rush University Medical Center, Chicago, United States*

Background: Obesity is a risk factor for many chronic rheumatic diseases. In rheumatoid arthritis (RA), obesity is associated with increased comorbidities, higher medical costs, disease activity, and poorer physical function[1]. In OA, obesity is a risk factor for both incidence and progression, and has a negative impact on outcomes[2]. In systemic lupus erythematous (SLE), obesity is associated with more severe renal involvement, lower quality of life, and increased cardiovascular risk[3].
Objectives: To assess associations of obesity with patient self-report multidimensional health assessment questionnaire (MDHAQ) scores and physician global assessments in patients with RA, OA and SLE seen in routine care.
Methods: All patients at one academic center complete a MDHAQ, which includes a 0–10 scale for physical function (FN), 0–10 visual analogue scales (VAS) for pain (PN) and patient global assessment (PATGL), compiled into a 0–30 RAPID3, as well as scales for fatigue, depression, and demographic data. Physicians complete a VAS for patient global (DOCGL). Body Mass Index (BMI) was calculated from the medical record as weight (kg)/ height (meters)^2. Patients were classified by BMI as normal (18.5–25), overweight (25–30), or obese (>30) according to the WHO guidelines. Demographic and clinical MDHAQ data were compared in the 3 diagnostic groups according to BMI groups using ANOVA and chi-square tests.
Results: 396 patients with RA, 425 with OA, and 306 with SLE were studied. Obesity was reported by 40% of RA and SLE patients, and 59% of OA patients, a higher percentage than matched individuals in the general population in the same region (30.8%). Obesity was higher in African-American patients (48% in RA, 70% in OA, and 53% in SLE). Education level, gender, and age did not differ significantly across the groups. Obesity was associated with poorer physical function, poorer patient global and higher pain in all 3 diagnostic groups, with higher depression scores in OA and SLE (Table). DOCGL was significantly higher only in OA (data not shown).

Table 1. MDHAQ scores and physician global assessment according to BMI groups

MDHAQ scores	Normal (BMI=18.5–25)	Overweight (BMI=25–30)	Obesity (BMI>30)
RA (N=381)	110 (29%)	112 (30%)	154 (40%)
Function (0–10)	2.1 (2.2)	2.4 (2.2)	2.9 (2.0)*
Pain (0–10)	4.4 (2.8)	4.6 (3.0)	5.1 (3.1)*
Fatigue (0–10)	3.4 (2.9)	3.6 (3.1)	4.5 (3.2)*
PATGL (0–10)	3.8 (2.7)	4.1 (3.1)	4.8 (2.8)*
Depression (0–3.3)	0.5 (0.7)	0.5 (0.7)	0.6 (0.8)
OA (N=420)	60 (14%)	102 (24%)	247 (59%)
Function (0–10)	1.7 (1.5)	2.6 (1.8)	3.2 (2.0)*
Pain (0–10)	5.1 (2.9)	6.7 (2.5)	6.6 (2.6)*
Fatigue (0–10)	3.4 (2.9)	4.3 (2.9)	5.3 (3.1)*
PATGL (0–10)	4.5 (3.1)	5.7 (2.5)	5.9 (2.7)*
Depression (0–3.3)	0.4 (0.6)	0.6 (0.8)	0.7 (0.8)*
SLE (N=299)	84 (28%)	85 (28%)	121 (40%)
Function (0–10)	1.4 (1.5)	1.2 (1.6)	2.3 (2.1)*
Pain (0–10)	3.5 (3.2)	3.9 (3.1)	5.2 (3.3)*
Fatigue (0–10)	4.2 (3.3)	4.2 (3.4)	5.1 (3.2)
PATGL (0–10)	3.6 (2.9)	3.9 (3.1)	4.6 (3.2)*
Depression (0–3.3)	0.4 (0.6)	0.4 (0.6)	0.7 (0.8)*

*$p<0.01$.

Conclusions: Obesity is more prevalent in patients with rheumatic diseases compared with the general population. Obese patients had poorer status on most MDHAQ scores, particularly physical function and pain. Obesity is an important comorbidity in patients with rheumatic diseases.

AB1133 HIGH CONSUMPTION OF SEAFOODS OR VEGETABLES NEGATIVELY CORRELATES WITH DISEASE ACTIVITY OF RHEUMATOID ARTHRITIS

I. Murakami[1], K. Murakami[1], M. Hashimoto[2], M. Torii[3], K. Ikeda[4], A. Kuwabara[5], K. Tanaka[6], A. Yoshida[1], T. Usui[1], N. Kuramoto[1], R. Nakashima[1], Y. Imura[1], H. Yoshifuji[1], M. Tanaka[2], K. Ohmura[1], T. Mimori[1]. *[1]Department of Rheumatology and Clinical immunology, Graduate School of Medicine; [2]Department of the Control for Rheumatic Diseases, Graduate School of Medicine; [3]Department of Human Health Sciences, Graduate School of Medicine; [4]Department of Diabetes, Endocrinology and Nutrition, Graduate School of Medicine, Kyoto University, Kyoto; [5]Department of Health and Nutrition, Osaka Shoin Women's University, Osaka; [6]Department of Food and Nutrition, Kyoto Women's University, Kyoto, Japan*

Background: Food intake is one of the important environmental factors of various diseases, and possibly influences the pathogenesis of RA. However, we have little knowledge about the impact of food intake on the pathogenesis of RA. Because each country has its own food culture, the study focused on the dietary habit in Japan is essential in order to clarify the clinical impact of food intake in Japanese RA patients.
Objectives: The aim of this study is to clarify the relationship between the dietary habit of RA patients and their disease status.
Methods: We took the questionnaire survey about dietary habit in 2015, in KURAMA (Kyoto University Rheumatoid Arthritis Management Alliance) cohort as single institute. Disease activity was also examined in this cohort. These data were combined and statistically analyzed.
Results: 563 RA patients were enrolled from KURAMA cohort; female: male 4:1, age 63 years old, disease duration 15.5 years, DAS28-ESR 2.8 on average. Multivariate analysis showed that the intake frequency of vegetables had statistically significant negative correlation with DAS28-ESR (β=–0.17, $p<0.01$), SDAI (β=–0.15, $p<0.01$), HAQ (β=–0.15, $p<0.01$) and MMP-3 (β=–0.13, $p<0.01$). The intake frequency of frozen foods had positive correlation with MMP-3 (β=0.12,$p<0.01$). The intake frequency of juice had positive correlation with DAS28-ESR (β=0.11,$p<0.01$) and SDAI (β=0.11,$p<0.01$). Factor analysis revealed five dietary patterns, which were labeled "seafoods", "meat and fried foods", "vegetables and fruits", "snacks" and "processed foods". The "seafoods" had statistically significant negative correlation with DAS28-ESR (β=–0.10, p=0.027), SDAI (β=–0.11, p=0.015), HAQ (β=–0.11, p=0.015) and MMP-3 (β=–0.11, p=0.013). The "vegetables and fruits" had also statistically significant negative correlation with DAS28-ESR (β=–0.13, $p<0.01$), SDAI (β=–0.14, p=0.015), HAQ (β=–0.17, $p<0.001$) and MMP-3 (β=–0.14, $p<0.01$).
Conclusions: This study implicates that the disease activity of RA may be alleviated by high consumption of vegetables and fruits, or seafoods.

AB1134 CHARACTERISTICS OF AUTOIMMUNE FEATURED INTERSTITIAL LUNG DISEASE IN KOREAN PATIENTS

J.-H. Kim, J. Jae Hyun, Y.H. Seo, S.J. Choi, G.G. Song. *Inrernal medicine, Korea University Medical center, Seoul, Korea, Republic Of*

Background: Interstitial lung disease (ILD) includes a heterogeneous group of disorders that result in diffuse parenchymal lung disease, with overlapping clinical, radiographic, and physiologic manifestations. Several rheumatologic conditions are associated with the development of ILD. There are many patients who are not diagnosed as definite connective tissue disease (CTD). These patients may have an undifferentiated connective tissue disease (UCTD).
Objectives: The aim of this study was to compare the prevalence and characteristics of patients with CTD-ILD, UCTD-ILD and Idiopathic pulmonary fibrosis (IPF) in Korean patients.
Methods: We study compared the prevalence and characteristics of patients with connective tissue disease-associated interstitial lung disease (CTD-ILD), undifferentiated connective tissue disease-associated interstitial lung disease (UCTD-ILD), or idiopathic pulmonary fibrosis (IPF) between January 2015 and June 2016 in Korea university guro hospital. Clinical characteristics, laboratory tests, and high-resolution CT images were analyzed and compared among three groups.
Results: CTD-ILD was identified in 13.0%, UCTD-ILD in 18.2%, and IPF in 68.7% among 307 patients. Female and younger age patients were dominant in CTD-ILD group. Pulmonary symptoms were more common in IPF, while extra-pulmonary symptoms were more common in CTD-ILD and UCTD-ILD group. Patients with CTD-ILD had more abnormal antibody tests than those of UCTD-ILD and IPF. Usual interstitial pneumonia pattern was dominant in HRCT images among three groups.
Conclusions: CTD-ILD is not able to be diagnosed accurately in ILD patients. A systematic evaluation of extra-pulmonary symptoms and serologic tests in patients with ILD can identify CTD-ILD, UCTD-ILD, and IPF.

AB1135 ALLOPURINOL AND THE RISK OF INCIDENT PERIPHERAL ARTERIAL DISEASE IN THE ELDERLY AMERICANS: A U.S. MEDICARE CLAIMS DATA STUDY

J. Singh, J. Cleveland. *University of Alabama at Birmingham, Birmingham, United States*

Background: Recently we found that use of allopurinol, the most commonly used urate-lowering therapy (ULT), was associated with a reduction of the risk of myocardial infarction and stroke, acute manifestations of CAD. Given that both PAD and CAD are manifestations of atherosclerosis and a similarity of disease pathophysiology between them, an obvious question was whether allopurinol use would reduce PAD. To our knowledge, no previous studies have examined whether allopurinol use reduces the risk of PAD.
Objectives: To examine whether new allopurinol use is independently associated with a reduction of the risk of incident peripheral arterial disease (PAD) in the U.S. elderly.
Methods: We used the 5% random Medicare sample from 2006–2012 to examine the association of allopurinol use and its duration with risk/hazard of incident PAD, in a retrospective cohort study. Multivariable Cox regression models adjusted for demographics, comorbidity, cardiac medications and cardiac conditions. Hazard ratios (HR) and 95% confidence intervals (CI) were calculated.
Results: We identified 26,985 episodes of incident allopurinol use in 25,282 beneficiaries, of which 3,167 allopurinol use episodes (12%) ended in incident PAD. In multivariable-adjusted analyses, allopurinol use was associated with HR of 0.88 (95% CI, 0.81, 0.95) for incident PAD, as was female gender, 0.84 (95% CI, 0.78, 0.90). In a separate multivariable-adjusted model, compared no allopurinol use, longer durations of allopurinol use were associated with lower HR of PAD: 181 days to 2 years, 0.88 (95% CI, 0.79, 0.97) and $>$2 years, 0.75 (95% CI, 0.63, 0.89). Other factors significantly associated with a higher hazard of PAD were age 75-$<$85 and $\geq$85, female gender, higher Charlson index score, and black race. Sensitivity analyses adjusting for cardiac conditions and medications, confirmed these findings with minimal to no attenuation of hazard ratios.
Conclusions: New allopurinol use was independently associated with a lower risk of PAD in the elderly. Longer allopurinol use durations seemed more protective. Mechanisms of protective effect need to be studied in future studies.

AB1136 THE AGE OF ONSET OF RHEUMATOID ARTHRITIS CORRELATES WITH AIR POLLUTION AND HEALTH EXPENDITURE: RESULTS FROM MULTINATIONAL DATABASES

J.D. Castillo-Ortiz[1], A. Barajas-Ochoa[1], I. Peláez-Ballestas[2], A. Ramirez-Gomez[1], F.J. Aceves-Avila[1,3], J.J. Castaneda-Sanchez[1], C. Ramos-Remus[4]. *[1]Unidad de Investigacion en Enfermedades Cronico-Degenerativas, Guadalajara; [2]Hospital General de Mexico, Ciudad de Mexico; [3]Hospital General Regional 46, IMSS; [4]Universidad Autonoma de Guadalajara, Guadalajara, Mexico*

Background: Environmental variables contribute up to half of the variation in the rheumatoid arthritis (RA) susceptibility. We have recently reported that the age of RA onset (RAo) varies across latitudes around the world, starting younger around the Tropic of Cancer (1). Latitude gradients have been used as a surrogate for studying the influence of the environment on the risks of disease in order to generate hypotheses for further investigation.
Objectives: This is an exploratory study to assess whether the age of RAo correlates with tropospheric pollutants (2), electromagnetic fields, Inequality-adjusted Human Development Index (I-HDI) and Health Expenditures as per national census of participating countries.
Methods: The age of RAo was obtained from the GEO-RA group database that involves 2,481 patients from 41 countries. Information of the tropospheric pollutant PM10 (particulate matter 10μ), the I-HDI, and Health Expenditures per capita was obtained from the World Health Organization's reports. The average of each country's electromagnetic fields (nanotesla, nT) from the past 50 years was calculated using geographic coordinates per country through the magnetic field calculator of The National Centers of Environmental Information. Pearson's correlation and linear regression were used to evaluate the correlation of these environmental variables with the age of RAo by country.
Results: Complete data sets were available in 35 of the 41 countries. Overall, the mean age of RAo was 44±4.8 years, the annual average of PM10 of 57.5±39.3 $\mu g/m^3$, the Health Expenditure per capita of US $2,212±2,742, and the electromagnetic fields of 41,900±8,720 nT. The age of RAo was younger in countries with high PM10 levels (r= -0.61, $p<0.01$), high inequality (I-HDI, r=0.59,

p<0.01), and low Health Expenditure per capita (r=0.61, p<0.01); the age of RAo did not correlate with nT. A significant linear regression equation was found [F(2,32)=13.61, p<0.01, R2=0.46] in the age of RAo, Health Expenses per capita (β=0.0007; CI 95% 0.00004 to 0.001) and PM10 levels (β=-0.044; CI 95% -0.085 to -0.002).

Conclusions: The tropospheric pollutant PM10 and the components of the Health Expenditure per capita such as the provision of health services, family planning activities and nutrition activities are variables worth to further study through hypothesis-testing designs.

Pelaez-Ballestas[14] on behalf of GEEEMA/GLADERPO. *[1]Epidemiology, Universidad del Bosque, Bogota, Colombia; [2]Faculty of Medicine, Universidad Autonoma de Chihuahua, Chihuahua, Mexico; [3]Rheumatology Unit, Hospital Dr. Manuel Nuñez Tovar, Maturin, Venezuela, Bolivarian Republic Of; [4]Faculty of Medicine, Universidad de la Sabana, Bogota, Colombia; [5]Faculty of Medicine, Universidad de Cuenca, Cuenca, Ecuador; [6]Rheumalogy Unit, Hospital Provincial, Rosario, Argentina; [7]Research Unit, Clinica Reumacenter, Juliaca, Peru; [8]Rheumatology Dpt., Hospital Universitario, Monterrey; [9]Research Unit, IMSS, Mexico City, Mexico; [10]Rheumatology Dpt., Hospital Provicial, Rosario, Argentina; [11]UNAM, Mexico; [12]Research Unit, HARE, Merida, Mexico; [13]Universidad de la Sabana, Bogota, Colombia; [14]Rheumatology Unit, Hospital General de Mexico, Mexico, Mexico*

Objectives: To determine the impact of individual and regional variables on the geographic distribution of RD across six Latin-American countries

Methods: This is a secondary multilevel analysis of cross-sectional data of COPCORD studies that investigated the prevalence of RD in Argentina, Colombia, Ecuador, México, Peru, and Venezuela. Individual factors were sex, age, comorbidities, job status, and Health Assessment Questionnaire (HAQ) score. Contextual level variables were country and subject's identification as indigenous. RD predictors, including individual and regional variables, particularly indigenous status were identified with logistic regression models. The effect of contextual variables was estimated with median odds ratio's (OR) estimation.

Results: Most individuals included in this analysis came from urban areas (82.40%); their mean age was 43.12 years (95% CI 43.01–43.35); and 56.0% were women. Nearly all of them reported >1 comorbidity (94.70%) and 72.19% were economically active. The prevalence of any RD varied from 1.55% in Peru to 26.09% in Argentina. The mean prevalence of Rheumatoid Arthritis (RA) was 1.58 (range 0.64 to 2.47) (table 1). Aside comorbidities, individual level variables associated to any RD were sex (OR: 1.35; 95% CI 1.28–1.43), age (OR: 1.02; 95% CI 1.01 -1.03), and HAQ score (OR: 3.71; 95% CI 3.22–4.28). Crude comparisons showed significant variations among countries (p<0.01) and indigenous groups (OR: 1.69; 95% CI 1.58–1.81). These findings were confirmed by adjusted analysis (Median OR 1.26; 95% CI 1.14–1.38) (table 2).

Table 1. General prevalences and sample sizes across countries

Country	n	%	Prevalence %			
			Any RD	RA	OA	Fibromyalgia
Argentina	1656	3.94	26.09	2,42	3.86	0.06
Colombia	6734	16.01	6.53	0,64	5.18	0.25
Ecuador	4877	11.60	13.2	0,88	10.58	2.05
Mexico	22175	45.69	18.34	2,47	12.01	0.82
Peru	1095	2.60	1.55	0,65	0.55	0.09
Venezuela	5512	9.45	14.94	0,9	16.47	0.38

AB1138 ENGAGEMENT IN A UK SMARTPHONE STUDY EXAMINING THE ASSOCATION BETWEEN WEATHER AND PAIN: PRELIMINARY RESULTS FROM CLOUDY WITH A CHANCE OF PAIN

K.L. Druce[1], J. McBeth[1,2], S.N. van der Veer[1], D.A. Selby[3], B. Vidgen[4], K. Georgatzis[5], A.M. Chowdry[1], R. Lakshminarayana[6], D.M. Schultz[7], C. Sanders[8], J.C. Sergeant[1,2], W.G. Dixon[1,2]. *[1]Arthritis Research UK Centre for Epidemiology, University of Manchester; [2]NIHR Manchester Musculoskeletal Biomedical Research Unit, Central Manchester University Hospitals NHS Foundation Trust, Manchester; [3]Department of Statistics, University of Warwick, Coventry; [4]Oxford Internet Institute, University of Oxford, Oxford; [5]School of Informatics, University of Edinburgh, Edinburgh; [6]uMotif, London; [7]Centre for Atmospheric Science, School of Earth and Environmental Sciences; [8]Medical Sociology, Division of Population Health, Health Services Research and Primary Care, University of Manchester, Manchester, United Kingdom*

Background: Smartphones can facilitate collection of temporally-rich self-reported data, and have proven to enable large recruitment. However, their viability to support epidemiological research is uncertain due to concerns about selection bias and unsustained engagement.

Objectives: To examine the characteristics and engagement of participants in the first six months of Cloudy with a Chance of Pain, a UK smartphone-based study investigating the link between the weather and chronic pain.

Methods: Between 20th of January and 29th of February 2016, we recruited UK residents 17 years or older with chronic pain (≥3 months) who owned a smartphone. Participants received prompts from an app developed by uMotif, which they used to daily report the severity of ten pain-related symptoms. Of those who enrolled, those eligible for analysis provided sufficient baseline data to confirm they were ≥17 years old, and at least one symptom. The characteristics of those who were eligible were examined. Engagement per day was defined based on whether participants had completed any of the ten symptoms. Participants were then clustered by their engagement over time using a first-order hidden Markov models. Participant characteristics were then compared between the clusters.

Results: Of 7972 people who registered to participate, 6370 were eligible. 81% of participants were female, with a mean age of 49 years (SD 12.9). The most common diagnosis was arthritis (40% type unspecified, 19% rheumatoid arthritis), followed by fibromyalgia/chronic widespread pain (24%) and "other pain diagnosis" (23%). We identified four clusters of engagement: high (14%), moderate (22%), low (39%) and tourists (25%). Median days of data entry ranged from 1 (1–1) to 175 (IQR: 152–177) for the tourist and high engagement clusters respectively. Those in the high and moderate clusters (n=2249, 35%) engaged on at least 50% of days in the study (high: 79%; moderate: 50%). Highly engaged participants were older (median 56 (47–63)) when compared to those who were low engagers (47 (39–57)) or tourists (49 (40–58)). A lower proportion of tourists were women (76% (95% CI: 74–78), than in any other cluster (high: 82% (80–85), moderate: 84% (82–86), low: 81% (79–82)).

Conclusions: Cloudy with a Chance of Pain recruited a large sample of people with chronic pain, of whom over one in three participants engaged in smartphone-based symptom reporting for at least 50% of days in the first six months. Smartphone studies enable quick mass participation with sustained daily data entry, providing unprecedented volumes of daily data. While there may be selection bias towards older females in our study, younger men are also less likely to participate in studies using traditional data collection methods. Our study suggests that smartphones could provide a viable alternative to traditional data collection methods.

AB1139 AUTOANTIBODY AGAINST COMPLEMENT COMPONENT 1Q SUBCOMPONENT IS ASSOCIATED WITH THE PATHOGENESIS OF RECURRENT PREGNANCY LOSS

K. Ohmura[1], K. Oku[1], T. Kitaori[2], M. Kono[1], S. Tanimura[1], E. Sugawara[1], R. Hisada[1], H. Nakamura[1], S. Shimamura[1], Y. Fujieda[1], M. Kato[1], T. Bohgaki[1], O. Amengual[1], S. Yasuda[1], M. Sugiura-Ogasawara[2], T. Atsumi[1]. *[1]Division of Rheumatology, Endocrinology and Nephrology, Hokkaido University Graduate School of Medicine, Sapporo; [2]Department of Obstetrics and Gynecology, Nagoya City University Graduate School of Medical Sciences, Nagoya, Japan*

Background: In recurrent pregnancy loss (RPL), the pathogenesis of the majority of cases remains to be explained. Antiphospholipid, syndrome (APS) is one

of the disorder responsible for causing RPL and its overwhelmed complement activation recognized as a major pathogenic mechanism. Autoantibodies against complement component 1q subcomponent (aC1q) have been shown to associate with complement activation in primary APS, but the relevance of aC1q in RPL is still unclear. We hypothesized that aC1q would be associated with the pathogenesis of RPL in patients with or without APS, especially in RPL of unknown etiology.
Objectives: The aim of this study was to explore the significance of aC1q in RPL.
Methods: As a clinical study, we conducted a retrospective cross-sectional study comprising a total of 134 patients with RPL of unknown etiology, 27 with obstetric APS (OAPS), 14 parous patients with connective tissue disease (CTD) without historical obstetric/thrombotic complications and 17 parous healthy controls (HC). Serum levels of aC1q were measured using a solid-phase ELISA (Buhlmann Laboratories AG, Switzerland) and defined as positive using cut-off value of more than 15 U/mL according to the manufacturer. In murine model, 8–12 week-old female BALB/c mice were mated with isolated males and the presence of vaginal plug was defined as day 1 of pregnancy. Mice were treated with intravenous injections of anti-mouse C1q monoclonal antibody (JL-1), isotype control IgG2b or PBS. To block C5a receptor (C5aR), mice were intravenously pre-treated with anti-C5aR antibody, 30 minutes before the injection of JL-1 on day 8. Mice were sacrificed on day 16 of pregnancy and fetal resorption ratios, weight of fetuses and placentas, serum levels of C3a and immunohistochemical staining of complement components on placental tissue were compared among each group.
Results: Among RPL, OAPS, CTD and HC, 47 (35%), 8 (30%), 3 (21%) and 2 (12%) were positive for aC1q, respectively. In RPL patients, aC1q was more prevalent ($p<0.05$) and its titer was significantly higher than in HC (median and interquartile range [IQR] 12 [8–21] vs. 0 [0–4.3], $p<0.0001$) (Figure 1). In murine model, fetal resorption ratio was higher ($p<0.01$), weight of fetuses and placentas lower ($p<0.05$), and serum levels of C3a higher ($p<0.01$) in mice treated with JL-1 than in control mice. Immunohistological findings showed that complement components were more deposited on placenta in JL-1 treated mice than in control mice. Furthermore, the additional blockade of C5aR cancelled the pathogenic changes in JL-1 treated mice.

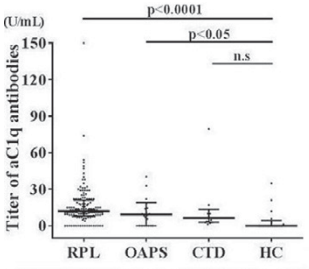

Figure 1. Titers of anti-C1q antibodies (aC1q) among recurrent pregnancy loss (RPL), obstetric antiphospholipid syndrome (OAPS), connective tissue disease (CTD) and healthy controls (HC) groups.
The titers of aC1q were significantly higher in RPL and OAPS compared to HC group (Dunn test). Horizontal bars show median and whiskers indicate the first and third quartiles.

Conclusions: Clinical findings showed that aC1q could be relevant to RPL. Moreover, we have established aC1q induced pregnancy loss model mice. Our study indicates that aC1q has a pathophysiologic role in RPL and that anticomplement therapy might be effective for at least some groups of patients with RPL for whom specific treatment remains to be established.

AB1140 WHO DISABILITY ASSESSMENT SCHEDULE 2.0 IS RELATED TO UPPER AND LOWER EXTREMITY SPECIFIC QUALITY OF LIFE

K.S. Park, Y.-H. Cheon. *Gyeongsang National University, Jinju, Korea, Republic Of*

Background: Musculoskeletal complaints influence disability, but the relative contribution of concurrent upper and lower extremity health-related quality of life (HRQOL) on patient perceptions of disability is unclear.
Objectives: We evaluated whether two disease specific quality of life instruments (DASH and WOMAC) reflect a patient's perception of general disability using the WHO Disability Assessment Schedule 2.0 (WHODAS 2.0) and determined whether disability components are explained by upper and lower extremity HRQOL.
Methods: We recruited 421 randomly chosen participants 50 years or older without stroke, cancer, or history of surgery for musculoskeletal disease who participated in the Namgang Cohort. Upper extremity HRQOL was determined with the DASH score and lower extremity HRQOL with the WOMAC; as a measure of disability, we obtained WHODAS 2.0 component. Multiple regression modeling was used to assess the relative contributions made by upper and lower extremity HRQOL to disability.
Results: Most patients reported knee pain (61.0%), shoulder (17.1%), elbow (28.5%) and hand (56.1%). Mean WHODAS 2.0 total score was 28.06 (SD=14.2), corresponding to mild to moderate disability and WOMAC and DASH scores were 23.2 (SD=22.1) and 22.4 (SD=19.3). When adjusted for age, sex, level of education, spouse, self rated health, hypertention, DM and depression, the DASH total score was correlated with the getting around (β=0.137, p=0.032) and social participation (β=0.226, $p<0.001$) and the WOMAC total score was correlated with the getting around (β=0.362, $p<0.001$) and social participation (β=0.289, $p<0.001$)
Conclusions: We found that in a community-based population, perceived actibity limitation and social participation were associated with upper and lower extremity HQRQOL. Since the WHODAS 2.0 does not target a specific disease (as oppose to the DASH, WOMAC), it can be used to compare disabilities caused by different diseases.

AB1141 PREVALENCE OF LONG-TERM STEROID THERAPY: FRENCH DATA

L. Couvaras, S. Trijau, G. De Lamotte, V. Pradel, T. Pham, P. Lafforgue. *APHM, Marseille, France*

Background: Corticosteroids are widely used for various diseases, from chronic respiratory conditions to auto-immune disorders. However, there are few epidemiological data about long-term steroid therapy in southern Europe (1, 2, 3).
Objectives: To describe chronic glucocorticoid prescriptions in a large cohort.
Methods: Information was collected from a national public health-insurance database that covers 4.1 million individuals and 83% of the population, in our geographic area of Provence-Alpes-Côte-d'Azur and Corsica, from September 1, 2009 through August 31, 2011. We identified subjects aged of 15 years and over starting glucocorticoid therapy. Chronic glucocorticoid therapy was defined as $\geq$7.5mg of prednisone equivalent per day during at least 90 days consecutive. We identified the incident cases of long-term glucocorticoid therapy, defined as those prevalent cases who did not fill glucocorticoid prescriptions during the first 6 months of the 24-month study period.
Results: We identified 32,812 patients who were prescribed glucocorticoid therapy, yielding 0.97% prevalence. Of these 32,812 patients, 14,205 (43.3%) met our definition of incident cases, yielding an incidence of 0.42% for 18 months in the overall population aged at least 15 years, corresponding to an incidence of long-term glucocorticoid therapy of 2.8/1000 inhabitants/year. Among these incident cases, the most currently prescribed glucocorticoids were prednisolone (64%) and prednisone (32%). Sixty-three per cent of patients received only one type of glucocorticoid while 33% received two and 5% received 3 or more of them. The average treatment duration was 270.9 days (CI 95% 267.7 – 274). Most prescriptions (55,4%) were initiated by general practitioners. The median prednisone-equivalent dose was 11mg/day (IQR, 8.8–17.8) and varied very little with age and sex.
Rheumatoid arthritis was the most common disease associated with chronic glucocorticoid prescriptions in this cohort (30%), followed by chronic respiratory failure (21%), internal medicine diseases such as connectivite tissue diseases, polymyalgia rheumatica or Giant-cell arteritis (21%), asthma (15%) and infammatory bowel diseases like ulcerative colitis or Crohn's disease (13%).
Conclusions: Long-term corticosteroid therapy is frequent in France, its description is close to what is already known in Europe.

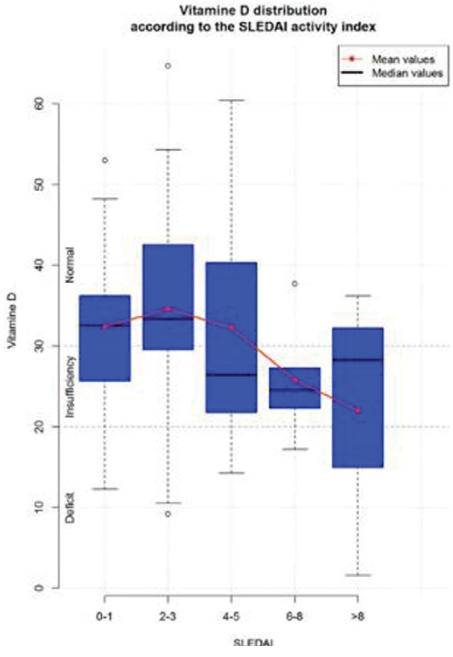
AB1142 VITAMIN D LEVELS AND ASSOCIATION WITH DISEASE ACTIVITY IN PARAGUAYAN SLE PATIENTS



L. Román[1], G. Avila Pedretti[1], M.E. Acosta[2], M. Melo[1], M.T. Martinez[1], D. Margarita[1], I. Acosta Colman[1]. *[1]Facultad de Medicina- UNA; [2]Producción, Instituto de Investigación en Ciencias de la Salud, Asunción, Paraguay*

Background: Systemic Lupus Erythematosus (SLE) is a systemic inflammatory disease associated with genetic, environmental, hormonal and immunological factors. Vitamin D levels are nowadays considered as one possible factor associated with disease activity. Therefore, previous studies have analyzed vitamin D to the severity of SLE.
Objectives: To assess the Vitamin D status in paraguayan SLE patients and its association with disease activity.
Methods: An observational Trial has been performed on individuals diagnosed with SLE. Epidemiological, clinical and biochemical data have been recorded for each patient to study the association between vitamin D concentrations, the phospho-calcium metabolism parameters and disease activity. Quantitative determination of Vitamin D was perform using chemoluminescence ARCHITEC assay. Vitamin D status was interpreted as follows: deficiency ≤20 ng/ml and insufficiency 21–29 ng/ml. The statistical association tests were performed using linear (SLEDAI activity index) and logistic (Inactive/Mild vs Moderate/Severe) regressions. The epidemiological, clinical and biochemical variables were used as explanatory variables in these models.This study is a preliminary analysis of a trial supported by CONACYT (Paraguay) to investigate the role of vitamin D in patients diagnosed with SLE.
Results: We included 77 SLE patients, of whom 94.8% (73/77) were female. The average age of patients at the time of the study was 30.7±10.3 years. All patients received calcium supplements associated with vitamin D. The average vitamin D concentration was 32.2±12.10 ng /ml. 29.9% (23/77) of patients had vitamin D insufficiency and 13.0% had vitamin D deficiency. 94.8% (73/77) of the population had normal serum calcium and the total population had a normal phosphoremia. As for the dosage of PTH, it was found that 27.3% (21/77) have high values of PTH. 20.8% (16/77) of the patients had positive anti-DNA. Low C3 complement was observed in 30/77 (39%) and low C4 in 50/77 (64.9%) patients.
The mean value of SLEDAI at the time of the study was 2.32±2.83. When we study the distribution of vitamin D concentration according to the disease activity (SLEDAI) a clear pattern is observed linking lower vitamin D concentrations with higher disease activity (Figure 1). Patients with lower vitamin D concentrations are more likely to have higher disease activity (OR 0.93, 95% CI 0.88–0.99;P-Value=0.059. The means and standard deviations of vitamin D depending on the SLEDAI activity index are provided in Table 1.

Table 1. Mean and standard deviation of each patient group according to the ranges of SLEDAI activity index

SLEDAI	Mean	Standard deviation
0–1	32.41	9.61
2–3	34.59	13.37
4–5	32.28	14.38
6–8	25.8	7.61
>8	22.03	18.13

Figure 1. Distribution of vitamin D depending on the SLEDAI activity index

Conclusions: In this preliminary study of Paraguayan SLE patients, Vitamin D deficiency was frequent despite treatment with supplements. In addition, a clear association between SLEDAI and Vitamin D values was observed. The final analysis in a larger patient cohort will have to confirm these findings and clarify relation with disease activity.

AB1143 THE IMPACT OF ANTI-CYCLIC CITRULLINATED PEPTIDE SEROPOSITIVITY ON EROSION PREVALENCE AMONG PATIENTS WITH RHEUMATOID ARTHRITIS OF VARYING DISEASE DURATION

L. Harrold[1], K. Price[2], H. Litman[3], S. Connolly[2], E. Alemao[2], S. Rebello[3], W. Hua[3], J. Kremer[4]. *[1]University of Massachusett, Worcester; [2]Bristol-Myers Squibb, Princeton; [3]Corrona, LLC, Southborough; [4]Albany Medical College and The Center for Rheumatology, Albany, United States*

Background: Little is known regarding the prevalence of erosive disease in a contemporary cohort of patients with RA and whether erosive disease prevalence differs by disease duration and seropositivity to anti-citrullinated protein antibodies (ACPA).
Objectives: To characterize the proportion of patients with RA with erosive disease by disease duration category and stratified by positive and negative serological status (anti-cyclic citrullinated peptide [anti-CCP], a surrogate for ACPA).
Methods: We identified patients with RA aged ≥18 years who were enrolled in the Corrona registry (October 2001–June 2016), with available disease duration, radiographic/MRI/ultrasound studies and serological status based on anti-CCP. Patients were grouped based on RA disease duration (0–2, 3–5, 6–10 and >10 years from diagnosis). Unadjusted prevalence erosion rates were calculated based on the proportion of patients with reports of erosions present on joint radiographs/MRIs/ultrasounds. Seropositivity was based on laboratory results (anti-CCP ≥20 U/mL) at enrolment in the Corrona registry. Chi-squared tests were used to assess differences in prevalence rates.
Results: There were 9759 patients who met inclusion criteria. Most were women (76%), middle-aged (mean [SD] 57 years [14]), with moderate disease activity (mean [SD] CDAI 14.7 [13.4]). Prior use of at least one biologic or targeted synthetic DMARD had occurred in 41% of patients. Overall, the prevalence of erosive disease was 28.6%, with higher prevalence among CCP+ (35.4%) vs CCP– (20.1%) patients ($p<0.001$, chi-squared test). The prevalence of erosions increased with increasing disease duration ($p<0.001$; Table). For each disease duration group, the prevalence of erosions was higher in patients who were CCP+ compared with those who were CCP–.

Table 1. Prevalence of Erosions According to Disease Duration and Serological Status

	Disease duration (years)			
	0–2	3–5	6–10	>10
Overall	19.3 (905/4699)	28.3 (475/1678)	33.4 (469/1404)	47.8 (946/1978)
Serological status				
CCP–	16.1 (359/2226)	22.7 (169/744)	21.8 (128/588)	28.1 (206/733)
CCP+	22.1 (546/2473)	32.8 (306/934)	41.8 (341/816)	59.4 (740/1245)

Data are % (n/N).

Conclusions: Erosions were common in this cohort of patients, and prevalence of erosions increased with longer disease duration. Patients who were CCP+ had higher rates of prevalent erosions than those who were CCP– with similar disease duration.

AB1144 GOOD THERAPEUTIC RESPONSE WITH BIOLOGICS: REMISSION IS REALITY. DATA FROM THE AUSTRIAN BIOREG REGISTRY

M. Herold[1,2], G. Eichbauer-Sturm[3], T. Nothnagl[4], R. Puchner[5], B. Rintelen[4], P. Spellitz[6], B.F. Leeb[4,7] on behalf of BioReg Austria. *[1]BioReg Austria, Vienna; [2]Department of Internal Medicine VI, Innsbruck Medical University, Innsbruck; [3]Rheumatologist in private practice, Linz; [4]2nd Department of Internal Medicine, Lower Austrian State Hospital, Stockerau; [5]Rheumatologist in private practice,*

Wels; [6]Rheumazentrum Wien-Oberlaa, Vienna; [7]Karl Landsteiner Institute of Clinical Rheumatology, Stockerau, Austria

Background: Remission or at last low disease activity is the aim of drug therapy in patients with chronic inflammatory rheumatic diseases. We evaluated disease activity in patients treated with biologics and using data of the Austrian biologic registry.
Objectives: The aim of this evaluation was to elucidate disease activity in patients with rheumatoid arthritis (RA), spondyloarthritis (SpA) and psoriatic arthritis (PsA) at baseline and at control-visits every six months after inclusion in BioReg.
Methods: Data were extracted from the Austrian BioReg registry (http://www.bioreg.at) which was initiated in 2009 to document patients treated with one of the biologics approved in Austria. Patients with ongoing biologic therapy as well as biologic-naïve patients starting biologic therapy can be included (baseline, BL). Further documentation is recommended about every six months (V1,V2 up to V11). Meanwhile, 1877 patients (rheumatoid arthritis (RA) n=1046, ankylosing spondylitis (SpA) n=446, psoriatic arthritis (PsA) n=322, other disease n=63) have been documented. Estimation of disease activity is done using DAS-28 as well as RADAI-5 in RA, SASPA in PsA, and BASDAI in SpA.
Results: DAS-28 (median values of BL; V1; V2; V9; V10) of patients with RA are 3,30; 2,51; 2,58; 2,52; 2,49, the respective RADAI-5 values are 3,2; 2,4; 2,2; 2.0; 2,3. BASDAI in patients with SpA were 3,60; 2,61; 2,45; 2,63; 2,20. Median values of inflammation's laboratory markers (ESR in mm/1st hour and CRP in mg/l) were always within the normal range (ESR and CRP in RA 15; 12; 12; 12,5; 14 and 2,0; 2,0; 2,0; 2,0; 2,0; in SpA: 8; 6; 7; 8; 8; and 2,0; 1,4; 1,4; 1,1; 1,0 in PsA 9; 8; 9; 7 (V7); 6 (V8); and 1,6; 1,5; 1,4; 1,9 (V7); 0,8 (V8)).
Conclusions: Our data confirm the efficiency of therapy with biologicals. During 5 years of continuous treatment more than half of patients with RA reach and keep remission with a DAS-28 below 2,6 and normal values of ESR and CRP. Also patients with SpA and PsA show similar successful therapeutic response.

AB1145 GENDER, AGE AND PULMONARY FUNCTION IN DOMINICAN PATIENTS WITH RHEUMATIC DISEASES

M.A. Santos [1], E. Tavera [2], C. Tineo [1], E. Loyo [1], J. Reyes [3]. *[1]Rheumatology, Hospital Regional Universitario Jose Maria Cabral y Baez; [2]Pneumologyst, Union Medica Clinic; [3]Investigation, Pontificia Universidad Catolica Madre y Maestra, Santiago, Dominican Republic*

Background: Interstitial lung disease (ILD) is a frequent entity in patients with rheumatic diseases, worsening the prognosis of those who suffer it (1). Previous studies have used the GAP (Gender, Age, Pulmonary function) model stage system to determine mortality at 1, 2 and 3 years (2). For stage I is 5.6% the first year, 10.9% second and 16.3% the third. GAP II has a mortality of 16.2%, 29.9% y 42.1% for the first, second and third year. For stage III, 39.2%, 62.1% and 76.8% respectively (3)
Objectives: To perform GAP model stage system in Dominican patients with Interstitial Lung Disease (ILD) related to Rheumatic Diseases (RD).
Methods: This is an observational, cross sectional study, with 42 patients who presented ILD related to RD. The GAP model stage system was determined by using demographic variables and pulmonary function tests such as spirometry and lung diffusion capacity (DLCO).
Results: 36 patients were female; the median age was 45±12 years. The mean value for Forced Vital Capacity (FVC) was 72%, Forced expiratory volume in 1 second (FEV1) 73%, and the ratio FEV1/FVC 99%. The DLCO mean value was 66±23 ml/min/mmHg. 35 patients (83.3%) were in stage I, 7 patients (16.6%) in stage II and none in stage III. The statistical significant variables were the time of diagnosis of the RD (p=0.013); with 4.9 years for those in stage I and 10.8 years for stage II; the time of the diagnosis of the ILD (p=0.003) with 2.1 years for patients in stage I and 4.8 years for stage II and smoking (p=0.063).
Conclusions: These findings suggest that the GAP model system is an useful tool to stage patients with interstitial lung disease related to rheumatic diseases. It can also help us make changes in treatment based on the stage. Special attention must be paid to those with a longer time of diagnosis of the RD, time of diagnosis of the ILD and/or smoking.

AB1146 PHARMACOLOGICAL APPROACH OF KNEE OSTEOARTHRITIS TREATMENT IN PRIMARY CARE IN SPAIN

M. Herrero Barbero [1], S. Gimenez [2], J. Vergara [3], E. Viles I Lladó [4], H. Martinez [4], G. Rodríguez Roca [5], L. Sánchez [1], J.A. Díaz Muñoz [6], J.F. Frias [7], A. Castaño [8], J.J. Jiménez Díaz [9], Á. Rodríguez de Cossío [10], R. Belenguer [11], J.L. Llisterri [12], J. Vergés Milano [1,13] on behalf of EMARTRO. *[1]Bioiberica, Barcelona; [2]Unidad de Gestión Clínica el Limonar, Malaga; [3]Centro de Salud Huercal, Almería; [4]Bioiberica S.A., Barcelona; [5]Centro de Salud la Puebla de Montalbán, Toledo; [6]Centro de Salud Ávila Rural, Ávila; [7]Hospital Universitario Virgen de las Nieves, Granada; [8]Centro de Salud Corella, Navarra; [9]Centro de Salud Los Cubos, Burgos; [10]Centro de Salud San Martin de la Vega, Madrid; [11]Centro de Salud Algemesí; [12]Centro de Salud Ingeniero Joaquín Belloch, Valencia; [13]Osteoarthritis Fundation International, Barcelona, Spain*

Background: Osteoarthritis (OA) is the most prevalent joint disease and the leading cause of disability from 60 years onwards. In fact, 14,8% of the Spanish population has OA.
Objectives: This study aimed to analyze the indications and average doses prescribed in the treatment of knee osteoarthritis in Primary Care in Spain.
Methods: The EMARTRO study was designed as an observational, multicenter, transversal study to compare probability of suffering a comorbidities based on presence of symptomatic knee OA visited by GPs. Sociodemographic, anthropometric, clinical parameters and clinical variables of interest were recorded. The prescribed medications and doses indicated in syntomatic knee OA were analyzed in patients included in the EMARTRO study.
Results: A total of 1173 patients were included, of whom 646 had knee OA. Patients with OA had a mean (SD) BMI of 30.9 (5.1), systolic blood pressure 132.8 (14.5) and diastolic blood pressure 77.9 (9.1) mm Hg. They also had a mean of 4.3 (1.9) comorbidities, the most frequent were hypertension 358 (62.2%), dyslipidemia 336 (58.3%), diabetes mellitus II 126 (21.9%), and gastroesophageal reflux 110 (19.1%). As for the symptomatology, the patients presented a mean (SD) pain in Huskisson's VAS of 65.18 (15.27) mm and algofunctional Lequesne score of 11.35 (4.86).
Patients were treated with a mean of 2,2 medications. The 45.5% of osteoarthritic patients were treated as monotherapy, 35.5% were taking 2 medications for osteoarthritis, 15.3% 3 and 3.7% 4 or more medications. It should be noted, taking into account the high levels of pain, that 15% of the patients did not receive any treatment.
Regarding prescribed medications for knee OA, 378 (58.2%) patients were treated with paracetamol at a mean daily dose (SD) of 1,150.5 (1,815.5) mg; 232 (35.9%) received NSAIDs, with metamizole being the most prescribed at doses 1,092 (538) mg, ibuprofen at doses 1,136 (528,8) mg and naproxen at doses 941,8 (238,5) mg. Next, 131 (20.3%) patients were treated with opioids, tramadol being the most frequent at doses 102.7 (49.7) mg; 87 (13.3%) with SYSADOA being chondroitin sulphate the most frequent at doses 758.7 (247.7) mg. Finally, 87 (13.3%) of the patients were treated with COX-2, mainly with etoricoxib at doses of 69.3 (27.1) mg.
Conclusions: Although the patients presented many concomitant pathologies, it is frequent to approach osteoarthritis in polytherapy. In addition, despite the high symptomatology, patients are treated primarily with a mild analgesic such as paracetamol at doses lower than those recommended. It is paradoxical the high prescription of NSAIDs in a population with a high prevalence of cardiovascular and gastrointestinal pathologies as well as an increase in the prescription of opioids.

AB1147 COMORBIDITY PROFILE IN MEN AND WOMEN AFFECTED BY SYNTOMATIC KNEE OSTEOARTHRITIS AND IMPACT OF GENDER IN THE SYMPTOMATOLOGY AND PERCEPTION OF HEALTH STATUS

M. Herrero Barbero [1], S. Gimenez [2], J. Vergara [3], E. Viles I Lladó [4], H. Martinez [4], G. Rodríguez Roca [5], L. Sánchez [1], J.A. Díaz Muñoz [6], J.F. Frias [7], A. Castaño [8], J.J. Jiménez Díaz [9], Á. Rodríguez de Cossío [10], R. Belenguer [11], J. Vergés Milano [1,12], J.L. Llisterri [13] on behalf of EMARTRO. *[1]Bioiberica, Barcelona; [2]Unidad de Gestión Clínica el Limonar, Malaga; [3]Centro de Salud Huercal, Almería; [4]Bioiberica S.A., Barcelona; [5]Centro de Salud la Puebla de Montalbán, Toledo; [6]Centro de Salud Ávila Rural, Ávila; [7]Hospital Universitario Virgen de las Nieves, Granada; [8]Centro de Salud Corella, Navarra; [9]Centro de Salud Los Cubos, Burgos; [10]Centro de Salud San Martin de la Vega, Madrid; [11]Centro de Salud Algemesí, Valencia; [12]Osteoarthritis Fundation International, Barcelona; [13]Centro de Salud Ingeniero Joaquín Belloch, Valencia, Spain*

Background: Osteoarthritis (OA) is the most prevalent joint disease and the leading cause of disability from 60 years onwards. In fact, 14,8% of the Spanish

population has OA. This study aimed to analyze the indications and average doses prescribed in the treatment of knee osteoarthritis in Primary Care in Spain.

Objectives: This study aimed to analyze the comorbidity profile of men and women affected by symptomatic knee OA and the differences between genders in the perception of health status with regard to pain and loss of function due to their OA, quality of life and mental health.

Methods: The EMARTRO study was designed as an observational, multicenter, transversal study to compare probability of suffering a comorbidities based on presence of symptomatic knee OA visited by GPs. Sociodemographic, anthropometric, clinical parameters and clinical variables of interest were recorded. The probability of suffering comorbidities based on presence OA was estimated using the Odds Ratio estimation with conditioned logistic regression models. Depending on the variable, comparisons between groups were done using t-Student, Chi-square and Mann-Whitney.

Results: A total of 646 patients were included, 71% were women. Mean (SD) age was 67.9 (6.6) years.

Patients were obese without gender differences, with a BMI of 30.4 (4.4) and 31.2 (5.5) (p=0.0651) in men and women, respectively.

Men had a mean (SD) systolic blood pressure higher than women, 134.7 (15.0) vs 132.2 (14.5) mmHg (p=0.0453) and no differences were observed in diastolic pressure (p=0.5930).

As regards to the concomitant pathologies, no increase was detected in the likelihood of suffering comorbidities linked to the gender [OR=0.607 (95% CI: 0.260–1.418) p=0.2490]. Men with OA were more likely to have angina pectoris [OR=4.493 (95% CI: 1.299–15.536) p=0.0176] and underwent coronary bypass [OR=3.706 (95% CI: 1.389–9.890) p=0089].

Osteoarthritic women elicited more pain in Huskisson's VAS 62.8 (14.7) vs 66.8 (15.4) mm (p=0.0027) and worse function according to the Lequesne index 10.0 (4.9) vs 12.1 (4.7) ($p<0.0001$).

In terms of quality of life according to the EuroQol, women presented worse quality of life in dimesion of mobility (p=0.0001) and in the dimensions of daily activities, pain/discomfort and anxiety/depression ($p<0.0001$).

Finally, regarding mental health status, women had worse scores in the Goldberg scale to detect psychological disorders ($p<0.0001$) and more cases of anxiety and depression according to the HAD scale ($p<0.0001$).

Conclusions: The results of the present study indicate that women with osteoarthritis of the knee, despite having the same diagnosis and a similar comorbidity profile to men, have a worse perception of health status regarding the symptoms of their osteoarthritis, their quality of life and their mental health.

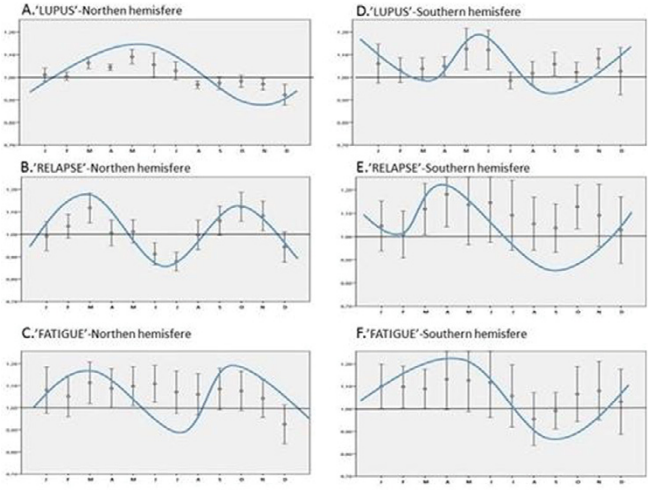
AB1148 INFODEMIOLOGY AND SEASONALITY OF SYSTEMIC LUPUS ERYTHEMATOUS USING GOOGLE TRENDS



M. Radin, S. Sciascia. *Department of Clinical and Biological Sciences, Center of Research of Immunopathology and Rare Diseases- Coordinating Center of Piemonte and Valle d'Aosta Network for Rare Diseases, Torino, Italy*

Background: People affected by chronic rheumatic conditions, such as systemic lupus erythematosus (SLE), frequently rely on Internet and search engines to look for terms related to their disease, and its possible causes, symptoms and treatments. "Infodemiology" and "infoveillance" are two recent terms created to describe a new developing approach for public health, based on Big Data monitoring and data mining[1]. Different clinical and epidemiological studies have been conducted on seasonality of SLE, and focused on flare, fatigue and periodicity of onset of clinical manifestations. Overall, SLE disease activity has been associated with specific seasonal patterns in both, Northern and Southern hemispheres, possibly in relation to sun exposure, meteorological factors and vitamin D levels[2,3].

Objectives: In this study, we aimed to investigate trends of Internet research linked to SLE and symptoms associated to the disease seasonality by applying a Big Data monitoring approach.

Methods: We analyzed the large amount of data generated by Google Trends, considering "lupus", "relapse" and "fatigue" in a 10-year web-based research. Google Trends automatically normalized data for the overall number of searches, and presented them as relative search volumes, in order to compare variations of different search terms across regions and periods. The Menn-Kendall test was used to evaluate the overall seasonal trend of each search term and possible correlation between search terms.

Results: We observed a seasonality for Google search volumes for lupus-related terms (Figure 1). In Northern hemisphere, relative search volumes for "lupus" were correlated with "relapse" (τ=0.85; p=0.019) and with fatigue (τ=0.82; p=0.003), whereas in Southern hemisphere we observed a significant correlation between "fatigue" and "relapse" (τ=0.85; p=0.018). Similarly, a significant correlation between "fatigue" and "relapse" (τ=0.70; $p<0.001$) was seen also in the Northern hemisphere.

Profile plots for relative search volumes. Profile plots show the relative search volumes for 'lupus' (A and D), 'relapse' (B and E) and 'fatigue' (C and F), in the Northern and Southern hemispheres, respectively, for different months of the year, with estimates sinusoidal curves.

Conclusions: Despite the intrinsic limitations of this approach, the current study provides additional evidence for seasonality of lupus by using Google Trends. Internet-acquired data might represent a real-time surveillance tool and an alert for healthcare systems in order to plan the most appropriate resources in specific moments with higher disease burden

AB1149 THE ABILITY OF THE HEALTH SYSTEM TO IDENTIFY THE BURDEN OF RHEUMATOID ARTHRITIS IN SERBIA: A EULAR SURVEY

M.I. Zlatkovic-Svenda[1], R.M. Stojanovic[1], S.B. Sipetic-Grujicic[2], M.M. Radak-Perovic[1], N.S. Damjanov[1], F. Guillemin[3]. *[1]Institute of Rheumatology University of Belgrade School of Medicine; [2]Institute of Epidemiology University of Belgrade School of Medicine, Belgrade, Serbia; [3]INSERM – Cic-Ec 1433, University Hospital, and Université de Lorraine, Ea 4360 Apemac, Nancy, France*

Objectives: to estimate the rheumatoid arthritis (RA) prevalence in two urban regions of Serbia, covering the northern and the southern part, under the European League Against Rheumatism (EULAR) prevalence survey; to assess the ability of the health system to recognize and treat patients with RA.

Methods: The survey was conducted in four Serbian towns: Belgrade in the north and three towns in the south: Cacak (Moravicki region), Uzice (Zlatiborski region) and Krusevac (Rasinski region), covering 36.5% of the total Serbian population with more than 99% Caucasians, mostly orthodox Serbs (83%), <4% Hungarians, Roms and Bosnians and a minority of other nationalities. The first-detection phase of the study comprised previously translated and validated telephone Questionnaire usage with 33 items covering signs, symptoms, self-reported diagnosis and classification criteria for RA (ACR 1987) (1). Diagnoses were confirmed by rheumatologists in a second-confirmation phase. Prevalence results were standardized for age and sex with regard to Serbian population (national census 2002). Confirmed RA cases were asked two more questions: "How long had you had symptoms before you were given the diagnosis of RA" and "How had you been treated for that period of time".

Results: 6213 people were contacted and 63.6% answered the survey; joint pain was reported by 1,799 persons, and joint pain accompanied with joint swelling by 606 persons. A total of 23 RA cases were identified; 2 newly diagnosed. The standardized RA prevalence estimates were 0.30% (95% confidence interval [95% CI] 0.09;0.51) for the north, e.g. 0.09 (95% CI 0.08;0.26) for men and 0.49% (95% CI 0.19;0.79) for women. RA prevalence estimates were 0.42% (0.12;0.72) for the south; 0.28 (0.00;0.56) for men and 0.55% (0.09;1.00) for women, with

the female to male ratio 5,5:1 in the north and 2:1 in the south. Time period from the first symptoms occurence to the RA diagnosis was 17.7 (13.2) months for the northern part and 25.0 (16.9) for the southern; 20.6 (14.9) for Serbia; in that period patients were mostly treated with NSAIDS (82%) and physical therapy (30%); short-lasting corticosteroids were given to 13%, peroral corticosteroids to 4% and no patients were treated with DMARDS.

Conclusions: RA prevalence in the southern and northern part of Serbia is in line (0.42% [95% CI 0.12;0.72]) vs 0.30% [95% CI 0.09;0.51]), being more frequently presented in females as compared to males (five times more in the north and two times more in the south). Delay in diagnosis as compared to the first symptoms occurence was 21 months and during that time no patients were treated with DMARDS.

AB1150 SLEEP HEALTH AND QUALITY OF LIFE IN PATIENTS WITH KNEE OSTEOARTHRITIS BEFORE AND AFTER TOTAL KNEE REPLACEMENT

M. Nuñez[1], E. Nuñez[2], J.M. Segur[3], L. Lozano[3], J. Montañana[3], V. Segura[3], M. Marti[4], A. Garcia-Cardó[4], S. Sastre[3], X. Alemany[3]. *[1]Rheumatology and IDIBAPS Area 1, Hospital Clinic; [2]SAP Suport al Diagnòstic i al Tractament, Institut Català de la Salut; [3]Orthopedic Surgery and IDIBAPS; [4]Rheumatology, Hospital Clinic, Barcelona, Spain*

Background: Studies report that sleep disturbances are often associated with chronic musculoskeletal disease. There is no agreed definition of sleep health, but some characteristics, such as sleep duration (number of hours daily) and sleep quality or satisfaction (subjective evaluation of good or poor sleep) are used to evaluate sleep health. In a previous study in patients with severe osteoarthritis awaiting total knee replacement (TKR), patients reporting good quality sleep had better health-related quality of life (HRQL) measured by the specific WOMAC and generic SF-36 questionnaires.

Objectives: To measure sleep health in patients included on a waiting list for TKR and 12 months after TKR.

Methods: Prospective study with a 12-month follow up. Sociodemographic and clinical variables were determined. Sleep health: hours of sleep and reparative sleep (RS) were examined using the question "How well do you usually sleep?" measured on a Likert scale (1=good [RS], 2=regular, 3=badly, 4=with medication/treatment (non-reparative sleep [NRS]). Function and pain were measured using the WOMAC and SF-36 questionnaires. Comparisons were made using t-tests (paired samples) and McNemar's test. Linear regression models were used to analyze associations. Dependent variables: WOMAC and SF-36 pain and function dimensions; independent variables: sleep quality, age, sex, BMI, number of comorbidities, depression/anxiety.

Results: 105 patients (79% female, mean age 69.39 years [SD 8.3]) were included. 80% had $\geq$2 comorbidities (mean 2.71 [SD 1.8]), mean BMI was 33.68 (SD 6.7), 32 had depression/anxiety, and mean sleep duration was 6.63 hours (SD 1.4). 12 months after TKF there were significant improvements in WOMAC dimension scores (mean $>$25 points, $p<0.001$) and SF-36 scores (mean $>$19). At study inclusion, 23% reported RS with a mean sleep duration of 7.5 hours (SD 1.1) vs. 6.24 hours (SD 1.5) in NRS patients (p=0.002). 12 months after TKR, 40% of patients had RS (p=0.029). Patients with RS had better scores in all quality of life dimensions ($<$10 points) than those with NRS ($p<0.05$) at baseline and at 12 months. Multivariate analysis showed RS was independently associated with pain and function (WOMAC and SF-36) ($p<0.007$).

Conclusions: Sleep health was associated with better HRQL before and after TKR. Although more patients had RS after TKR, 60% of patients continued not to have sleep health. Although often undervalued clinically, sleep health is closely associated with the health status.

Acknowledgements: This work was funded by project PI/13/00948, integrated in the Plan Nacional I+D+I and cofounded by ISCIII-Subdirección General de Evaluación and European Regional Development Fund (ERDF).

AB1151 MONTH OF BIRTH AFFECTS THE RISK OF RHEUMATIC DISEASES: A NATIONWIDE CASE-CONTROL STUDY

N. Koo, J. Lee, B.W. Lee, S.-K. Kwok, S.H. Park, J.H. Ju. *Division of Rheumatology, Department of Internal Medicine, School of Medicine, The Catholic University of Korea, Seoul St. Mary's Hospital, Seoul, Korea, Republic Of*

Background: There have been several studies which demonstrated the impact of birth on the risk of certain diseases such as asthma or cardiovascular diseases. However, rheumatic diseases have not yet been thoroughly investigated in terms of association with birth month.

Objectives: In this study, we sought to determine whether birth month or season could affect the risk of rheumatologic diseases.

Methods: The birth month patterns of patients with rheumatic diseases were compared with to those of general population. We utilized the claims data of Health Insurance Review and Assessment Service (HIRA) which covers nearly 90% of total population in Korea. The associations between birth month/season and 32 diseases were investigated using logistic regression.

Results: Our dataset included 17,247,458 (male 8,224,670; female 9,022,788) individuals from HIRA database from January, 1997 to August, 2015. Among 27 rheumatic diseases, 8 diseases including Crohn's disease (CD), ulcerative colitis (UC), rheumatoid arthritis (RA), systemic lupus erythematosus, polymyalgia rheumatica (PMR), ankylosing spondylitis (AS), multiple sclerosis, gout, fibromyalgia (FMS) were significantly associated with birth month ($P<0.05$). In terms of seasonality, CD, UC, RA, Sjogren's syndrome, PMR, AS, Gout, and FMS demonstrated significant difference. CD, UC and AS showed higher prevalence in individuals born in winter and lower prevalence in summer. On the other hand, people who were born in summer showed higher possibility to have gout and FMS compared to those born in winter. In consistent with previous reports, type 1 diabetes is more prevalent in those born in winter. Angina and myocardial infarction showed higher prevalence in patients born in spring and lower in fall. This consistency reflects the relevance of our dataset and methodology.

Conclusions: We found significant impacts of birth month/season on various rheumatic diseases. Seasonal variation of infective agents, sun exposure or food ingestion during gestation or early infancy may explain the association between birth month/season and certain disease development.

AB1152 THE INCIDENCE OF HYPERSENSITIVITY TO NSAIDS IN THE GROUP OF PATIENTS WITH MUSCULOSKELETAL DISORDERS

O. Brzezińska-Pawłowska[1], A. Sztanka[2], K. Słodkowski[2], A. Lewandowska-Polak[2], J. Makowska[2]. *[1]Department of Rheumatology, Immunology and Allergy; [2]Department of Rheumatology, Medical Univercity of Lodz, Łódź, Poland*

Background: Non-steroidal anti-inflammatory drugs (NSAIDs) are among the most common cause of drug hypersensitivity reactions (DHR). Recent studies show that the prevalence of hypersensitivity reaction to drug is particularly in Poland.

Objectives: To assess the frequency and the risk od developing NSAID hypersensitivity in patients with chronic disorders of the musculoskeletal system.

Methods: The study group consisted of 200 patients (age 19–88 years - 54,5±14, women-161, men-39) hospitalized in the Department of Rheumatology in 2015–2016. All patients filled questionnaire regarding symptoms of DHR after ingestion of non-steroidal anti-inflammatory drugs. The presence of DHR, clinical pattern of the reaction, frequency of NSAIDs administration and comorbidities have been studied. In statistical studies the main risk factors were defined.

Results: Seventy-seven patients from study group (38,5%) reported symptoms that occurred within 24 hours after NSAIDs ingestion. Symptoms characteristic for hypersensitivity reaction were reported by 40 patients (20%). Respiratory symptoms like dyspnea and/or cough were reported by 22 patients (11%). Cutaneous symptoms (urticaria/angioedema/dermal flush) were reported also by 29 patients (14,5%). Three patients experienced loss of consciousness. Thirty-seven patients reported isolated stomach cramps.

The symptoms developed usually between 2–12 hours after drug intake. In 37 patients oral administration caused DHR reaction, moreover in 14 patients also topical application led to adverse reaction. In most of patients reaction appeared due to COX-1 inhibitor and interestingly in 3 patients reaction was evoked by celecoxib which is perceived to be safe alternative for patients with NSAIDs hypersensitivity. Chronic urticaria, asthma and systematic drug intake occurs the main risk factors of hypersensitivity.

Conclusions: Drug hypersensitivity reactions are reported very frequently in population of patients with chronic musculoskeletal disorders. Our studies suggest that patients taking protractedly NSAIDs are in group with high risk of drug hypersensitivity development.

AB1153 OSTEOPOROSIS RISK FACTORS IN PARTICIPANTS OF HEALTHY AGING ACADEMY

O. Brzezińska-Pawłowska[1], A. Łuczak[2], D. Stalmach[2], A. Lentas[2], M.L. Kowalski[1], J. Makowska[2]. *[1]Department of Immunology, Rheumatology and Allergy; [2]Department of Rheumatology, Medical Univercity of Lodz, Łódź, Poland*

Background: Osteoporosis is a major cause of morbidity and mortality in elderly population. It is known that the mortality rate in European population within 1 year of hip fracture is about 30%, and another 30% of patients need long term nursing for the rest of their life. However, the prevalence and associated risk factors in the Polish elderly population have not been well documented. The aim of the

study was to assess prevalence of osteoporosis in Polish elderly population and to assess risk factors related to osteoporotic fractures
Objectives: The study was based on questionnaires distributed among 645 students (61 men, 533 women and 51 not report mean age 69,42±5,88) attending the Healthy Aging Academy at Medical University.
Methods: Students were asked to answer 20 questions including information about endured fractures, osteoporosis risk factors, screening densitometry, treatment of osteoporosis, supplementation with vitamin D3 and calcium. Also, questions about classical risk factors for osteoporosis (loss of height (5 cm/year), family history, falls, loss of weight, treatment with steroids) were included to questionnaire.
Results: Fractures caused by fall from their own height were reported by 180 (27,91%). Moreover, 96 (14,88%) responders without fracture history declared more than 3cm decrease of height after their forties, what strongly suggest osteoporotic vertebral fractures. Forty three (24%) of the respondents had multiple fractures and single fractures were reported by 137 (76%) respondents. The most common localization of fractures was forearm (57%), shin bones (10,4%) and foot bones (9%). Among subjects who underwent densitometry after the fracture 32% had the diagnosis of osteopenia; 19,4% were diagnosed with osteoporosis and in 23,1% bone density was within normal limits. The strongest risk factors for osteoporotic fractures were numerous falls per year (p=0,000) and frequent drinking of alcohol (p=0,008). The risk factors of fractures (sum of risk factors for falls and osteoporosis) among people with previous fractures vs. those without fractures were statistically significant (p=0,037). Only 13% of patient with fracture and 15% of all patients with osteoporosis and osteopenia were treated by antiosteoporotic drugs (ibandronian/aledronian). Calcium supplementation was received by 30% of patients with fracture and 43% supplemented vitamin D3.
Conclusions: The prevalence of osteoporotic fractures in population of relatively well educated population of participants of Third Age University seems to be high. Patients with osteoporosis do not receive appropriate pharmacological prophylactic treatment, pointing at the need for education of primary care physicians and elderly population about burden and consequences of osteoporosis.

AB1154 CHARACTERIZATION OF CHILEAN PATIENTS WITH PULMONARY DISEASE ASSOCIATED TO A RHEUMATOLOGIC DIAGNOSIS IN AN INTEGRATED POLYCLINIC. HOSPITAL PADRE HURTADO EXPERIENCE

O. Valenzuela[1], V. Agar[1], J.P. Leiva[2], I. Allende[2], G. Bozzano[2], G. Miranda[3], S.E. Ibáñez Vodnizza[1]. *[1]Rheumatology department, Clinica Alemana de Santiago/Hospital Padre Hurtado; [2]Facultad de Medicina Clinica Alemana de Santiago - Universidad del Desarrollo; [3]Hospital Padre Hurtado, Santiago, RM, Chile*

Background: Pulmonary diseases associated to a rheumatologic condition constitute a heterogeneous group of pathologies that are grouped according to their clinical and radiological similarity. There is a perception that the incidence of these diseases has been increasing, however, in Chile, there are no up-to-date publications regarding the characteristics of this group of patients.
Objectives: To describe and characterize patients with pulmonary disease associated to a rheumatologic diagnosis at Hospital Padre Hurtado, Chile, between the years 2014 and 2016.
Methods: Patients with suspected lung involvement associated to a connective tissue disease were evaluated by a bronchopulmonar specialist and a rheumatologist in a joint polyclinic. If the diagnosis was confirmed by the specialist the patient was included in the database. Data collected included age, gender, rheumatologic diagnosis and radiological pattern.
Results: 76 patients were included. 85.5% were female. The mean age was 58 years. Eighty-nine percent of the patients came from the Rheumatology department. These patients developed respiratory symptoms during the course of their disease. The remaining 11% were patients controlled in the Pulmonary diseases department, and the respiratory symptoms were the first manifestation of their conective tissue disease.The rheumatologic diagnoses that were concluded in this multidisciplinary polyclinic were distributed as described in Table 1.
69.7% of the patients have completed the radiological evaluation (Table 2).
Conclusions: Having a multidisciplinary clinical unit allowed us to order and protocolize the study, follow-up and treatment of the patients with lung involvement associated with a connective tissue disease. Currently, the multidisciplinary management of these patients is indispensable, as described in the literature.

Tracheal stenosis (%)	1 (1.9)

AB1155 DEPRESSION AND SUICIDALITY ARE COMMON IN PSORIATIC ARTHRITIS AND AXIAL SPONDYLOARTHRITIS, AND RATES ARE COMPARABLE TO THOSE IN PSORIASIS

A. Sheahan[1], R. Suruki[1], P.C. Taylor[2], V.S. Sloan[1]. *[1]UCB Pharma, Raleigh, United States; [2]Kennedy Institute, Oxford, United Kingdom*

Background: Depression and suicidality are well-described comorbidities in psoriasis (PSO). The prevalence of these comorbidities in psoriatic arthritis (PsA) and axial spondyloarthritis (axSpA) is less well described.
Objectives: To assess the prevalence of depression and suicidality in PsA and axSpA in the recent literature, and compare rates to PSO.
Methods: For PsA and axSpA, we evaluated the recent English-language literature identified through a PubMed search; we used a recent review and performed a targeted review of the period since the publication in order to establish the rates for PSO for comparison.[1] Review articles were also examined to identify key publications.
Results: Rates of depression in PSO vary widely, depending on the outcome definition and method of ascertainment. Dowlatshahi et al. reported a pooled rate of 9.0–55.0%, with rates from the literature after the review period ranging from 9.0–39.8%. Rates for suicidality also varied widely, with 2.5–17.3% of patients (pts) reporting suicidal ideation. The limited data available provide ranges for depression in PsA of 3.4–28.6%, and in axSpA of 3.1–44.0%. The single study that differentiated between ankylosing spondylitis (AS) and non-radiographic (nr)-axSpA did not identify a difference between the two groups.[2] Very limited data existed on suicidality in PsA and axSpA. For PsA, the incidence rates (IR) of suicidal ideation, attempts, and suicide per 1000 person-years in the UK were 0.4, 1.3, and <0.001, respectively;[3] no prevalence data were identified. In a study in China, 2.5% of pts with axSpA reported a past suicide attempt,[4] while a study in Turkey found 9.6% of pts with AS had thoughts of suicide in the past year, but without plans.[5] Depending on the study, different definitions and tools were used to assess depression (eg. HADS, ICD9, antidepressant use), and even when the same tool was used, different cutoffs for defining depression were implemented (eg. cutoff for HADS ranged from $\geq$5 to $\geq$11), making comparisons across studies difficult. In a large observational study of AS with matched controls, the IR of depression per 1000 pt-years was 5.48 in AS versus 3.29 without AS, risk ratio 1.63.[6]
Conclusions: Although data are limited, rates of depression and suicidality in PsA and axSpA are comparable to those in PSO. Comparisons between studies and diseases are challenging due to a lack of standardized assessment tools and definitions of depression and suicidality. There are almost no data for nr-axSpA, which unlike AS has no gender predominance. Given that depression in PSO pts is more common in women,[7] understanding the relative prevalence in AS versus nr-axSpA would be important. Generating additional data regarding the impact of depression and suicidality in PsA and axSpA should increase awareness among treating physicians.

AB1156 THE DESCRIPTIVE EPIDEMIOLOGY OF CUTANEOUS LUPUS ERYTHEMATOSUS IN THREE LARGE U.S. ADMINISTRATIVE DATABASES, 2010-2014

S.A. Hall[1], L. Li[2], S. Eaton[2], C. Musselli[2], A. Dilley[1]. *[1]Epidemiology; [2]Biogen, Cambridge, United States*

Background: Previous epidemiologic studies of cutaneous lupus erythematosus (CLE) have not described the pediatric burden, and have focused on specific geographic areas, limiting generalizability.
Objectives: To describe the demographics, comorbid conditions and pharmacy drug utilization of CLE patients, 3 large sources of U.S. administrative claims

data: 1) commercial insurance, 2) Medicaid insurance, and 3) Medicare insurance were utilized.
Methods: The data source was Truven Health MarketScan® Databases, containing medical service and prescription drug claims from commercial, Medicaid (11 states) and Medicare supplemental insurance plans for >80M US patients. CLE cases were identified by presence of ≥2 service dates with an ICD-9 code 695.4 on unique dates ≥28 days apart during the study period (Jan 1 2010-Dec 31 2014). For the most recent study year, the 5 most frequent comorbidity categories were reported using Clinical Classifications Software (CCS) Level 2 groupings. Similarly, the 5 most frequent pharmacy dispensings among CLE cases in 2014 were reported.
Results: In the Commercial, Medicaid, and Medicare claims data, 35,781, 7,361 and 5,594 CLE patients, respectively, were identified. CLE cases were >80% female with <6% aged <19 (Table). The most frequent CCS category (in all databases except Medicare) was CCS 13.7 (SLE and connective tissue disorders including systemic sclerosis, sicca syndrome, dermatomyositis, and polymyositis) where 63.1%, 76.6%, and 59.4% of CLE cases in the Commercial/Medicaid/Medicare data, respectively, had ≥1 claim. The most frequently-dispensed medication was corticosteroid hormone (62.5%, 72.1%, and 62.3% in the Commercial/Medicaid/Medicare data), while antimalarials were used by 58.3%, 55.9%, and 52.1% of CLE patients in the 3 databases, respectively.

Table 1. Demographics of CLE patients, by database, 2010–2014

	Commercial	Medicaid	Medicare
N	35,781	7,361	5,594
Mean (Median) Age	46.6 (49)	44.1 (44)	71.9 (71)
Age category			
≤18	2.2%	5.3%	0.0%
19–30	9.1%	15.1%	0.0%
31–45	29.5%	32.3%	0.1%
46–60	47.9%	33.1%	2.5%
61–64	10.7%	5.4%	1.9%
65+	0.7%	8.8%	95.5%
% Female	84.8%	89.7%	81.2%

Conclusions: Our results document a low relative burden of pediatric CLE. Notably, 23 to 41% of CLE patients did not have a claim for SLE or other connective tissue disease. Limitations include the inability of code 695.4 to distinguish between CLE subtypes, including discoid and subacute cutaneous lupus.

AB1157 PREVALENCE OF MUSCULOSKELETAL DISORDERS AMONG GARMENT INDUSTRY WORKERS IN BANGLADESH

S.A. Haq, N. Shazzad, S. Ahmed, A.Z. Al-Qadir, A. Shahin. *Rheumatology, Bangabandhu Sheikh Mujib Medical University, Dhaka, Bangladesh*

Background: Garments industry is flourishing in many developing countries. Attention is often not paid to ergonomics. It is plausible that the prevalence of musculoskeletal (MSK) pain may be high among garments workers.
Objectives: To estimate the prevalence of symptoms and disorders (MSD) among garment workers in Bangladesh.
Methods: This cross sectional study was carried out among 350 workers in two garment factories by face-to-face interview. The COPCORD (Community Oriented Program for Control of Rheumatic Disorders) methodology was adopted for the survey.The workers were classified into cutting, sewing, finishing and quality control operators. Trained interviewers identified subjects with musculoskeletal pain. Trained internists and rheumatologists examined the positive respondents.
Results: The point prevalence of musculoskeletal pain was 61.71%. The parts commonly affected during the preceding 7 days of interview in the whole group were shoulder (17.9%), lower back (15.2%), neck (13.8%) and knee (10.8%). The cutting operators suffered more from back (15.4%), neck (15.4%) and lower limb (11.5%); sewing operators from lower limb (12.4%), back (8.5%) and upper limb (7.7%); finishing operators from lower limb (50%) and quality control group from back pain (50%). Multiple regional pains were more frequent (n=155) among all operators.The sewing and cutting operators suffered from multiple regional pains more than other operators.The prevalence of Rheumatoid arthritis (RA) 0.9%, spondyloarthropathy (SpA) 1.42%, undifferentiated arthritis (UA) 1.1%, nonspecific low back pain (NSLBP) 4.6%, soft tissue rheumatism (STR) 3.7%, osteoarthritis (OA) 0.9% and lumbarspondylosis 1.1%.Nonspecific pain was the commonest condition (63.71%).
Conclusions: Rheumatic disorders are common causes of morbidity, disability, and work loss among the garment workers of Bangladesh where male and female workers are almost equally affected. Multiple regional involvementsare common in this occupational group. Mechanical disorders are the commonest.

AB1158 PREVALENCE OF COMORBIDITIES IN PSORIATIC ARTHRITIS: A CROSS-SECTIONAL STUDY

T. Gudu, A. Peltea, M. Abobului, A. Balanescu, F. Berghea, V. Bojinca, A. Borangiu, C. Constantinescu, L. Groseanu, M.M. Negru, D. Opris-Belinski, D. Predeteanu, I. Saulescu, V. Vlad, R. Ionescu. *Rheumatology, Sf Maria Hospital, UMF Carol Davila, Bucharest, Bucharest, Romania*

Background: Psoriatic arthritis (PsA) is associated with important comorbidities: cardiovascular, gastro-intestinal, infectious, malignant, and psychiatric [1, 2]. However, they are less studied in PsA compared to other chronic inflammatory arthritis.
Objectives: The objective of this study was to calculate the prevalence of comorbidities and risk factors in a cohort of PsA patients.
Methods: This was an observational cross-sectional study, including consecutive, unselected adult patients, with a diagnosis of PsA according to their rheumatologist. Data collected: demographical, clinical (affected joints, current psoriasis, axial involvement, enthesitis, dactylitis), biological (acute phase reactants), and treatment related (nonsteroidal anti-inflammatory drugs, synthetic remissive drugs and biologics). Data on comorbidities and risk factors were collected according to the European League Against Rheumatism (EULAR) recommendations on reporting comorbidities in chronic inflammatory rheumatic diseases in daily practice [3].
Results: In all, 129 PsA patients were included: 77 (59.7%) women, mean age ± standard deviation 53.5±11.8 years, disease duration 7±7.4 years; 53 (41.1%) had axial involvement, 33 (25.6%) dactylitis, 18 (14%) enthesitis, and 24 (18.6%) current moderate/severe psoriasis. Most of them had low or moderate disease activity and almost a quarter of them (32; 24.8%) were taking a biologic.
The most prevalent comorbidities were: dyslipidaemia 103 patients (79.8%), hypertension 67 (51.9%), obesity 44 (34.1%), diabetes 21 (16.3%) and ischemic heart disease 15 (11.6%). Almost a third of patients (42, 32.6%) suffered a cardiovascular event after their PsA diagnosis, of which heart attack 2 patients, stroke 4, cardiac failure 4 and peripheral arterial disease one patient. Cardiovascular events correlated with smoking (r=0.893, p<0.001) and current moderate/severe psoriasis (r=0.218, p=0.013).
Regarding infectious comorbidities: 11 patients (8.5%) had a history of tuberculosis after being diagnosed with PsA, 7 (5.4%) chronic viral hepatitis, of which 4 with B virus and 3 with C virus, and 5 patients (3.9%) developed severe infections. Five patients (3.9%) were diagnosed with neoplasia, but no correlation was identified with any of the clinical, biological or treatment related included variables. Only 11 patients (8.5%) were diagnosed with depression, but the prevalence is probably underestimated, since not all patients were screened to this end.
Conclusions: PsA is associated with a high prevalence of comorbidities, especially cardiovascular diseases. This should be taken into consideration in the therapeutic and the global management of PsA patients.

AB1159 HIGH DOSE GLUCOCORTICOIDS AS A RISK FACTOR OF SIGMOID DIVERTICULITIS PERFORATIONS IN AUTOIMMUNE DISEASES

T. Kuranobu, M. Ishitoku, T. Tokunaga, Y. Yoshida, S. Hirata, T. Nojima, E. Sugiyama. *Department Clinical Immunology and Rheumatology, Hiroshima university hospital, Hiroshima, Japan*

Background: It has been reported that glucocorticoids (GCs) and non-steroidal anti-inflammatory drugs (NSAIDs) might increase sigmoid diverticulitis perforations (SDPs) for rheumatoid arthritis patients, however, there are few previous reports referring to the relationship between SDPs and GCs in patients with systemic autoimmune diseases. We investigate relationship between SDPs and GCs in patients used GCs for not only rheumatic patients but also other autoimmune disease' sufferer.
SDPs and GCs
Objectives: To describe development of SDPs during high dose GC (over PSL 0.8mg/kg equivalent) therapy for systemic autoimmune diseases in our department, additionally reviewing previous reports with regard to the relationship between SDPs and GCs.
Methods: 187 patients hospitalized in our department from April 2015 to December 2016 were retrospectively reviewed.
Results: Among 187 patients, 61 took high dose GCs, 29 took moderate dose GCs (0.5–0.6mg/kg PSL equivalent), 53 took low dose (less than 0.5mg/kg PSL equivalent), and 29 didn't take GCs. Four patients out of 61 who took high dose GCs developed SDPs (table). Nobody developed SDPs in moderate, low and

not any dose GCs group. Case 1–3 took NSAIDs. Case 2 received mPSL pulse therapy (mPSL 1 g x 3 days). Case 1 and 2 developed SDPs within 3 months from initiating GCs. Case 1 recurred SDPs at 17 and 63 months from initiating GCs. Case 2 was prescribed Tacrolimus as a concurrent medication. All four patients were operated to remove the perforated segment, and case 2 and 4 were created artificial anus. Although they were clinically diagnosed as SDPs only case 4 clarified perforation in pathological findings.

case	age sex	target	age at onset (year)	period from GCs start to onset (mo)	maximum doses of GCs (mg)	doses at onset (mg)	cumulative doses of GCs (mg)
1	76 female	Dermatomyositis	70	3	60	32.5	2.5
2	72 male	Polymyositis	70	2	60	19	6
3	74 female	Rheumatoid vasculitis	74	94	50	9	30
4	73 male	Psoriatic arthritis	71	103	40	10	25

table – patients characteristics and GCs profile

Conclusions: We should take care of developing SDPs in patients described high dose GCs.

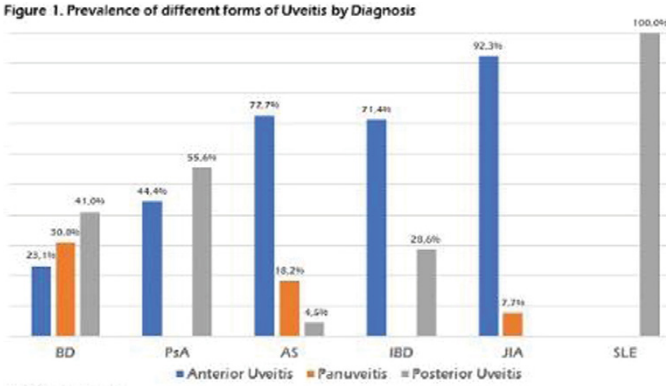
AB1160 EPIDEMIOLOGY AND CLINICAL PRESENTATION OF OCULAR INVOLVEMENT IN A POPULATION OF 278 PATIENTS WITH NON INFECTIOUS UVEITIS

V. Venerito[1], G. Lopalco[1], L. Cantarini[2], C. Fabiani[3], M. Fornaro[1], A. Vitale[2], S. Guerriero[4], R. Favale[4], M. Giannini[1], M. Nivuori[1], F. Cacciapaglia[1], G. Laselva[1], M. Galeazzi[2], G. Lapadula[1], F. Iannone[1]. *[1]Department of Emergency and Organ Transplantations, Rheumatology Unit, University of Bari "Aldo Moro", Bari; [2]Interdepartmental Research Center of Systemic Autoimmune and Autoinflammatory Diseases, Rheumatology Unit, Policlinico le Scotte, University of Siena, Siena; [3]Department of Ophthalmology, Humanitas Clinical and Research Hospital, Rozzano; [4]Department of Basic Medical Sciences, Neuroscience and Sense Organs, Ophthalmology Unit, University of Bari "Aldo Moro", Bari, Italy*



Background: Uveitis is a sight-threatening inflammation which may involve different anatomic parts inside the eye. Rheumatologists should be aware of the ocular clinical signs and of the frequency of uveitis because it may cause irreversible lesions to the eye that predominantly affect people in their most productive years, being one of the most common extra-articular manifestation in several rheumatic diseases.

Objectives: We aimed to describe the presentation of the clinical features of ocular involvement in a population of patients affected with newly diagnosed Non Infectious Uveitis (NIU).

Methods: 278 patients (mean age 42±18,18 years, range 4 - 87) from three specialized centres, all affected with uveitides, were enrolled; 158 were female, 120 male, all caucasian but one asiatic. Complete ophtalmologic examination was carried out in all of them, malignancy or infections of any kind were preventively ruled out. In addition blood tests, serum antibodies level evaluation and HLA haplotype typization were performed. Moreover instrumental tests were performed when a relation with systemic diseases was suspected. Uveitides were then classified according to the Standardization of Uveitis Nomenclature Working Group Criteria.

Results: 149 (53,6%) patients were affected with Anterior Uveitis (AU), 45 (16,2%) with Panuveitis, 16 (5,8%) with Intermediate Uveitis (IU) and 68 (24,5%) with Posterior Uveitis (PU). 110 (41,7%) patients were known to have a systemic disease at the moment of the uveitis onset. HLA-B27 positivity was found in 15,8% of patients, whereas HLA-B51 positivity was found in 21,9% of patients. Behçet's Disease (BD) was diagnosed in 39 (14%) patients: in particular AU was found in 9 out of 39 patients (23,1%), while PU in 16 out of 39 patients (41%). Ankylosing Spondylitis (AS) was recognized in 22 (7,9%) patients: AU was diagnosed in 16 out of 22 (72,7%) of them while 4 out of 22 (18,2%) where affected with Panuveitis. The cases of Psoriatic Arthritis (PsA) were 9 (3,2%); specifically, AU was recognized in 4 out of 9 (44,4%) of them while PU was found in 5 out of 9 (55,6%) of them. We also defined the most common form of uveitis in patients affected with either Juvenile Idiopathic Arthritis, or Systemic Lupus Erythematosus, or Sarcoidosis, or Vogt-Koyanagi-Harada disease or Inflammatory Bowel Diseases. The idiopathic form of uveitis, was diagnosed in 162 (58,3%) patients. Anti-nuclear antibodies (ANA) levels were assessed in 148 patients of whom 57 (38,5%) have been found ANA positive and 91 (61,5%) ANA negative. Notably 38 (66,7%) ANA positive patients were affected with AU.

Figure 1. Prevalence of different forms of Uveitis by Diagnosis

BD: Behçet's Disease
PsA: Psoriatic Arthritis
AS: Ankylosing Spondylitis
IBD: Inflammatory Bowel Diseases
JIA: Juvenile Idiopathic Arthritis
SLE: Systemic Lupus Erythematosus

Conclusions: Our study provides a depiction of clinical features and epidemiology of ocular involvement in a huge population of patients presenting newly diagnosed NIU. Notably, in our population, idiopathic uveitis was the most commonly diagnosed form; it took shape of AU in 56,6% of cases. The majority of HLA-B27 positive uveitides were also AU (68,2%), while, among HLA-B51 uveitides, PU (39,3%) and AU (37,7%) were recognized as the most common presentations.

Validation of outcome measures and biomarkers

AB1161 PORTUGUESE ADAPTATION AND VALIDATION OF THE ANKYLOSING SPONDYLITIS QUALITY OF LIFE (ASQOL) QUESTIONNAIRE

A. Águeda[1], A. Heaney[2], S.P. McKenna[2], A. Barcelos[1]. *[1]Rheumatology, Centro Hospitalar do Baixo Vouga, E.P.E., Aveiro, Portugal; [2]Galen Research Ltd., Manchester, United Kingdom*

Background: Ankylosing Spondylitis (AS) is a chronic rheumatic disease that affects mainly the axial skeleton and entheses. If left untreated, AS evolves with limited spine mobility and irreversible structural changes, with severe repercussions in patients' quality of life. Throughout the years many instruments have been used in order to evaluate AS impact in patients' lives, focusing predominantly on symptoms and functioning however, these instruments do not inform on the impact of the condition on quality of life (QoL). The ASQoL is a patient reported outcome measure, specifically developed to evaluate QoL in AS patients. It has been adapted to several languages worldwide, though a Portuguese version hadn't been developed yet.

Objectives: Translation of the ASQoL questionnaire into Portuguese and ascertain its psychometric properties.

Methods: Translation of the original UK English ASQoL into Portuguese was performed by bilingual panel and then assessed by a lay panel. Cognitive debriefing interviews were performed with AS patients to assess face and content validity. Finally, a sample of AS patients were included in a test-retest postal survey, administered on two different occasions, two weeks apart, to investigate the reliability and construct validity of the new Portuguese adaptation of the ASQoL. Nottingham Health Profile (NHP) was used as a comparator measure.

Results: The Portuguese version of ASQoL proved to be relevant and easy to understand.

Validation of the ASQoL included fifty-eight AS patients, with a mean age of 51 years (Range 25.0 – 80.0), with 55.2% males. The Portuguese ASQoL had good internal consistency at Time 1 (α =0.93) and Time 2 (α =0.91). Test-retest reliability was excellent, with a strong positive correlation between scores at two time points ($r=0.92$, $p<0.001$). Correlation between ASQoL scores and NHP was moderately strong with Spearman's rank correlation coefficients between ASQoL and NHP section scores, including the distress scale embedded within, all $p<0.001$. These results suggest that patient's quality of life is influenced by many factors in addition to disease severity, including social skills and ability to adapt to physical limitations.

The Portuguese version of ASQoL was able to discriminate between patients who differed on their perception of general health and presence of comorbidity, although there were no significant differences according to self-perception of disease severity.

Conclusions: The Portuguese version of the ASQoL performed well, demonstrating good psychometric properties for use in clinical studies and trials of patients with AS. The lack of significance in the analysis by self-perceived disease severity may be due to the relatively small sample size.

AB1162 RAPID3 SCORE CAN PREDICT DISEASE ACTIVITY IN PRIMARY SJÖGREN'S SYNDROME

B. Öz[1], A. Karatas[1], Z. Ömercikoğlu[2], O. Catak[3], N. Gozel[2], S. Cur[2], E. Donder[2], S.S. Koca[1]. *[1]Rheumatology Department; [2]Department of Internal Medicine; [3]Department of Ophthalmology, Faculty of Medicine, Firat University, ELAZIG, Turkey*

Background: Sjögren's syndrome (SS) is a chronic autoimmune disease that causes salivary and lacrimal gland dysfunction, resulting in oral and ocular dryness. The European League Against Rheumatism (EULAR) SS disease activity index (ESSDAI) is a systemic disease activity index measuring disease activity in patients with SS. The ESSDAI includes 12 domains. EULAR SS patient-reported index (ESSPRI) is used to evaluate dryness, fatigue, and pain symptoms, and their impact on the disease. Routine Assessment of Patient Index Data 3 (RAPID3) is used to evaluate disease activity in patients with rheumatoid arthritis which is another inflammatory disorder.

Objectives: This study aims to evaluate whether RAPID3 is useful in primary SS.

Methods: 30 patients with primary SS were enrolled in the study. ESSDAI, ESSPRI and RAPID3 scores were recorded. Chi-square, Mann Whitney U test and Pearson correlation analysis were performed for the statistical analysis.

Results: Demographically and clinical data were shown in the Table-1. Mean ESSDAI, ESSPRI and RAPID3 scores were 3.8±3.6, 5.8±1.7, and 14.8±5.2, respectively. RAPID3 scores were positively correlated ESSPRI ($r=0.669$, $p<0.001$). In addition, when we set the cut-off value to 12 on the RAPID3 score (>12 accepted as active, and ≤ 12 accepted as inactive), ESSPRI score was significantly higher in active patients (6.4±1.4 vs. 4.1±1.4, p=0.002). However, there was no relationship between RAPID3 and ESSDAI scores.

Schirmer test was positively correlated with tear break up time (BUT) ($r=0.573$, $p=0.007$). Lissamine green score was negatively correlated with Schirmer test and BUT ($r=-0.484$, $p=0.007$, and $r=-0.507$, $p=0.004$, respectively). Despite there was high compliance among these three scales evaluating eye involvement, these scales did not appear to correlate with the ESSDAI, ESSPRI, and RAPID3 scores that assess global disease activity. The mean age was significantly higher in patients with Schirmer test ≤ 5 mm compared to the patients with >5 mm (55.6±6.9 vs. 47.6±8.5 years, p=0.044).

Table 1. Demographics and clinical variables

	SS (n=30)
Mean age, years	51.0±8.7

Schirmer test, mm	11.4±6.4
BUT, sec	3.2±1.8
Lissamine green score	2.2±1.1

SS; Sjögren's syndrome, WBC; white blood cell count, ESR; erythrocyte sedimentation rate, CRP; C-reactive protein, ANA; anti-nuclear antibody, HAQ; health assessment questionnaire, BUT; tear break up time.

Conclusions: In SS, it is not simple to detect disease activity. Comorbid psychosomatic diseases affect the set detecting global disease activity. On the other hand, the activity of glandular involvement and global disease activity are not with compliance. Therefore, new and easy tools are necessary in primary SS. In our study, RAPID3 score is corelated with ESSPRI. This result suggests that RAPID3 is useful to detect disease activity in primary SS.

AB1163 ANTIBODIES BINDING SYNTHETIC OLIGONUCLEOTIDES DISTINGUISH LUPUS FROM RHEUMATOID ARTHRITIS, SCLERODERMA AND SJOGREN'S SYNDROME

C. Putterman[1], A. Gabrielli[2], A. Balbir-Gurman[3], P. Safer[4], K. Jakobi-Brook[4], R. Sorek[4], I. Gluzman[4], S. Wallace[5], I.R. Cohen[6]. *[1]Division of Rheumatology, Albert Einstein School of Medicine, NY, United States; [2]Istituto di Clinica Medica dell'Università di Ancona, Ancona, Italy; [3]Rheumatology Unit, Rambam Health Care Campus and Rappaport Faculty of Medicine, Technion, Haifa; [4]ImmunArray LTD, Rehovot, Israel; [5]ImmunArray Inc, VA, United States; [6]Weizmann Institute of Science, Rehovot, Israel*

Background: The SLE-key® RuleOut iCHIP® antigen microarray-based test rules out a diagnosis of SLE with a sensitivity of 94%[1].

Objectives: Here we report the use of the iCHIP® platform and a set of synthetic oligonucleotide antigens to distinguish between SLE subjects and those with a diagnosis of Rheumatoid Arthritis (RA), Scleroderma (SSc), Sjogren's syndrome (SS), or healthy individuals (HC).

Methods: We examined IgM and IgG antibody binding to 22 synthetic oligonucleotides (44 features) in the sera of HC subjects (N=40); SLE (N=30); SSc (N=40); SS (N=20); or RA (N=30) patients. Univariate analysis (FDR adjusted p-values) was used to determine the ability of each feature to separate between SLE and the different classes of subjects.

Results: Table 1 shows that multiple oligonucleotides successfully distinguished SLE patients from all other groups. All significant features were IgG antibodies, except for 1 IgM. Table 2 shows the impact of single nucleotide change on autoantibody binding. PolyG (G17) separates SLE from all but SS. T1G16 separates SLE from HC subjects, while G16T1 gave no significant separation. The addition of a G to the 5' and 3' end of T16 enhanced IgG antibody binding and improved separation between SLE and other autoimmune diseases with at least 10-fold improved significance as compared to T20. PolyG sequence length impacts the ability of the oligonucleotides to separate between SLE and the other groups (Fig. 1A). Unexpectedly, sequences either shorter or longer than G14 were effective in separating SLE from HC, RA, and SSc, while G14 was not effective. Furthermore, none of the polyG homopolymers could separate SLE from SS. Sequences rich in C or T were more effective at separating between SLE and SS patients (Fig. 1B).

Table 1

SLE Compared to:	Number of significant oligonucleotides Minimal FDR corrected p value: 0.003–4E-6	
	IgG	IgM
HC	17	0
RA	10	0
SSc	14	1
SS	2	0

Table 2

Class	Oligo	HC Vs SLE	RA Vs SLE	SSc Vs SLE	SS Vs SLE
PolyG ± 3' or 5' T	G17	0.04	**0.0006**	**0.007**	NS
	T1G16	0.03	NS	NS	NS
	G16T1	NS	NS	NS	NS
PolyT ± 3' & 5' G	GT16G	**0.000004**	**0.008**	**0.0001**	**0.003**
	T20	**0.001**	0.03	**0.007**	0.04

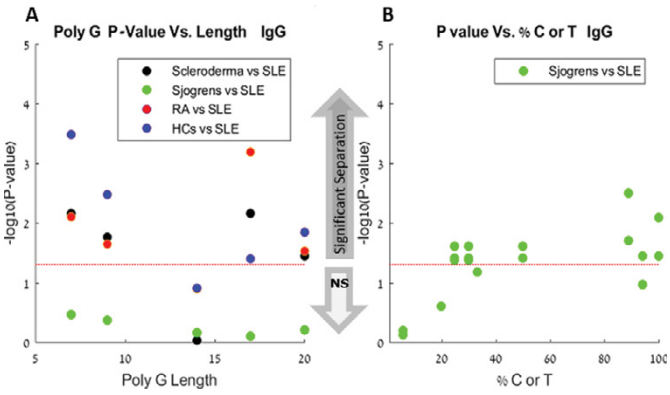

Figure 1

Conclusions:

- Autoantibody binding to oligonucleotides can be used to differentiate SLE from other autoimmune conditions and healthy subjects.
- The structural basis for the differences in binding of antibodies from disease sera to the various oligonucleotides is not yet understood, but may be due to immunologically unique conformations and secondary structures of oligonucleotides of defined length and sequence.
- SSc can be differentiated from SLE based on particular antibody binding to epitopes of oligonucleotides containing C and T.
- RA can be differentiated from SLE more significantly than the other autoimmune conditions.

- The iCHIP® microarray technology is being further developed to generate a clinically useful test to rule in a diagnosis of SLE relative to other related autoimmune diseases.

AB1164 RABIOPRED, AN INNOVATIVE THERAGNOSTIC TOOL FOR PRECISION MEDICINE IN RHEUMATOID ARTHRITIS PATIENTS

E. Schordan[1], M. Mehdi[1], S. Danilin[1], M. Coq[1], M. Schumacher[1], T. Huizinga[2], H. Firat[1]. *[1]Firalis, Huningue, France; [2]Leiden University Medical Center, Leiden, Netherlands*

Background: Anti-TNF alpha biologicals are an important breakthrough in the treatment of Rheumatoid Arthritis (RA) patients. However, 30–40% of RA patients do not respond to these therapies. Therefore, there is an unmet need for a tool to predict treatment response that would help clinicians choose an optimal treatment for RA patients.

Objectives: Under the framework of Horizone2020 SME Instrument of European Commission, Firalis has identified and developed a panel of 2159 mRNA genes which can predict non-response to anti-TNF alpha therapy using the HTG EdgeSeq platform, an innovative combination of a nuclease protection assay & next generation sequencing (NGS).

Methods: RABIOPRED assay is a proprietary panel of Firalis signatures, which also includes targets selected by the *BTCure consortium*, to predict treatment response of anti-TNF alpha biologicals. In total 2175 targets were selected for the development and 2159 are successfully included in the panel. Each oligonucleotide is a 100-mer comprising a 25-mer "wing" at the 5' end and 3' end, and a 50-mer sequence in between that is complementary to the target mRNA. QC is checked for secondary structure and absence of homology with other sequences. Analytical parameters are assessed and repeatability of the RABIOPRED assay is validated on both Paxgene and purified RNA samples. Sample input is set at 32 µl for Paxgene RNA blood and 25 ng for extracted RNA.

Results: Mean correlation factor for 12 samples on 8 replicates for Paxgene and RNA samples are $R^2>0.97$ and $R^2>0.99$ respectively. First analysis and predictive modelling shows an AUC over 0.95 for the prediction of non-response to anti-TNF alpha. In the present work, we disclose the performance of the CE-IVD RABIOPRED assay based on more than 200 samples obtained from the prospective clinical studies, PRINT and RA-TNF. The algorithm will be further validated within the ongoing RABIOPRED Proof-of-Performance study (ClinicalTrials.gov Identifier: NCT03016260) in 720 patients treated by anti-TNF alpha biologicals (5 originators and 3 biosimilars) launched in December 2016. First version of the CE-IVD RABIOPRED assay will be available during Q2 2017 and open for testing.

Conclusions: We are showing that we can accurately measure mRNA expression with RABIOPRED assay using HTG-EdgeSeq NGS platform. Preliminary performance of the assay shows that it can efficiently predict treatment response to anti-TNF alpha biologicals. The algorithm will be later on validated in a multi-centric proof-of-performance clinical study.

AB1165 THE MINIMAL CLINICALLY IMPORTANT DIFFERENCE (MCID) RAISES THE SIGNIFICANCE OF OUTCOME EFFECTS ABOVE THE STATISTICAL LEVEL

F. Angst[1], A. Aeschlimann[1], J. Angst[2]. *[1]Research, Rehabilitation Clinic "REHACLINIC", Bad Zurzach; [2]Psychiatry, Psychotherapy and Psychosomatics, Psychiatric Hospital Burghölzli, University of Zurich, Zurich, Switzerland*

Background: In measurement of outcome effects, the patient's subjective perception to feel a change in health defines clinical effectiveness irrespective of statistical significance. Nevertheless, many – especially pharmacological – studies argue with statistical effects alone.

Objectives: To review, develop, illustrate, and discuss current and proposed new concepts of effect quantification and significance.

Methods: Different methods for determining minimal clinically important differences (MCIDs) were reviewed and further developed focusing on their characteristics and (dis)advantages. The concepts were illustrated by empiric rehabilitation effects (evaluation study) and a randomized controlled trial (investigative study) in knee osteoarthritis.

Results: In controlled studies, empirical score differences between verum and placebo become statistically significant if sample sizes are sufficiently large. For example, a score difference of 5 points (scale 0–100) between the verum and the placebo effect becomes statistically significant, if the sample sizes are $n\geq33$ for each of both groups at a standard deviation=10 of the score differences (baseline to follow-up). MCIDs by contrast, are defined by patients' perceptions, which led to "anchoring" of effects by the "transition" item, where patients rate their change of health between baseline and follow-up in an evaluation study. The MCID for improvement by the "mean change method" is the difference of the mean change experienced by the "slightly better" group minus that of the "almost equal" group. The MCID can be expressed as absolute or relative score, as effects size (ES), standardized response mean (SRM) and standardized mean difference (SMD) (bivariate). It can further be adjusted by multivariate regression modeling. In our example of knee osteoarthritis, the MCID for pain relief was 8.74 score points (scale 0–100), 17.15% of the baseline score, ES=0.407, SRM=0.413, SMD=0.469. This is consistent to the range of 0.30–0.50 for MCIDs reviewed in literature. After adjusting for potential confounders, the MCID was 7.09 score points or an increase of 2.9% per score point to feel better obtained by logistic regression.

Conclusions: Absolute and relative MCIDs are easy to interpret and apply to data of investigative studies. MCIDs expressed as ES/SRM/SMD reduce bias, which mainly results from dependency on the baseline score. Multivariate linear and logistic regression modeling further reduces bias by adjustment for possible confounders and increase validity. Anchor-based methods use clinical/subjective perception to define MCIDs and should be clearly differentiated from distribution-based methods that provide statistical effect significance only.

AB1166 QUANTUM BLUE® ADALIMUMAB: EVALUATION OF A POINT OF CARE RAPID TEST FOR THERAPEUTIC DRUG MONITORING OF SERUM ADALIMUMAB LEVELS

F.I. Bantleon, S. Kräuchi, T.B. Schuster, M. Schneider, J.M. Weber. *Bühlmann Laboratories Ag, Schoenenbuch, Switzerland*

Background: Rheumatoid arthritis (RA) is a systemic autoimmune disease affecting approximately 1% of the population [1]. The pathogenesis of RA involves the overexpression of tumor necrosis factor alpha (TNFα) and other cytokines [2]. Adalimumab (ADA) is a human monoclonal antibody directed against TNFα and is highly effective in the treatment of RA. For efficient treatment trough levels of ADA need to be adjusted within a therapeutic window which is 5 to 10 µg/mL [3]. A rapid test allows faster reporting of trough levels, providing a great advantage over test formats that need samples to be sent to a central or service laboratory. Here we report on the technical performance evaluation of the Quantum Blue® Adalimumab lateral flow test.

Objectives: Development and performance evaluation of a rapid test for the monitoring of ADA trough levels in human serum at the point of care.

Methods: The sandwich lateral flow immunoassay uses a TNFα coated gold label and a highly specific monoclonal antibody immobilized on the test membrane to detect ADA in diluted human serum samples. Sensitivity of the assay was determined by calculating limit of detection (LoD) and limit of quantification (LoQ) according to CLSI EP17-A2 guideline. Moreover, the assay was evaluated regarding cross-reactivity with other therapeutic antibodies targeting TNFα, influence of rheumatoid factors (RF) and high dose hook effect. A method comparison was performed against a commercially available ELISA (RIDASCREEN® ADM Monitoring, R-Biopharm, Germany) to compare the trough level results of 40 patients treated with ADA. All statistical analyses were performed with Analyse-it for Excel.

Results: The Quantum Blue® Adalimumab test allowed analysis of serum samples within 15 minutes. The samples were diluted 1:20 in chase buffer before application onto a test cassette (volume 80 µL). The readout was performed with the Quantum Blue® Reader resulting in adalimumab concentration levels in the lower µg/mL range. The test exhibited a LoD of 0.2 µg/mL and a LoQ of 0.69 µg/mL. No high dose hook effect was detected for samples containing up to 1000 µg/mL ADA. The latter two data sets allowed a measuring range of 1 to 35 µg/mL of ADA in patient samples. Other therapeutic TNFα blockers, like infliximab and golimumab, showed no cross-reactivity with the Quantum Blue® Adalimumab test. RF showed no influence on correct measurement of ADA at all tested concentrations. The method comparison to a well-established commercial ELISA method revealed a slope of 1.12 and a regression coefficient (r^2) of 0.90 (by Passing-Bablok). A Bland-Altman analysis showed a bias of 1.9% confirming the overall excellent correlation of the two methods as well as the accuracy of our newly developed rapid test.

Conclusions: The BÜHLMANN Quantum Blue® Adalimumab assay enables the quantitative determination of ADA trough levels over the clinically relevant range in serum with a time to result of only 15 minutes. The assay exhibits an excellent accuracy and correlation to a well-established laboratory reference

method. Hence, it represents a valuable tool for the clinician to assess the trough levels during ADA treatment follow up at the point of care.

AB1167 AUTOREACTIVE T CELLS TO CITRULLINATED HSP90 IN INTERSTITIAL LUNG DISEASE IN RHEUMATOID ARTHRITIS

J. Chen[1], S. Song[2], Y. Liu[3], D. Liu[4], S. Ge[5], D. Ascherman[6]. *[1]Rheumatology, Xiamen University, Xiamen; [2]Rheumatology, The First Affiliated Hospital of Xiamen University; [3]State Key Laboratory of Molecular Vacinology and Molecular Diagnosis, Xiamen University; [4]Radiology, The First Affiliated Hospital of Xiamen University; [5]State key Laboratary of Melecular Vacinology and Molecular Diagnosis, Xiamen University, Xiamen, China; [6]Rheumatology, University of Miami Miller School of Medicine, Florida, United States*

Background: Previous studies have indicated that anti-citrullinated protein antibody (ACPAs) titers are associated with the presence and severity of interstitial lung disease (ILD) in RA. The lung might be a site of initiation of immunity to citrullinated proteins. Previous studying anti-citrullinated HSP90 (citHSP90β) profiles between bronchial veolarlavage fluid (BALF) and serum indicated the lung plays a direct role in shaping the immune repertoire of RA-ILD.
Objectives: Whether citHSP90β contributes to the initiation or perpetuation of autoimmune interstitial lung abnormalities (ILA) in RA remains to be clarified. To address this issue we investigated the spontaneous T cell responses to the putative autoantigen citrullinated HSP90β in different stages of RA-ILD.
Methods: In RA-no ILD (n=19), indeterminate ILD (ILA1) (n=24), subclinical RA-ILD (ILA 2) (n=20), clinical RA-ILD (ILA3) (n=4) and other connective tissue disease associated ILD (CTD-ILD) (n=14) patients. Cultures derived from whole blood were individually stimulated with HSP90β, citHSP90β, citrullinated BSA, or no antigen. The concentration of 13 cytokines and chemokines in the plasma supernatant were then measured using Luminex xMAP technology.
Results: CitHSP90β induced significantly higher levels of IFN-γ levels in RA-ILD (ILA=2+3) groups compared to the RA-no ILD group (p=0.002), but did not stimulate the production of other cytokines (p>0.05). Furthermore, citHSP90β did not stimulate the production of IFN-γ or other cytokines stimulated those individuals with non-RA CTD-ILD (p=0.1039, IFN-g).
Conclusions: The production of IFN-γ by T cells stimulated with citHSP90b demonstrates a bias toward TH1 immune responses that are likely involved in the pathogenesis of RA-ILD. The presence of autoreactive Th1-like cells in RA patients in conjunction with citrullinated autoantigens may indicate the involvement of this autoantigen in the pathogenesis of RA-ILD. Early targeting of the immune reactions in the lung might therefore be a new approach to modulate disease.

AB1168 TOUCH STUDY: TECHNOLOGY AND OUTCOMES USED IN CLINIC IN A DAY HOSPITAL

L. Cunha-Miranda[1], C. Miguel[1], C. Silva[1], F. Barcelos[1], R. Marques[1], R. Trinca[2], A. Cardoso[3], J. Borges[1], S. Fernandes[1], H. Santos[1], A. Faustino[1]. *[1]Rheumatology; [2]Nurse Day Hospital; [3]Nutrition, Instituto Português de Reumatologia, Lisboa, Portugal*

Background: Patient reported outcomes PRO are a key element in the global evaluation of patients, especially those followed in a day hospital. The use of touchscreen computers is one of the new features in the day hospital of Instituto Português de Reumatologia.
Objectives: to evaluate the transition from paper to touchscreen computers technology of the PRO in use in Reuma.pt
Methods: We considered a step up model of comparison with 2 months intervals one before the use of the touchscreen computers, one two months after the introduction of touchscreen computers and a third after an intermediate evaluation (comparison between interval 0 and 1) of the results.A specific formation to physicians and nurses to be aware of missing data from non-total completion of the questionnaires was introduced between the first and second evaluation. The percentage of questionnaires totally completed by number of patients were obtained for every period and diagnosis
Results: 631 day hospital appointments were evaluated according to diagnosis and interval and the percentage was obtained (Table 1)

Table 1. Results comparing questionnaires by diagnosis and intervals

	Paper interval 0 (Sept –Nov 15)			Interval 1 (Nov 15- Jan 16)			Interval 2 (Jan – Mar 16)		
AS	N	N Quest.	Pct.	N	N Quest.	Pct.	N	N Quest.	Pct.
BASDAI	95	95	100,00%	92	87	94,57%	93	92	98,92%
BASFI	95	94	98,95%	92	89	96,74%	93	92	98,92%
EQ5D	95	91	95,79%	92	85	92,39%	93	88	94,62%
AsQol	95	88	92,63%	92	83	90,22%	93	85	91,40%
SF-36	95	80	84,21%	92	72	78,26%	93	77	82,80%
HADS	95	27	28,42%	92	87	94,57%	93	91	97,85%
FACIT	95	93	97,89%	92	91	98,91%	93	92	98,92%
RA									
HAQ	112	111	99,11%	124	124	100,00%	115	114	99,13%
SF-36	112	96	85,71%	124	101	81,45%	115	98	85,22%
HADS	112	9	8,04%	124	111	89,52%	115	114	99,13%
FACIT	112	108	96,43%	124	122	98,39%	115	114	99,13%
EQ5D	112	105	93,75%	124	119	95,97%	115	113	98,26%

Only HADS had a significative (p<0.000) improvement for every disease, with the use of the touchscreen computers from interval 1 to 2. On our intermediate evaluation comparing paper to tablet we saw a lower percentage of questionnaires fully completed (although not statistical significative) and a formal awareness formation addressing the causes was made with all the physicians and nurses of the day hospital. The PRO from Reuma.pt was not developed for tablets and some issues regarding missing data associated with that was found
Conclusions: The use of technology can contribute for better data in Reuma.pt and other national registries by saving time (medical and nurse) for clinical evaluation, by integrating patients in their evaluations and by cost reduction, and carbon footprint. Issues regarding the adaptability of software to tablet technology have to be addressed to insure an overall improvement.

AB1169 COMPENSATORY INCREASE IN FCΓRIIB EXPRESSION ON B CELLS IN PATIENTS WITH SYSTEMIC SCLEROSIS

N. Yagi, T. Matsushita, Y. Hamaguchi, K. Takehara. *Department of Dermatology, Faculty of Medicine, Institute of Medical, Pharmaceutical and Health Sciences, Kanazawa University, Kanazawa, Japan*

Background: Systemic sclerosis (SSc) is a systemic autoimmune disease that is characterized by excessive fibrosis and microvascular damage. The contribution of B cells to the pathology of SSc has been mainly recognized as polyclonal B cell activation and autoantibody production. The receptor for the Fc region of IgG (FcγRs) is member of the Ig superfamily, the members of which modulate the activation and inhibition of immune responses. FcγRIIB is the only FcγR that has an inhibitory function. Previous studies revealed that a decrease in the expression of FcγRIIB on B cells induced excessive immune responses and resulted in the development of autoimmunity. However, the expression levels of FcγRIIB on B cells in SSc currently remain unknown.
Objectives: We aimed to clarify how the abnormal activation of B cells involves inhibitory FcγRIIB on B cells in SSc patients.
Methods: Blood samples were collected from 76 SSc patients (38 limited cutaneous SSc [lcSSc], 38 diffuse cutaneous SSc [dcSSc]) and 59 healthy subjects. We evaluated the expression of FcγRIIB, CD80, CD86, and CD95 on B cell subsets. B cells were classified into five subsets depending on their surface molecular expression by flow cytometry: naïve B cells ($CD19^+IgD^+CD27^-$), preswitched memory B cells ($CD19^+IgD^+CD27^+$), double negative (DN) memory B cells ($CD19^+IgD^-CD27^-$), switched memory B cells ($CD19^+IgD^-CD27^{mid}$), and plasmablasts ($CD19^+IgD^-CD27^{high}$). The mRNA expression of FcγRIIB was measured using real-time PCR. We examined the relationship between FcγRIIB expression and clinical features.
Results: The expression of FcγRIIB on SSc naïve B cells and DN memory B cells was significantly stronger than that on the B cells of healthy subjects (Figure 1) (p<0.05 and p<0.001, respectively). FcγRIIB mRNA expression on SSc B cells was also significantly stronger than that on the B cells of healthy subjects (p<0.01). The expression of CD80, CD86, and CD95, activation markers on B cells, was stronger in all 5 B cell subsets, except for CD80 in switched memory B cells and plasmablasts. Patients with the stronger expression of FcγRIIB on DN memory B cells more frequently had interstitial lung disease than those with normal levels (p<0.05). Cyclophosphamide pulse therapy significantly reduced the expression of FcγRIIB on preswitched memory B cells and switched memory B cells (p<0.05 and p<0.05, respectively).

Conclusions: Our results suggest that SSc B cells exhibit compensatory increases in the expression of FcγRIIB in order to suppress the abnormal activation of B cells, and the expression of FcγRIIB may be an indicator of the clinical severity of SSc.

AB1170 PREVALENCE OF ANTI-CARP ANTIBODIES IN PATIENTS WITH PRIMARY SJÖGREN'S SYNDROME: ASSOCIATION WITH CLINICAL, SEROLOGICAL AND HISTOLOGICAL ASPECTS

S. Colafrancesco [1], G. Piacarelli [1], A. Pecani [1], T. Colasanti [1], F. Spinelli [1], C. Alessandri [1], C. Barbati [1], M. Vomero [1], B. Cerbelli [2], R. Priori [1], G. Valesini [1]. *[1] Dipartimento di medicina interna e specialità mediche; [2] Dipartimento di radiologia, Oncologia e Scienze Patologiche, Sapienza Univeristy of Rome, Rome, Italy*

Background: The presence of antibodies against carbamylated peptides (anti-CarP) has been associated with increased disease activity and severe joint damage in rheumatoid arthritis. Our group has demonstrated their presence also in other inflammatory conditions with a high prevalence in Sjogren's Syndrome (SS) (14/45, 31.1%)[1]. There is only one study up to now investigating anti-CarP in SS demonstrating a prevalence of these antibodies in 27% of cases and an association with the presence of germinal centres (GCs)[2]. Thus, these antibodies have been proposed as a new tool for identifying SS patients with a more aggressive disease.
Objectives: To confirm the presence of anti-CarP antibodies in a large mono-centric cohort of patients with SS and investigate their association with clinical, serological and histological features.
Methods: Serum samples from consecutive patients with SS (AECC criteria) were collected and stored at -20°. Anti-CarP antibodies were detected by a modified solid-phase "home-made" ELISA[1]. The mean +3 times SD was used as cut-off. Minor paraffin embedded salivary glands were stained by H&E and IHC using lymphocytes T and B markers [anti-CD3, anti-CD20 (DAKO)]. GCs presence was defined by H&E and confirmed by identification of follicular dendritic cells (anti-CD21, DAKO). Images were analysed as follows: focus score (FS) calculation, mean foci area, presence of segregated foci (SF), GCs and lymphoepithelial lesions (LELs).
Results: Clinical and laboratory features of SS patients are shown in table. Serum anti-CarP were detected in 30/104 patients (28.8%) without association with any clinical or serological feature (Fisher's exact test). Positive patients were more likely to present SF (P=0.024). No association was found with the presence of GCs or LELs. Anti-CarP titre correlated with the FS (P=0.045, r=0.304), the number of foci (P=0.008, r=0.347), mean foci area (P=0.028, r=) and the percentage of SF (P=0.046, r=0.331) (Spearman's test). Prevalence of anti-CarP was higher in patients with arthritis [7/15 (46.6%)] than those without ([23/89 (25.8%)] (p>0.05).

Clinical features	Number (%)
Sex (M/F)	5/99
Age at diagnosis (mean±SD, years)	53±11.7

Anti-La/SSB	42/104 (40.3)
Hypergammaglobulinemia	28/104 (26.9)
Rheumatoid factor	38/104 (36.5)
Leucopenia	21/104 (20.1)
Hypocomplementemia	9/104 (8.6)
Monoclonal component	8/104 (7.6)
Cryoglobulinemia	5/104 (4.8)

Mean anti-CarP titre was higher in patients with arthritis compared to those without (322.3±173.8 aU/ml vs 279.5±171.1, P=0.004, respectively).
Conclusions: This is the largest cohort of SS patients screened for anti-CarP so far. Our results show a prevalence of anti-Carp antibodies in agreement with the literature; however, no association was found with any clinical or serological aspect. Anti-CarP do not seem to be associated with histological features predictive of lymphoma, i.e. CGs and LELs. Nonetheless, considering the titre correlation with the FS, mean foci area and percentage of segregation, higher serum levels of anti-CarP may reflect a severe tissue inflammation more prone to form organized infiltrates. This finding, in association with the evidence of higher levels in patients with arthritis, may support the idea that these antibodies are useful to measure the severity of systemic inflammation.

AB1171 ARTICULAR AND EXTRA-ARTICULAR DAMAGE INDEX ASSESSMENT IN JUVENILE IDIOPATHIC ARTHRITIS PATIENTS

S.M. El-Gamal, E.A.K. Elewa, M.M. Ashour. *Rheumatology and Rehabilitation, Zagazig University Hospitals, Zagazig, Egypt*

Background: Juvenile Idiopathic Arthritis is a broad term used to describe several different forms of chronic arthritis in children. Variable assessment tools can be used for assessment of JIA disease activity. JADI is composed of 2 parts (Viola et al., 2005).
Objectives: Assessment of the articular and extraarticular damage index in juvenile idiopathic arthritis patients.
Methods: This study was carried out on 60 JIA patients. Patients who had inflamed synovia related to trauma or malignant disease, septic arthritis, bone diseases, as dysplasia or osteomyelitis were excluded. *Clinical assessment:* sex, age at disease onset, JIA category, educational level, loss of school years and previous use of systemic corticosteroid and second-line drug therapies. *Local examination:* Number of swollen joints, joints with pain on movement/tenderness, joints with limited range of motion, joints with active arthritis were recorded for every patient. *Disease activity:* was measured by using the (JADAS-27). *Functional ability:* was assessed by (CHAQ). *Laboratory assessment:* included ESR and CRP. *Radiographic assessment:* scored according to the adapted Sharp/van der Heijde score. *Damage assessment:* was assessed using the Juvenile Arthritis Damage Index.The (JADI-A) and (JADI-E).
Results: *Patient characteristics:* 6 had systemic onset, 29 had polyarthritis, 14 extended oligoarthritis, 11 had persistant oligoarthritis and none of them had psoriatic arthritis. 38 females and 22 males (56.7%) percent of patients lost some years of education ranging from 0–3 years. Patients in remession were very few 5 patients only. According to the C-HAQ score (13.3%) of patients had no disability (11.7%) mild disability (41.6%) moderate disability and (33.3%)severe disability. 60% patients had articular damage and 35% patients had extraarticular damage. The wrist was the most frequently damaged joint.The growth failure, pubertal delay and leg length discrepancy were the most frequently reported extraarticular items. *Correlation of JADI with other disease variables:* showed that JADI-A is correlated with physician's global assessment, CHAQ, radiological damage.
Conclusions: Ours is the first study that has used JADI to assess outcome in patients with JIA in Egypt. JADI has a good correlation with traditional outcome measures in JIA and may be a good tool to be used in clinical practice and is likely to increase current understanding of the natural history of the disease.

AB1172 NEUROPATHIC PAIN SCREENING TOOLS IN RHEUMATOID ARTHRITIS: REAL WORLD DATA

T. Martins Rocha[1], S. Pimenta[1], M. Bernardes[1], A. Bernardo[1], M. Barbosa[2], R. Lucas[3], L. Costa[1]. *[1]Rheumatology; [2]Pain Unit, Centro Hospitalar de São João; [3]Clinical Epidemiology, Faculty of Medicine University of Porto (FMUP), Porto, Portugal*

Background: The Leeds Assessment of Neuropathic Symptoms (LANSS) and the painDETECT questionnaire (PDQ) are two validated screening tools for neuropathic pain (NP). Recent evidence reported a low level of agreement between these tests in knee Osteoarthritis. Several studies have recently applied the PDQ in Rheumatoid Arthritis (RA), suggesting a NP component in these patients, although the application and performance comparison with LANSS is yet to be studied.
Objectives: Evaluate PDQ and LANSS performance for NP classification and investigate its optimal cutoff points in a RA cohort.
Methods: Observational, cross-sectional study was designed including RA patients followed at our Rheumatology department. Patients with diagnosed neuropathy or non-RA risk factors for NP were excluded. Selected patients were evaluated in a medical visit where LANSS and PDQ were applied. Agreement between the two questionnaires was evaluated using kappa coefficient analysis. Receiver operating characteristic (ROC) analysis was performed using each tool as gold-standard and cutoff points to optimize agreement were investigated. Non-concordant patients were compared with concordant patients using parametric and non-parametric tests. Significance level was set as <0.05.
Results: 112 RA patients were included, 86 (77%) were females, with a mean (SD) age of 55.1 (10.8) years and median disease duration of 13 years (range: 2–41). 102 (91%) were treated with DMARDs and 42% with a biologic DMARD. 45 (40%) patients had NP applying the LANSS ($\geq$12) and 28% had NP in the PDQ (19 possible and 12 likely; no demographic or clinical significant differences were found between these two groups). 82 (73%) patients had concordant NP classification (59 negative, 23 positive) by the two tests. Concordant group had significantly superior median disease duration and inferior LANSS scores compared to non-concordant group (14 *vs* 12 years and 8 *vs* 13, respectively, $p<0.05$) with no other significant differences found. A moderate agreement (κ=0.41) and linear correlation (r=0.58, $p<0.001$) were observed between the two tests. In the ROC curve analysis, PDQ ($\geq$13) showed an area under the curve (AUC) of 0.80, 95% CI [0.72–0.88] with a sensitivity and specificity of 51% and 88%, respectively, using LANSS as gold standard. LANSS ($\geq$12) had an AUC of 0.80, 95% CI [0.71–0.90] and a sensitivity and specificity of 74% and 73%, respectively, using PDQ as gold standard. After ROC curve analysis, optimal cutoff for PDQ was 10, showing greater sensitivity (69%) but lower specificity (79%) with a slight increase in the agreement between the tests (κ=0.48). For the LANSS, the optimal cutoffs were the previous value or 13 (sensitivity 68% and specificity 78%) with a modest gain in the agreement (κ=0.42). Correction for both cutoff points resulted in a more substantial increase in agreement level (κ=0.51).
Conclusions: In this study, LANSS and PDQ had a moderate level of agreement, possibly because they capture different dimensions of NP. New possible cutoffs were studied to increase agreement between the tests. Further studies with other conditions and a validated gold-standard for NP are needed to confirm this data.

AB1173 PHYSICIAN VISUAL ANALOG SCALE ESTIMATES FOR OVERALL GLOBAL ASSESSMENT, INFLAMMATION, DAMAGE, AND DISTRESS TO ASSESS PATIENTS AND SUPPORT CLINICAL DECISIONS IN ROUTINE RHEUMATOLOGY CARE: ANALYSIS OF INTER-RATER RELIABILITY

T. Pincus, I. Castrejon, J. Chua, A. Kugasia, J. Schmukler, S. Weinberg, J.A. Block. *Rheumatology, Rush University Medical Center, Chicago, United States*

Background: A physician global estimate of patient status (DOCGL) was developed to quantify inflammatory activity in rheumatoid arthritis (RA) clinical trials. However, DOCGL may be affected by joint damage and/or distress (in fibromyalgia, depression, etc). One approach to document the possible impact of these problems on DOCGL is to add 3 physician visual analog subscale (VAS) estimates for inflammation, damage, and distress. These subscales have been shown to be useful in patients with diagnoses other than RA (1) but inter-rater reliability has not been analyzed.
Objectives: To analyze inter-rater reliability between senior rheumatologists and trainees on 4 VAS estimates for overall DOCGL, inflammation (DOCINF), damage (DOCDAM) and distress (DOCSTR), in patients with various rheumatic diagnoses.
Methods: Patients seen in routine care were assigned 4 physician VAS estimates for overall DOCGL, and levels of inflammation or reversible symptoms (DOCINF), organ damage or irreversible symptoms (DOCDAM), and distress or symptoms not explained by inflammation or damage (DOCSTR). VAS estimates were assigned independently by a senior rheumatologist and a rheumatology trainee for the same patient at the same visit. Mean differences, correlations, and possible discordance of $\geq$2units/10 between estimates of the senior rheumatologist and the trainee were analyzed.
Results: VAS estimates by the 2 physicians were analyzed in 64 patients with different rheumatic diseases, including osteoarthritis (16%), RA (14%), fibromyalgia (14%), and systemic lupus erythematosus (13%). Mean differences of scores assigned by the senior rheumatologists versus trainees were <0.43/10, less than 5% of the total scales, slightly lower for DOCINF, and slightly higher for the 3 other subscales ($p<0.001$) (Table). Mean estimates of both physicians for damage and distress were higher than for inflammation by 1.1 to 1.6 units (Table). Correlations of all 4 VAS between rheumatologists and trainees were significant ($p<0.001$) (Table). More than 70% of the estimates were concordant for DOCGL (75%), DOCINF (78%), and DOCDAM (70%), while concordance was somewhat lower for DOCSTR (57%) (Table).
Conclusions: Good inter-rater agreement between two physicians is seen for 4 VAS estimates for overall global assessment, inflammation, damage, and distress. Mean scores for damage and distress were higher than for inflammation, indicating the complexity of rheumatology care. Quantitative scores can add to documentation of patient status and to support of clinical decisions for doctors, patients, and payers.

AB1174 ORM2 AND APOA2 SERUM LEVELS CAN PREDICT OA PATIENT RESPONSE TO CHONDROITIN SULFATE/GLUCOSAMINE HYDROCHLORIDE: RESULTS FROM THE MOVES STUDY

V. Calamia[1], M. Camacho-Encina[1], L. González-Rodríguez[1], P. Fernández-Puente[1], I. Rego-Pérez[2], M. Herrero[3], H. Martínez[3], C. Ruiz-Romero[1], F.J. Blanco[1]. *[1]Grupo de Proteomica-PBR2-ProteoRed/ISCIII-Servicio de Reumatología; [2]Grupo de Genómica-Servicio de Reumatología., Instituto de Investigación Biomédica de A Coruña (INIBIC), Complexo Hospitalario Universitario de A Coruña (CHUAC), Sergas. Universidade da Coruña (UDC)., la Coruña; [3]Clinical R&D Area, Bioiberica S.A., Barcelona, Spain*

Background: A shotgun proteomic analysis performed on sera from patients enrolled in the Multicentre Osteoarthritis interVEntion trial with Sysadoa (MOVES) led to the discovery of a panel of putative predictive protein biomarkers useful to stratify osteoarthritis (OA) patients into responders and non-responders, either to Chondroitin sulfate/Glucosamine hydrochloride (Droglican®, Bioiberica S.A.,Barcelona,Spain) or Celecoxib.
Objectives: To validate the sensitivity and specificity of a panel of six serum proteins useful to predict the patient response to Droglican treatment, in order to optimize therapeutic outcomes in OA.
Methods: We analyzed the serum levels of a panel of six putative predictive protein biomarkers by enzyme-linked immunosorbent assays (ELISAs): APOA2, APOA4, APOH, C4BPa, ITIH1 and ORM2. All the subjects studied belonged to the MOVES cohort at baseline (Droglican sub-cohort, n=260). Non-parametric and multivariate analysis were performed to test the effects of the clinical variables, including gender, age, BMI, radiologic Kellgren/Lawrence (K/L) grade and WOMAC score at baseline, as well as the serum levels of each of the six mentioned proteins, on the response to Droglican treatment according to the OMERACT-OARSI criteria and the WOMAC pain score (20%, 30%, 50% and 70% reduction) recorded at the end of the trial (after 6 months of treatment).
Results: Non parametric analysis showed decreased serum levels of ORM2

Abstract AB1173 – Table 1. Mean and SD for the four physician estimates according to the rheumatologist (rheum) and the trainee, inter-rater reliability and levels of concordance and discordance for each estimate

VAS (0–10)	Rheum	Trainee	Mean Difference	Pearson r all $p<0.001$	Rheumatologist (Rheum) and trainee discordance groups by 2/10 units, no. (%)		
					Rheum > Trainee	Rheum = Trainee	Rheum < Trainee
Overall DOCGL	3.9 (1.9)	4.0 (2.2)	-0.05 (1.9)	0.61	11 (17%)	48 (75%)	5 (8%)
DOCINF	1.7 (1.6)	1.4 (1.6)	0.28 (1.6)	0.50	8 (13%)	50 (78%)	6 (9%)
DOCDAM	2.8 (2.2)	2.7 (2.2)	0.01 (2.0)	0.61	11 (17%)	45 (70%)	8 (12%)
DOCSTR	3.3 (2.9)	2.9 (2.4)	0.43 (2.8)	0.47	12 (19%)	36 (57%)	15 (24%)

at baseline in responders to Droglican according to the OMERACT-OARSI criteria compared to non-responders (76,11±53,25 vs 104,25±84,93; n=171 *vs* 46; *p*=0,047), meanwhile the values for APOA2 appeared statistically increased in responders with a 50% reduction in WOMAC pain score compared to non-responders (79,95±58,53 vs 66,05±46,49; n=129 *vs* 112; *p*=0,028). Patients with lower levels of ORM2 (median concentration=69,8 ug/mL) and/or higher level of APOA2 (median concentration=63,8 ug/mL) showed a markedly better response to pharmacotherapy. Statistical interactions between ORM2 and APOA2 levels and radiologic K/L grade were also detected (*p*=0,048 and *p*=0,002 respectively). No statistically significant differences were found for the other four proteins.
Conclusions: Our results show that ORM2 and APOA2 levels significantly correlates with patients response to Droglican suggesting the possibility of their use in predictive assays in order to optimize therapeutic outcomes in OA. Validation studies in different cohorts are needed to identify and validate a cut-off point for these biomarkers.

AB1175 DECREASED AUTOPHAGIC ACTIVITY IN T LYMPHOCYTES FROM PATIENTS WITH NEWLY DIAGNOSED SYSTEMIC LUPUS ERYTHEMATOSUS

X. Luo[1], Y. Liu[2], M. Yang[2]. *[1]Department of Rheumatology; [2]West China Hospital, Sichuan University, Chengdu, China*

Background: Alterations in T-lymphocyte homeostasis have been suggested to play a key role in the pathogenesis of SLE. Autophagy is now emerging as a core player in the development and the functioning of the immune system.
Objectives: we investigated the autophagic behavior of T cells from patients with SLE.
Methods: Thirty patients with SLE and twenty-five healthy subjects matched for gender and age were recruited. The levels of mRNA encoding ATG5, ATG7, Beclin-1 and LC3 was determined by quantitative real-time polymerase chain reaction (qPCR), and evaluate autophagy activity in T cells by flow cytometry. The number of autophagic structures was examined by TEM in T cells from SLE patients and healthy controls.
Results: We documented a decreased of mRNA expression of LC3 and Atg7 in T cells from patients with SLE (t=2.282, P=0.027; t=3.573, P=0.001).A decreased percentage of autophagic cells was comfirmed in T cells from patients with SLE, as compared to healthy donors by flow cytometry (t=2.034, P=0.047).no significant correlations between autophagy levels in T cells and the disease activity of patients were observed ($p>0.05$).
Conclusions: Our results indicate that autophagy activity in T cells from SLE patients is decreased, which may contribute to the development of SLE, and thus that resetting autophagic activity may be an important therapeutic goal in this autoimmune disease.

AB1176 ANTI-MX1 ANTIBODY: A NEW POTENTIAL BIOMARKER EXPANDING THE CONCEPT OF INTERSTITIAL PNEUMONIA WITH AUTOIMMUNE FEATURES (IPAF)

Y. Hamano[1], H. Kida[1], A. Murakami[2], M. Yanagawa[3], K. Ueda[3], O. Honda[3], Y. Kato[1], H. Takamatsu[1], N. Tomiyama[3], A. Kumanogoh[1]. *[1]Department of Respiratory Medicine, Allergy and Rheumatic Diseases, Osaka University, Suita; [2]Medical & Biological Laboratories Co., Ltd., Ina Laboratory, Ina; [3]Department of Radiology, Osaka University, Suita, Japan*

Background: "Interstitial pneumonia with autoimmune features (IPAF)" is the updated concept instead of UCTD-ILD or lung-dominant CTD, classifying idiopathic interstitial pneumonias (IIPs) with underlying autoimmune processes by the presence of a combination of features from three domains; clinical, serologic, and morphologic domains. In IIPs, idiopathic non-specific interstitial pneumonia (INSIP) and idiopathic pulmonary fibrosis are often difficult to distinguish without surgical lung biopsy. We discovered autoantibody against myxovirus resistance protein-1 (MX1), type I interferon-inducible protein, as the biomarker specific for INSIP and associated with favorable prognosis [1]. We also reported that some of patients with collagen vascular diseases (CVDs) possess anti-MX1 antibody only when complicated with interstitial lung disease [2].
Objectives: This study was aimed to investigate the association of anti-MX1 antibody positivity with IPAF category in patients with IIPs and their clinical characteristics through a cross-sectional study. We also assessed the potential of anti-MX1 antibody to expand the concept of autoimmunity in IIPs.
Methods: Anti-MX1 antibodies in sera of consecutive Japanese patients with chronic fibrosing IIPs (n=114), who visited the outpatient office of Osaka University Hospital from February to October 2014, were measured using ELISA. IPAF patients were classified according to the IPAF criteria in 2015 ERS/ATS statement. Comparison of the patients' clinical characteristics and high-resolution computed tomography (HRCT) findings evaluated by three thoracic radiologists blinded to the clinical information were statistically analyzed. Serum IFNα was measured using ELISA.
Results: Among 114 patients with IIPs, 20 patients (17.5%) were positive for anti-MX1 antibody and 33 patients (28.9%) were classified as IPAF. When IPAF patients (n=33) were compared with non-IPAF patients (n=81), IPAF was associated with female, higher level of C-reactive protein (CRP), the presence of HRCT findings of "predominantly peribronchovascular distribution" and the absence of two HRCT findings of "honeycombing' and 'traction bronchiectasis". Of 81 non-IPAF patients, 13 patients (16.0%) were anti-MX1 antibody positive. Among them, if anti-MX1 autoantibody were included into the existent serological domain in the IPAF criteria, 8 patients (9.9%) would be classified as IPAF. Anti-MX1 antibody positivity did not correlate with IPAF category. In non-IPAF patients, anti-MX1 antibody-positive patients were associated with female and predominantly smaller 'spared area' when compared to anti-MX1 antibody-negative patients. Serum IFNα concentration was not associated with either anti-MX1 antibody positivity or IPAF category.
Conclusions: A substantial number of patients classified as non-IPAF were positive for anti-MX1 antibody, suggesting that this new autoantibody could have the potential expanding the definition of IPAF. The further studies for the clinical course and drug efficacy of anti-MX1 antibody-positive non-IPAF patients must be explored.

Rehabilitation

AB1177 THE COMBINATION OF PHYSIOTHERAPY AND BIOLOGICAL THERAPY FOR THE MANAGEMENT OF ANKYLOSING SPONDYLITIS

A. Sehimi, Y. Slimani, N. Messaoud, O. Bensaber. *Physical Medicine and Rehabilitation Department, University Hospital and Medicine Faculty of Sidi Bel Abbes, Sidi Bel Abbes, Algeria*

Background: The management of the ankylosing spondylitis (AS) aims at relieving patients'pain, restoring their joint mobility and preventing structural damage which results in progressive deformity, in order to improve the functional status and quality of life of these patients, using various pharmacological and non-pharmacological means. The importance of the physiotherapy in patients with AS under biological treatment was reported in some studies, but the literature on this topic is still scarce.
Objectives: Report the experience, of our department of Physical and Rehabilitation Medicine, in the management of the AS, especially the effect of the combination of physiotherapy and biological therapy on pain, disease activity, spinal mobility, functional capacity and quality of life.
Methods: Prospective study on 20 patients diagnosed with AS, treated with tumor necrosis factor alpha inhibitors (TNFa inhibitors) and placed under physiotherapy for 3 months. At baseline and at the end of 3 months, we evaluated Bath AS Disease Activity Index (BASDAI), occiput-wall distance, Hirtz index, Schober index, Bath AS Functional Index (BASFI) and Visual Analog Scale (VAS) of patient's quality of life.
Results: The 20 patients (9 females), aged 38.4 years±10.24 [range 19–55], treated with TNFa inhibitors (Etanercept in 35% and Adalimumab in 65%) and included in a physiotherapy program of 3 months (3 sessions/week), comprising muscle relaxation, flexibility exercises for cervical, thoracic and lumbar spine, range of motion exercises of coxofemoral joints, muscular strengthening, straight posture and respiratory exercises.
After 3 months, all outcome parameters showed statistically significant improvements ($P<0,05$), as shown in the folliwing table.

		Paired Diffrences	
		Mean	*P* value
Pair 1	BASDAIbaseline – BASDAImonth3	3,44615	0,000
Pair 2	BASFIbaseline – BASFImonth3	2,9654	0,000
Pair 3	OWIbaseline – OWImonth3	1,7125	0,023
Pair 4	SCHOBERbaseline – SCHOBERmonth3	-1,5667	0,000
Pair 5	HIRTZbaseline – HIRTZmonth3	-0,7273	0,001
Pair 6	VASpatient_baseline - VASpatient_month3	4,0833	0,000

Conclusions: According to our results, the combination of physiotherapy and

biological therapy is an effective mean in increasing functional capacity and joint mobility, decreasing disease activity, improving quality of life for AS patients. Currently available data do not adequately address what role physiotherapy may have on patients with AS receiving biological drugs [1]. There are a few studies evaluating the effects of exercises in patients with AS receiving TNFa inhibitors [2,3].

AB1178 A PROSPECTIVE STUDY ON THE EFFECTS OF 3-MONTH COURSES OF TRADITIONAL PHYSIOTERAPY AND YOGA IN PATIENTS WITH CHRONIC ARTHRITIS AND PRIMARY FIBROMYALGIA

C. Nalli[1], L. Andreoli[1], R. Avanzini[2], P. Tipa[2], M. Zanetti[2], C. Milini[3], S. Olivieri[4], E. Abrami[5], R. Furfari[5], R. Gorla[1], A. Tincani[1]. *[1]Rheumatology and Clinical Immunology Unit, Spedali Civili and University of Brescia; [2]Physical Therapy Student, University of Brescia; [3]Rehabilitation Unit, Spedali Civili; [4]Accademia Essse; [5]Associazione Bresciana Artrite Reumatoide (ABAR) Onlus, Brescia, Italy*

Background: Physical activity is of fundamental importance for people with rheumatic diseases (RD). The traditional approach of Physiotherapy (PT) has been placed side by side with other physical programs, such as Yoga (Y), aimed at reducing chronic pain and improving the quality of life.
Objectives: To evaluate the effects of PT and Y on patients with inflammatory and non-inflammatory RD: Chronic Arthritis (CA) and Primary Fibromyalgia (FM).
Methods: Patients were enrolled in a prospective study including 3 months of PT and 3 months of Y (with a specific focus on the control of breathing - *Ai-jutsu*). Each activity was performed bi-weekly in a dedicated facility. Patients were randomly allocated to either the group starting with PT or that starting with Y. After 3 months they switched to the other activity. At the beginning and at the end of each activity patients underwent a medical assessment of their physical status and were proposed questionnaires: 1) HAQ for disability in everyday life; 2) ZUNG self-rating depression scale; 3) Tampa scale for Kinesiophobia assessing the fear and avoidance of movement. Patients with FM compiled also the FIQ for the impact of FM in everyday life. All patients rated their physical pain by VAS (Visual Analogic Scale) from 0 to 10.
Results: Thirteen patients with CA (77% female, median age 62 years, median disease duration 19 years) and 8 with FM (100% female, 56 years, 9 years) participated in the study. At baseline, there were no differences between CA and FM patients in terms of ZUNG, HAQ and Tampa scores. After 3 and 6 months of activity, all items had a tendency toward improvement, with a statistically significant reduction for VAS in both groups (nearly -30%). By intra-group comparison between the beginning and the end of each activity, we observed that patients with CA had a significant reduction of ZUNG and HAQ scores (50 vs 40.5 and 0.600 vs 0.475, respectively) during PT activity, while FM patients had a trend toward the increase of Tampa score (24.5 vs 34.5). During Y activity, significant reductions were observed in VAS score for CA patients (5 vs 2.5) and in Tampa score for FM patients (34.5 vs 23.5). Overall, all items had a tendency toward improvement for FM patients during Y activity.
Conclusions: This pilot study involving both patients with inflammatory and non-inflammatory RD demonstrated benefit from an integrated program of sequential PT and Y and highlighted differences in patients' needs according to their disease type. Particularly, PT seemed to bring more benefit to CA patients, probably because of the individualized work on joint movement range and muscular strengthening, while FM patients may have had a negative impact by this approach, as seen by the increase in the fear of movement. Conversely, FM patients had a tendency toward improvement during Y activity.

AB1179 CAN THE PATIENTS WITH TOTAL KNEE ARTHROPLASTY ACHIEVE DISCHARGE CRITERIA FOR KNEE FLEXION

C. Sevinc, A. Arik, S. Onal, V. Bayrakci Tunay. *Hacettepe University, Ankara, Turkey*

Background: Knee range of motion (ROM) at discharge following total knee arthroplasty is used as a clinical indicator of performance. At least 90 degrees of flexion is standard discharge criteria for many hospitals.
Objectives: To investigate whether the discharge criteria is realistic in patients with TKA.
Methods: 13 patients (11=female, 2=male) who underwent unilateral TKA were included in this study. Mean age was 68.46±7.52 years, mean body mass index (BMI) was 30.14±5.6 kg/m^2. Hospitalization duration was recorded. Knee flexion and extension degree were measured actively with goniometer during heel sliding on discharge day. Oxford Knee Score (OKS) was used to evaluate physical function and pain before surgery. Overall scores ranges from 0 (worst) to 48 (best). Descriptive statistics were used to analyse the data using SPSS v22.
Results: Hospitalization duration was 5.07±1.25 days. Knee flexion degree and knee extension limitation were found 79.15±20.84° and 12.92±7.31°, respectively. Oxford Knee Score was calculated 19±8.30 point. Patients' results were given at Table 1.

Table 1. Patients' results

Patients	Knee flexion degree (°)	Extension limitation (°)	Oxford Knee Score
1	65	11	28
2	98	18	33
3	94	12	15
4	88	10	17
5	100	24	22
6	36	24	14
7	86	12	15
8	70	15	17
9	90	2	12
10	80	10	36
11	42	10	12
12	80	20	10
13	100	0	16

Conclusions: Patients have noticeable extension limitations at discharge. It should follow in the upcoming days. Nearly half of the patients flexed their knee less than expected. Due to the fact that discharge criteria for knee flexion is unrealistic. It should be investigate whether patients with less knee flexion degree can gain function as patients with more knee flexion degree.

AB1180 THE INTENSIVE EXERCISE PROGRAMME FOR NON-RADIOGRAPHIC AXIAL SPONDYLOARTHRITIS AND FOR ANKYLOSING SPONDYLITIS MAY IMPROVED QUALITY OF LIFE AND DISEASE ACTIVITY

M. Husakova[1], K. Pavelka[1], M. Spiritovic[1,2], A. Levitova[1,2]. *[1]Institute of Rheumatology and Department of Rheumatology, First Faculty of Medicine, Charles University, Prague 2; [2]Charles University, Faculty of Physical Education and Sport, Prague, Czech Republic*

Background: The therapy for axial spondyloarthritis (axSpA) is complex. Although anti-inflammatory medication is necessary for axSpA treament, the exercise therapy is required to maintain mobility. The limited data are available to evaluate the effect of exercise therapy on quality of life in axSpA, particularly in patients with the non-radiographic form of the disease (nr-axSpA).
Objectives: To investigated the quality of life in axSpA subgroups, nr-axSpA and Ankylosing spondylitis (AS) in response to intensive rehabilitation programme
Methods: 46 patients with axSpA characterised according to criteria of Assessment of SpondyloArthritis international Society (ASAS) as nr-axSpA (n=23) and AS (n=23) with stable disease and treatment underwent 24 weeks long intervention. The intervention consisted in twice a week outpatient group physiotherapy as exercise units of 60 minutes and a daily home-based exercise programme. All outcomes, disease activity (Bath AS Disease Activity Index, BASDAI and AS Disease Activity Index, ASDAS-CRP) and quality of life (AS quality of life, ASQoL and European quality of life, EurQoL) as well as patients self-reported outcomes such as "patients global assessment" and "pain assessment" were measured at baseline and at the end of exercise program.
Results: Altogether, 41 axSpA patients (AS, n=22 and nr-axSpA, n=19) finished complete six months programme. The disease activity was improved in all axSpA patients (ASDAS-CRP 2.08±0.12 to 1.83±0.11, $p<0.01$), particularly in nr-axSpA subgroup, ASDAS-CRP (1.98±0.19 to 1.71±0.15, $p<0.05$). There were no differences in the changes in ASDAS-CRP and BASDAI over the exercise training between groups (data not shown). After exercise therapy, positive changes of "Patients global assessment", were evaluated by patients of both subgroups, nr-ax-SpA (33.42±5.13 to 23.68±4.11, $p<0.01$) and AS (35.22±3.94 to 25.2±2.92, $p<0.01$). The "assessment of pain during the last 7 days", however, was improved only by patients in the nr-axSpA subgroup (34.74±5.88 vs. 21.05±4.71, $p<0.05$). The quality of life, ASQoL was not changed after rehabilitation programme.

The EurQoL was changed in all axSpA (0.74±0.21 to 0.77±0.18 $p<0.05$), but significantly was improved only in nr-axSpA subgroup (0.72±0.23 to 0.78±0.18, $p<0.01$), not AS. Similarly, the improvement of the assessment of "hodiernal health status" was found after an intervention only in the nr-axSpA subgroup (65.81±21.80 to 78.00±13.77, $p<0.01$).

Conclusions: Our study demonstrated beneficial effect of intensive exercise programme on disease activity and patients self-reported outcomes in nr-axSpA and AS patients. The patients suffering from nr-axSpA can profit at least similarly from the rehabilitation care as those with radiographic form. The exercise programme should be recommended for both subtypes of axSpA.

AB1181 LOCAL STEIOD AND INSULIN INJECTION IN MANAGEMENT OF CARPAL TUNNEL SYNDROME; A COMPARATIVE STUDY

M.H. Abu-Zaid, S. El morsy, S.A. Hablas. *Rheumatology and Rehabilitation, Faculty of Medicine Tanta University Egypt, Tanta, Egypt*

Background: Carpal tunnel syndrome (CTS) is the most common focal nerve entrapment; local corticosteroid (CS) injection has been widely used to treat CTS. Recently; Local insulin Injection in CTS has been studied as insulin has anti-inflammatory anti-edematous effects.

Objectives: To compare the effectiveness of local steroid and insulin injections in management of CTS

Methods: Forty patients complaining of mild or moderate idiopathic CTS (diagnosed clinically & electrophysiologically and classified according to American association of neuromuscular diagnostic medicine monograph) divided into 2 equal groups.

Group I received two local injections of 10 IU NPH insulin into the affected carpal tunnel 2 weeks intervals. Group II: received single injection of triamcinolone acetonide (20 mg/0.5 ml) all procedures done after informed consent. Patients with severe or secondary type of CTS were excluded from this study. Evaluation of the patients was done at baseline, 2 and 4 months later clinically by measuring visual analogue scale (VAS), Phallen and compression tests and electrophysiologically by measuring motor and sensory nerve conduction studies of median and ulnar nerves using a standardized technique.

Results: There was significant improvement in all clinical parameters in both groups after 2 and 4 months from injection ($p<0.01$) including VAS, Phallen and compression tests with more improvement was noticed in group I. Also there was significant improvement in electrophysiological parameters such as distal motor latency (DML) and distal sensory velocity of median nerve 2 and 4 months after treatment ($p<0.01$).However the improvement was more in group I but the difference between results in both groups were statistically nonsignificant.

Table 1. clinical and electrophysiological results

	Before injection		After 2 months		After 4 months	
	Group I	Group II	Group I	Group II	Group I	Group II
VAS	7.1±1.03	7.25±1.377	4.05±1.23	5.107±1.57	3.2±1.39	3.75±1.878
Positive Phallentest %	100	95	60	60	30	35
Positive compression test%	100	100	60	65	30	30
DML (ms)	4.61±0.34	4.63±0.569	4.375±0.37	4.405±0.51	4.15±0.14	4.18±0.548
Distal median nerve sensory velocity (m/s)	32.9±5.32	32.8±4.78	36.9±6.21	36.05±5.3	39.9±5.39	39.11±6.146

Conclusions: Local insulin injection is as effective as (or even better than) local steroid injection in management of CTS

AB1182 THE ROLE OF VITAMIN D AND EXERCISES IN CORRECTION OF AGE-RELATED SKELETAL MUSCLE CHANGES IN POSTMENOPAUSAL WOMEN

V. Povoroznyuk, N. Dzerovych, N. Balatska, A. Belinska, R. Povoroznyuk. *D.F. Chebotarev Institute of Gerontology Nams Ukraine, Kyiv, Ukraine*

Background: The aim of the study was to evaluate the role of vitamin D and exercises in correction of age-related skeletal muscle changes in postmenopausal women.

Objectives: 38 postmenopausal women aged 53–82 years (mean age – 67.00±7.08 yrs; mean height – 160.31±6.83 cm; mean weight – 63.25±8.59 kg, body mass index – 24.62±3.09 kg/m^2) were examined. All subjects were free of systemic disorders (endocrine, renal, hepatic etc.) and did not take any medications known to affect skeletal and muscle metabolism. The women were divided into the following groups: A – control group (n=10), B – women who took an individually-targeted vitamin D therapy (n=11), C – women who took an individually-targeted vitamin D therapy and OTAGO Exercise Programme (http://www.hfwcny.org/Tools/BroadCaster/Upload/Project13/Docs/Otago_Exercise_Programme.pdf) during 12 months.

Methods: The assessment of the examined women was conducted every 3 months at the medical center. We used the following questionnaires: SARC-F, IADL-questionnaire, frailty scale, Desmond fall risk questionnaire. For evaluation of skeletal muscle function and strength, we assessed the usual gait speed and used hand dynamometry. 25(OH)D total and iPTH levels were measured by electrochemiluminescent method i.e. Elecsys 2010 analytical system (Roche Diagnostics, Germany) and test-systems cobas. The lean mass was measured by the DXA method (Prodigy, GEHC Lunar, Madison, WI, USA). "Statistika 6.0" © StatSoft, Inc. was used for the data processing purposes.

Results: At the baseline, the groups of examined women did not differ in their age, anthropometric characteristics, 25(OH)D values, data of skeletal muscle mass, strength and function. In women of the control group, the mean 25(OH)D level significantly increased after 9 months of observation (9 months – $p=0.03$) purportedly due to the seasonal factors. In women of 2nd and 3rd groups, the 25(OH)D level significantly increased after 3, 6, 9 and 12 months of observations (2nd group: 3 months – $p=0.009$, 6 months – $p=0.007$, 9 months – $p=0.005$, 12 months – $p=0.003$; 3rd group: 3 months – $p<0.001$, 6 months – $p<0.001$, 9 months – $p<0.001$, 12 months – $p<0.001$). The data of SARC-F, IADL-questionnaires did not change during 12 months of observation in women of 1st and 2nd groups; however, in the 3rd group the SARC-F data significantly decreased after 12 months ($p=0,02$) while the IADL data – significantly increased after 9 ($p=0.04$) and 12 months ($p=0.05$). The data of frailty scale and Desmond fall risk questionnaire did not differ in all groups during 12 months. The muscle strength significantly increased after 9 months ($p=0.01$) in women of 3rd group while in women of 1st and 2nd group this parameter did not change. The usual gait speed and lean mass assessed by DXA did not change in all groups during 12 months. The fall frequency in women of 1st group significantly increased after 12 months, in women of 2nd group it did not change while in women of 3rd group the fall frequency significantly decreased.

Conclusions: Using individually-targeted vitamin D therapy and OTAGO Exercise Programme during 12 months significantly improves daily activity, muscle strength and decreases the fall frequency in postmenopausal women.

Education

AB1183 PATIENT'S EDUCATION IN THE ADMINISTRATION OF SUBCUTANEOUS DRUGS IN THE RHEUMATOLOGY DAY-CARE HOSPITAL UNITS

A. Erra, A. Fagil, L. López. *Rheumatology, Hospital San Rafael, Barcelona, Spain*

Background: Rheumatology Day-Care Hospital Unit (DHU) is defined as a hospital care for a few hours with the objective to do diagnosis, clinical trials and/or multiple test, patient education and treatments that cannot be done in the outpatient clinic, but which do not justify the complete stay in the hospital

Objectives: Analyze the number of visits that one patient needs in the Rheumatology-DHU to learn the self-administration of a subcutaneous drug.

To evaluate if there are differences between the numbers of visits made in Rheumatology-DHU for the different drugs, and between the different age groups of the patients.

Methods: All patients who were prescribed a subcutaneous drug (except denosumab) during the period January 2015 - December 2016 were referred to Rheumatology-DHU. The nurse gave instructions, she supervised the patient's learning and she decided if the patients needed a new control in Rheumatology-DHU.

The following data were recorded: sex, age, diagnosis, drug, number of visits each patient made in Rheumatology-DHU, reason for new visit to Rheumatology-DHU in patients who had already been discharged and adherence to treatment.

Results: 101 patients were visited in Rheumatology-DHU (8 were referred twice for education of different drugs). 79 were women (78%) and 22 men (22%). Mean age (MA) of 65 +/- 17 years (SD).

Diagnosis MA/SD	MTX	PHT	GOL	ETA	ADA	CER	ABA	SECU	Total
Rheumatoid arthirits 62±16	30	0	2	4	2	1	2	0	41
Psoriatic arthritis 52±17	9	0	5	1	1	1	0	1	18
Anquilosing spondilytis 48±12	1	0	2	2	3	2	0	0	10
Osteoporosi 79±7	0	40	0	0	0	0	0	0	40
Total (%)	40 (37%)	40 (37%)	9 (8%)	7 (6%)	6 (6%)	4 (3%)	2 (2%)	1 (1%)	109

MTX: methotrexate PTH: teriparatide GOL: golimumab ETA: etanercept ADA: adalimumab CER: certolizumab ABA: abatacept SECU: secukimumab SD: standard deviation.

A total of 238 visits were made in Rheumatology-DHU.
Adherence to treatment was 98.2%.
Six patients (5.5%) required a new referral to Rheumatology-DHU: 1 for poor adherence to treatment (ADA), 3 for skin lesions (2 MTX and 1 GOL), 2 supervise the treatment (1 CER and 1 MTX).
In 9% of the patients, the education was done to a reference person and not to the patient himself.
The number of visits in the Rheumatology-DHU were: 1 in 26 patients (MS of 66 +/- 19.6 years), 2 in 59 patients (MS 65 +/- 18); 3 in 13 patients (MS 64 +/- 13); 4 in 6 patients (MS 67 +/- 14); 5 in 2 patients (MS 68 +/- 17), 6 in 2 patients (MS 70 +/- 22), 9 in 1 patient (47 years).
We analyzed PTH and MTX groups (because they had the highest number of patients) and we observed that in the PTH group 82% required ≤2 visits, 18%> of 2 visits. Patients in MTX group: 77% ≤2 visits and 23%>2 education visits. There weren't significant differences between the two groups (p=0.576).
Conclusions: Adherence to treatment in patients who are referred to Rheumatology-DHU to learn the self-administration of a subcutaneous drug is very high.
The new visits in Rheumatology-DHU for doubts or side effects were few.
Patients on PTH treatment, who were older, didn't require a higher number of visits or more new referrals to Rheumatology-DHU. Therefore, age is not a limiting factor for the right learning of patients.
The patient's education by nurse in Rheumatology-DHU is necessary for the right control of our patients

AB1184 EDUCATIONAL NEEDS OF PATIENTS WITH RHEUMATIC DISEASES RECEIVING BIOLOGICS

A.T. Kotulska[1], E.J. Kucharz[1], P. Wiland[2], M. Olesinska[3], A. Felis-Giemza[3], M. Kopec-Medrek[3], W. Romanowski[3], L. Szymczak-Bartz[3], M. Tlustochowicz[3], J. Lewandowicz[3], J. Kowalska-Majka[3], J. Bucka[3], M. Majdan[3], Z. Kielbik[3], M. Korkosz[3], A. Bielinska[3], P. Leszczynski[3], K. Pawlak-Bus[3], M. Puszczewicz[3], M. Majewski[3], K. Smolik[3], T. Migas-Kukla[3], M. Sochocka-Bykowska[3], M. Szarecka[3], B. Luberda[3], M. Falenta-Hitnarowicz[3], J. Swikszcz-Gniadek[3], W. Lepiarz-Rusek[3], G. Rozwadowski[3], B. Chara[3], J. Zajdel[3], Z. Zdrojewski[3], I. Rosmus-Kuczia[3] on behalf of Research Group of the Polish Society of Rheumatology. *[1]Internal Medicine and Rheumatology, Medical University of Silesia, Katowice; [2]Rheumatology and Internal Medicine, Medical University of Wroclaw, Wroclaw; [3]Research Group of the Polish Society of Rheumatology, Katowice, Poland*

Background: Biologics are still considered by patients as a new and partially enigmatic tool for management of rheumatic diseases.
Objectives: The study was designed to evaluate educational needs and sources of knowledge in patients with rheumatic diseases treated with biologics.
Methods: Anonymous questionnaires were distributed in 23 Polish rheumatological centers involved in the treatment, 1231 questionnaires were used for analysis. Responses were received from 606 patients with rheumatoid arthritis, 427 with ankylosing spondylitis, 117 psoriatic arthritis, and 62 adult patients with juvenile idiopathic arthritis (in whom administration of the drugs had been introduced before they were 18-year-old), as well as 19 ones receiving the drugs due to other musculoskeletal disorders. The investigated group constituted about one-fifth of all rheumatic patients on biologics in Poland.
Results: Almost all the patients had learnt for the first time on biologics from their rheumatologist (93%). Few only patients had got such data from internet or from other patients. Likewise, most of the patients got majority of educational data on treatment with biologics from rheumatologist who was supervising the therapy (82%). Remaining sources included internet (8%) and other patients (5%). Relative low number of patients was educated by nurses (2%). Most of the patients (87%) were looking for more details on biological treatment. The patients with rheumatic disease lasting less than 10 yrs. were more interested in the management than those suffering longer. Most of the patients (94%) considered their rheumatologist as the main person responsible for their education on biologics. There was no difference between patients with various rheumatic diseases as well as no difference was found between female and male patients. Biological treatment attracted more interest in younger than older patients.
Conclusions: Education is still a challenge in patients receiving biologics. Most of the patients represented traditional attitude to health education, expecting almost all educational data to be provided by their physician. We were surprised that role of the nurses was found to be rather low. An increase in role of nurses seems to be the future aim of the educational efforts in Polish rheumatology.

AB1185 REAL-LIFE EXPERIENCE AND MUTUAL EXPECTATIONS OF PATIENTS AFFECTED WITH CHRONICAL INFLAMMATORY RHEUMATIC DISEASES AND THEIR RELATIVES; CONSEQUENCES IN PATIENT EDUCATION: A QUALITATIVE STUDY BY THE PROXYRIC GROUP OF THE PATIENT EDUCATION DIVISION OF FRENCH RHEUMATIC DISEASE SOCIETY

D. Poivret[1], A. Untas[2], E. Boujut[3], C. Vioulac[2], C. Delannoy[4], L. Carton[5], N. Legoupil[6], G. Hayem[7], S. Pouplin[8], A.-C. Rat[9], J.-S. Giraudet-Le Quintrec[6], C. Beauvais[10]. *[1]Chr Metz Thionville, Metz; [2]Institut psychologie Paris Descartes, Paris; [3]Institut psychopathologie et processus de santé, Versailles; [4]Cabinet Psychologie; [5]AFLAR; [6]Service Rhumatologie A, hôpital Cochin, Paris; [7]Service Rhumatologie, Hôpital Ambroise Paré, Boulogne Billancourt; [8]Service Rhumatologie, CHU, Rouen; [9]Service Rhumatologie, CHU Brabois, Nancy; [10]Service Rhumatologie, CHU Saint Antoine, Paris, France*

Background: Interaction with relatives has a significant role on patients' health, and can also impair relatives'health. Education processes need codification to enrole relatives in the programms.
Objectives: To create a patient education program for relatives and patient affected by rheumatic inflammatory desease
Methods: Individual semi-directed by 2 psychologists interviews, have been performed and their thematic content analysed with the QDA Miner program. A guide had been achieved by rheumatologists, psychologists et patient association representatives. The (patient/relative) dyad, has been first questioned together, and then individually.
Results: 20 patients, average age 59 years (27–79) affected with Rheumatoïd Arhritis (n=13), Spondyloarthritis (n=9) with an average disease duration of 12,8 years (1–39) and one of their relatives (being their spouse in 18 cases) have been recruited in 7 rheumatology departments in France. Common life duration was 27,5 years as an average (1,5–57). About 2/3 of patients and relatives have a common view on: relative's role in bringing an emotional support but needs a knowledge on disease and treatments; emotional distress experienced by both patient and relative; the worrries and reative's feelings of not knowing how to to do; the help brought by the relative in everyday's life and his participation to care management. Only a few relatives talked about concerns, regrets of past life, and burden feeling of patient. Relatives also express unfairness feelings. 2/3 of patients and relatives report will of independence of the patient, who wants to manage alone, and does not express his difficulties. 50% of relatives think they anticipate patient's needs, they are also directly resquested by the patients. On the other side, the patients often report that they watch over relative's health. 50% of patients and relatives mention the idea of complementarity and " team ", but also tensions or conflicts. Patient Education contribution would be sharing and exchanging between them, according to 2/3 of patients and relatives, who therefore would prefer group education (12/20). Relatives however more often mention a common education with patient, and patients prefer a separate education of relative. The main limit to of this study is that participation to study has favored harmoniously functioning dyads, what may explain the weak rate of abandonment feeling.
Conclusions: Expectations on relatives' role seem to be common in terms of practical and emotional support. Relatives sometimes mention the "positivation" of their role, but also emotional distress and helplessness feeling. Patients fear they are a burden and want to be independent. A specific educational management of relatives is more often suggested by patients than by relatives.

AB1186 OPTIMISATION OF RHEUMATOLOGY UNDERGRADUATE TEACHING: SELF-DIRECTED DEVELOPMENT OF POWERPOINT PRESENTATIONS BASED ON THEORETICAL CLINICAL CASES

F.A.H. Cooles[1,2], R.L. Batten[1], J. Stewart[1], D. Coady[1]. *[1]City Hospitals Sunderland NHS Foundation Trust, Sunderland; [2]NIHR Newcastle Biomedical Research Centre based at Newcastle upon Tyne Hospitals NHS Foundation Trust and Newcastle University, Newcastle Upon Tyne, United Kingdom*

Background: One element of rheumatology undergraduate teaching in City Hospital Sunderland, UK traditionally involves "paper cases" delivered via small group learning and discussion. Although popular it has had poor feedback from both the students and the tutors at times especially when the tutor to student ratio is high (>1:6). With limited numbers of tutors (Consultant Rheumatologists), this issue was becoming more frequent.
Objectives: We wished to explore alternative yet still interactive methods to highlight key learning points relating to common rheumatological conditions in a 60 minute teaching session and to make this fun and engaging.

Methods: 30 undergraduate medical students (January 2017) were given modified teaching material for a 60 minute teaching session a week later. This material involved a partially populated Microsoft Powerpoint slideshow including prompts about a theoretical patient's clinical case in the notes section. This guided development of a clinical case presentation which covered diverse aspects of clinical care, e.g. imaging, extra-articular disease, drug side effects and disease activity scores. Clinical cases addressed systemic lupus erythematous, early rheumatoid arthritis (RA), ankylosing spondylitis and established RA. Students (groups of 2–3) received one case each were encouraged to use images and online teaching repositories to enhance their presentation. This provided the framework for a 20 minute teaching presentation which was given to their student peers at a formal teaching day 1 week later. A tutor was also present during these sessions (with a ratio of 1:10) to ensure adequate understanding of topics had been achieved and to answer any questions. Feedback was sought from the students and compared with previous "paper case" (non-modified) sessions.
Results: Feedback obtained (n=9) showed 55% of students rated the modified teaching session as "excellent" with the remainder rating it as "good". Free-text comments included "good to have students to do the presentations so they cover relevant points" "very useful to have a quick 20 minute overview of different conditions & preparation was useful" and "lots of learning, interactive". Additional comments included the wish for more time to cover the points in even more depth. Informal feedback from the tutors of these events was also favourable with tutors believing students had a developed a greater depth of understanding. These findings compared favourably with the previous years "paper-case" feedback (March 2016, n=13) where only 23% (n=3) of students had rated the session as "excellent" as well as free text comments emphasising wishes for more time to read through cases and smaller group discussion.
Conclusions: Current "paper based" modalities can easily be utilized and "re-purposed" to optimize both self-directed and formal teaching components of undergraduate teaching. This can promote the understanding of complex rheumatological learning points in a relatively short period of time and allow students exposure to modalities, such as imaging, which may previously be excluded in a traditional "paper case" format.

AB1187 SURVEY ON GENERIC DRUGS (GE) AND BIO-SIMILAR DRUGS (BIO-S) OF PATIENTS WITH RHEUMATOID ARTHRITIS (RA) AND THEIR DOCTORS - COHORT STUDY OF THE JAPANESE CLINICIAN BIOLOGICS RESEARCH GROUP

K. Funahashi[1], T. Yoshitama[2], T. Tetsu Oyama[3], A. Sagawa[3], K. Katayama[3], T. Matsubara[3], N. Nishimoto[3], S. Kiyokawa[3], N. Miyake[3], A. Akihiko Nakamura[3], M. Oribe[3], T. Tomohiko Yoshida[3], T. Mitsuka[3] on behalf of Japanese Clinician Biologics Research Group. *[1]Clinical Research, Matsubara Mayflower Hospital, Kato, Japan; [2]Japanese Clinician Biologics Research Group, Kobe, Andorra; [3]Japanese Clinician Biologics Research Group, Kobe, Japan*

Background: In Japan in 2014 the market share for generic drugs was 50%, lower than that of Western nations, but the reasons why the patients themselves turn down the opportunity to switch to a generic drug when asked at the pharmacy are not clear. In addition, the use of bio-similar drugs became possible in Japan in 2015, but the degree of knowledge that patients have regarding them is unknown.
Objectives: Therefore we carried out a patient survey about generic and bio-similar drugs, and at the same time, we also conducted a questionnaire for doctors who prescribed them, and conducted a comparative study of patient's and doctor's awareness regarding these drugs.
Methods: The survey was carried out amongst 4151 patients being treated at 20 research group member facilities. It was an anonymous written survey. After the section on patient background (age, gender, disease history) was completed, patients were asked their impressions of generic drugs, their attitudes towards changing to a generic, whether or not they had ever experienced an adverse effect with a generic drug, what knowledge they had regarding bio-similar drugs, and if they had any interest in or experience with using bio-similar drugs.We also asked 32 physicians about permissions and restrictions on GE use, negative experience of GE, problems of GE, experience of BIO-S and future plans for use, conditions of BIO-S usage, etc.
Results: The group was 78% female, the majority of whom were in their 60's, and most had disease history of more than 10 years. Those with a good impression of GE drugs comprised 41%, those with a bad impression 9.4%. 34% of patients had switched to GE drugs, those who would not or could not were 24%. Those who reported a bad experience (lessening of effectiveness, or an adverse effect) were 8%.Meanwhile, in GE survey of doctors, about 65% partially restricted the use of GE, and about 70% had experiences of weakening of effects and occurrence of adverse events when using GE. Regarding patient knowledge of BIO-S, 13% knew of them, and 44% replied that they had no interest in them, even after being shown explanatory materials about the drugs. 63% of patients said they would rely on their physicians's judgement regarding choosing BIO-S drugs, with 10% stating they would choose BIO-S based on cost benefits. On the other hand, approximately 40% of physicians have experience using BIO - S, while about 60% have experience explaining them to patients. About 60% replied that they plan to use BIO-Ss to be released in the future but on the condition of regular and detailed provision of safety information.
Conclusions: Due to experience in using GE, physicians wish to receive detailed information on individual drugs, and desire it even more in the case of BIO-S drugs. RA patients with RA have received little information on BIO-S, and this can be thought to be a direct result of lack of information for prescribing physicians.

AB1188 WHAT IS THE VALUE OF RHEUMATOLOGY ON-CALL SERVICE? AN EVALUATION OF ACUTE RHEUMATOLOGY ON-CALL SERVICE IN A TERTIARY CENTRE

L.H. Lee, A. Gupta. *Nottingham University Hospitals NHS Trust, Nottingham, United Kingdom*

Background: Rheumatology is largely an outpatient specialty. Changes in healthcare structure in recent years have seen a trend for increased demand for specialty input in acute inpatient care. However, financial pressures on the other hand have led to calls to curtail specialty on-call service. Service provision apart, "being on-call" has traditionally been seen as an important educational experience, equipping registrars with valuable acute rheumatology skills. Despite all these, there is little published literature evaluating the contribution and workload of Rheumatology on-call service.
Objectives: This study sought to evaluate the contribution of Rheumatology on-call service as well as to assess the spectrum of conditions referred.
Methods: An electronic database was created to record details of on-call referrals received by one Rheumatology specialty registrar in a tertiary hospital. These included relevant clinical details, outcomes of referral and working diagnosis.
Results: A total of 40 referrals were recorded over 9 days in a 5-week period from December 2016 to January 2017. Seventeen referrals were reviewed on the same day by the rheumatology registrar. Referrals from medical wards comprised 10 out of 17 referrals reviewed. Other sources of referrals were Emergency Department, General Practitioners and Rheumatology advice phone line with 4, 2 and 1 referrals respectively.
Of the 17 patients reviewed on-call, 11 referrals (65%) could be classified in the category of "acute hot joint", 2 were in the category of vasculitis and connective tissue disorders, 2 were predominantly mechanical problems, 1 was referred with a painful limb while 1 had an elevated creatine kinase. Thirteen of these 17 patients required an arthrocentesis, 12 of which were either performed or supervised by the rheumatology team. Septic arthritis was diagnosed in only one patient. Three of the 17 patients had musculoskeletal ultrasound scan performed by the rheumatology team on the same day.
Conclusions: Rheumatology on-call service provides a significant contribution to acute care which cannot be substituted by other specialties. It also continues to provide rheumatology trainees with experience in acute rheumatology although it could be argued that the spread of conditions seen were skewed toward acute hot joints and that exposure to connective tissue disorders and vasculitis was limited. The results of this study have important implications for planning and delivery of postgraduate Rheumatology training curriculum and delivery of on-call Rheumatology service.

AB1189 "GO TRANS": OUTCOME OF THE PROGRAM OF WORKSHOPS FOR ADOLESCENTS WITH RHEUMATOLOGICAL DISEASES

M.A. Blázquez[1], A. Boteanu[1], L. León[2], S. Lerma[3], M. Vázquez[1]. *[1]Hospital Universitario Ramón y Cajal; [2]2 Idissc, Hospital Universitario Clínico San Carlos Madrid; [3]Hospital Niño Jesús, Madrid, Spain*

Background: Transition is the process by which a young patient with a chronic disease is able to develop skills and have access to resources to ensure that physical, psychological, educational and vocational needs are covered during the stage from youth to adulthood. According to SERPE and EULAR/PReS recommendations, the goal of transition programs is to improve the support to patients during this process, mainly working in multidisciplinary teams.
Objectives: Our main purpose was to accomplish self-care, illness awareness, stress management and negative emotions workshops focused in improving their life quality.
Methods: Workshops are conducted by a psychologist, a pediatric physiotherapist, two rheumatologists and a rheumatology nurse at our center. It consists of a total of 7 workshops (first six for patients and the last for parents). Five of these workshops are based on HEADSS system (home, education, activities, drugs, sexual activity, and emotions) and the two others are focused on disease and treatment consciousness. Parents signed an informed consent document. Workshops lasted 90 minutes in sessions outside of the consultation hours. At baseline, several questionnaires were completed, VAS pain (parents and patients), VAS general (parents and patients), JAMAR (parents and patients), PedsQL 4.0, those questionnaires were also completed after 3 months together with a satisfaction survey.
Results: A total of 12 patients were included, with ages between 11 to 16 years old, with an average of 14 years old. A total of 10 patients completed 100% of the program (6 girls and 4 boys). 6 patients had AIJ (oligoarticular, enthesitis-related arthritis, psoriatic arthritis), 3 suffered from LES and 1 had Behçet. All patients

were under immunosuppressive therapy and 60% of them received biological treatment. 20% of patients had clinical activity data. The average of global VAS was 12 (0–100) and the average of VAS pain was 0.9 (0–100). The average of initial PEDSQL 4.0 was 80.7 (0–100) and the PEDSQL 4.0 at three months was 74.4. At the end of the workshops, 100% of parents and patients would recommend other patients to attend it, more than 50% of patients think that they would be able to go to medical visits without their parents and 90% of them would take responsibility for their treatments. A 90% of patients think that workshops have helped to improve their relationship with their rheumatologist and 60% of them have improved their knowledge about the disease. Regarding to physical activity leves, 30% of the patients have increased it compared to baseline. More than 50% of parents have observed a positive attitude change towards the disease after the program.

Conclusions: Transition programs are important for the transfer to be effective throughout the involvement of adolescent, who takes responsibility for his/her disease and also to ensure their psychosocial needs are met. Rheumatologists must be ready to cover these needs with the support of other specialists. Our experience with the program was very positive since most of the patients improved their knowledge about the disease and its autonomy concerning their medical consultations and treatments, being very satisfied with the contents of the workshops.

AB1190 BEHAVIOR AND TRENDS IN COLOMBIAN PATIENTS WITH RHEUMATIC DISEASES RELATED TO THE TECHNOLOGICAL TOOLS IN CONSULTATION OF RHEUMATOLOGY

M.C. Latorre [1], A.M. Ocaña [2]. *[1]Reumatologia, Country Medical Center; [2]Electronic Engineering, Octesoft, Bogota, Colombia*

Background: In the last decades the internet has changed the way of communication with patients using email, social media and other technological tools, as a complement to the consultation. The development of websites and electronic history are part of these tools that have come to change communication with the patient.

Objectives: To analyze the behavior and trends of Colombian patients with rheumatic diseases related to use electronic tools.

Methods: We analyzed 425 patients between September 2015 and December 2016, who attended to consultation at Country Medical Center. Everyone was provided the website http://www.dra-mconstanzalatorre-reumatologa.com/. This website was developed by Octesoft (http://www.octesoft.com/), company specialized in development website and software. In this website have general information the clinic, access, schedules, glossary, news, medical information and can request online appointment

Results: We included 425 patients with rheumatic diseases, 85.5% female, with an average age of 52.5 years old. 95% lived in urban areas. 92% had internet access. 80% had smart phone. They were stratified by educational level, finding that 70% had college level. And by age groups it was found that patients between 30 and 50 years old in 72% of cases used the electronic way to request the appointment or ask questions. Patients between 18 to 29 years old prefer social media. Patients over 60 years of age preferred to use the telephone. The reasons for using the online appointment were: easy access at any time 84% tool speed 10%. Difficulty for the use of the telephone at work 2%. Others 4%. When patients communicate via email 90% of the questions are related to requesting the appointment.

During this period the website had 3860 views. With a progressive increase from 60 to 538, with an average of 227, with the highest number of visits between November and December. The patients showed satisfaction with the use of technological tools by 89%.

There is no relationship with the use of technological tools with other factors such as gender, rheumatic disease, other diseases or job.

Conclusions: In this study we find that patients gradually and progressively adopt the use of other tools for communication different from conventional, such as web site or email in the request of their appointments and in the communication with rheumatologist. We found that the main factors for adopting these changes are the group of age, especially between 30 to 50 years old and the level of education, when the level of study is university, tend to use on-line communication. It is important to give different alternatives of communication to patients according to their characteristics.

AB1191 ANALYSIS OF FACTORS RELATED TO THE LEARNING OF RHEUMATOLOGY BY TRAINING DOCTORS OF OTHER SPECIALTIES

M.A. Belmonte-Serrano [1], P. Tejón-Menendez [2], J.A. Castellano-Cuesta [3], N. Fernandez-Llanio [3], P. Bernabeu [4], V. Jovaní-Casado [5], J. Rosas Gomez-Salazar [6], F. Navarro-Blasco [7], A. Ybañez-Garcia [8], A. Lozano-Saez [9] on behalf of Reumeval working group. *[1]Reumatología; [2]Hospital General de Castellón, Castellón de la Plana; [3]Reumatología, Hospital Arnau de Vilanova, Valencia; [4]Reumatología, Hosp San Juan; [5]Reumatología, Hosp General; [6]Reumatología, Hosp Marina Baixa, Alicante; [7]Reumatología, Hosp General, Elx; [8]Reumatología, Hosp Peset, Valencia; [9]Reumatología, Hospital General, Castellón de la Plana, Spain*

Background: Many doctors in training of other specialities make a monthly rotation in the rheumatology unit, but usually no formal assessment of the skills and knowledge acquired is performed.

Objectives: To know which factors are related to learning of Rheumatology skills by training doctors (MIR) of other specialties rotating in spanish Rheumatology units.

Methods: An online platform for the evaluation of the knowledge of Rheumatology has been developed (REUMEVAL, see www.reumeval.com). It contains a set (DB) of 300 multiple-choice questions developed by staff rheumatologists on 10 topics of general interest. The set questions passed a Delphi round and 15% of them were replaced by more appropriate ones.

Each MIR that goes to perform a rotation in a teaching Rheumatology Unit (REU) is offered to participate with two tests of 30 questions randomly extracted from the DB. The first test is done just arriving at REU, assessing the basic knowledge that was obtained in the university. At the end of the rotation in REU, usually 30 days, a second test is performed, assessing the increase of knowledge achieved.

Results: As of December 2016, 384 tests were carried out by 216 physicians training in 14 hospitals of the Valencian region in Spain Of these, 166 (77%) completed both tests. 74% were in training for family medicine (MFC). The mean score of the 1st test was 5.59 (out of 10 points), and the second test was 6.55 points, with an average increase of scorings of 22.4% ($p<0.001$). Men showed higher scorings than women in their 1st test (5.92 vs 5.56), but the difference was lost in the 2nd test (6.79 vs 6.47). Younger residents (ages 20–30 years) had a 1st higher score than those aged 30–40 or$>$40 years (5.8 vs 5.2 vs 5.1 respectively) but were similar in the 2nd test (6.6 Vs 6.3 vs. 6.8). By nationality, Spaniards had higher initial scores than foreigners (5.78 vs 4.91, $p<0.01$) but there were no differences in the second test (6.55 vs 6.49). For specialties, dermatology, internal medicine and RHB had initial scores higher than MFC (7.3 - 6.1 - 6.3 vs. 5.4), but in the second test there were no significant differences.

Conclusions: The level of knowledge in Rheumatology of the residents who start a training rotation in this specialty is moderate, with an average of 5.59 points out of 10 possible. At the end of the rotation their scores increased an average of 22%, which shows a significant improvement but still not very high. Several factors were related to basic knowledge scores but lost significance in the final test, reflecting appropriate improvements in knowledge in all subgroups.

AB1192 NATIONAL BAROMETER TO ASSESS THE EMOTIONAL ASPECTS OF PATIENTS WITH RHEUMATOID ARTHRITIS. OPINAR PROJECT

S. Castañeda Sanz [1], M.A. Gonzalez-Gay [2], E.F. Vicente [1], C. Alegre de Miguel [3], M. De la Hera [4], V. Torrente-Segarra [5], L. Merino-Meléndez [6], A. Juan-Mas [7], L. Alcaide [8,9], A.I. Torralba [9], J.L. Baquero [10]. *[1]Rheumatology, Hospital de la Princesa, Madrid; [2]Rheumatology, H. Marques de Valdecilla, Santander; [3]Rheumatology, H U Quirón-Dexeus, Barcelona; [4]Rheumatology, Clínica Mompía, Cantabria; [5]Rheumatology, H U Hospitalet-Moisès Broggi, Barcelona; [6]Rheumatology, H General San Pedro, Logroño; [7]Rheumatology, H U Son Llatzer, Palma de Mallorca; [8]Rheumatology, ConArtritis; [9]Rheumatology, Coordinadora Nacional de Artritis; [10]Scientia Salus, Madrid, Spain*

Background: The WHO defines health as the state of physical, psychic and social well-being. In contrast, patients with rheumatoid arthritis (RA) frequently report that treatment is directed mainly at combating physical affection and hardly anything to emotional and social aspects.

Objectives: To assess the emotional impact and degree of satisfaction with the medical care received in the patient with poor prognosis RA.

Methods: National, structured and anonymous survey of 26 questions conducted between March and July 2016. Responses were counted as percentages or as means/medians of the score given on a Likert scale from 1 to 10 (minimum and maximum, respectively). Analyzes were performed using Microsoft 2012: mean (m), standard deviation (SD), median (M), interquartile range (IQR) and statistical significance of differences (Student *t* test). The study was approved by the National Coordinator ConArtritis and the CEIC of the reference hospital.

Results: The survey was completed by 100 of 122 enrollees, 75 by telephone and 25 via email; 83 women and 17 men, with a mean age of 49.4 years (SD 12.1); from all the Spanish Autonomous Communities. 52% were considered of poor

prognosis (participant's own perception). 66.7% of self-perceived high-activity RA by patients exceeded the physician's impression; and 31.03% of the intermediate-activity. The degree of knowledge and the importance given to certain aspects of the disease in relation to the poor prognosis ranged from 8 to 9/10 in the different items analyzed. The awareness of their seropositivity against FR and ACPA was 77% and 17%, respectively. 63% consider the physical aspect more disabling, but 52% gave more value to feeling good emotionally. The mean treatment score for physical aspects was 7.07 (SD 2.52), whereas for emotional aspects was 3.39 (SD 2.57). 51.9% of self-considered poor prognosis patients believed that biological treatment was delayed and 50% related that to poorer outcome. 97% wanted to participate in the doctor's decisions, but 38% declared they had no choice. There were no statistically significant differences between the prognostic groups.

Conclusions: More than half of the patients self-reported poor prognosis. Two-thirds estimated poorer health status than physicians if their RA was of high activity; 1/3 if it was intermediate. Patients considered all assessed aspects as determinants of poor prognosis (m>8). The degree of knowledge of their condition was high, being lower for joint damage and activity and prognostic markers. The beginning of treatment with biologicals was perceived as delayed in more than half of those who declared themselves with poor prognosis and half of them related it to a worse evolution. A high percentage of patients showed low satisfaction with the emotional attention received. Most claim to be more involved in medical decisions, although more than 1/3 does not seem to be able to do so.

AB1193 DEVELOPING THE KOREAN EDUCATIONAL NEEDS ASSESSMENT TOOL (KOREAN-ENAT) IN RHEUMATOID ARTHRITIS: A CROSS-CULTURAL VALIDATION USING RASCH ANALYSIS

Y.-K. Sung[1], D. Kim[1], S.J. Cha[1], D. Yoo[1], S.-H. Kim[2], M. Ndosi[3], S.-K. Cho[1]. *[1]Department of Rheumatology, Hanyang University Hospital for Rheumatic Diseases, Seoul; [2]Department of Measurement and Evaluation of Physical Education, Chungbuk National University, Cheongju, Korea, Republic Of; [3]Centre for Health and Clinical Research, University of the West of England, Bristol, United Kingdom*

Background: The Educational Needs Assessment Tool (ENAT) is a 39-item patient-completed questionnaire designed to help patients identify and prioritize their educational needs. It was originally developed in the UK and validated in 7 rheumatic diseases including rheumatoid arthritis (RA).[1]

Objectives: This study aimed to undertake cross-cultural adaptation and validation of the ENAT in RA for use in Korea.

Methods: The study involved two main phases: (1) Cross-cultural adaptation of the ENAT from English into Korean and (2) validation of the Korean-ENAT. The first phase followed an established process of cross-cultural adaptation of self-report measures.[2] For the second phase, patients with RA completed the Korean-ENAT at the outpatient clinic of a university hospital and Rasch measurement computer program, WINSTEPS, was used to analyze the data. Fit to the model was determined by the observed data Infit and Outfit statistics (≥0.50 and ≤1.50); where a value of 1.00 suggests a perfect fit to the model expectations. The unidimensionality of the scale was determined by item (and person) separation index ≥2.00 and reliability ≥0.80.

Results: An adequate conceptual equivalence was achieved following the adaptation process. A total of 123 patients completed the Korean-ENAT. Their mean ± SD age was 46.7±12.3, disease duration 53.7±71.2 months and the majority (81.3%) were female. Thirty-five of the 39 items displayed good fit to the model. The 4 items deviating from the model had Infit and Outfit >1.50. The item separation index (5.26) and item reliability index (0.97) provided evidence for good reliability of items. All the 7 domains of the Korean-ENAT were found to fit the Rasch model. The internal consistency of the Korean-ENAT was high and unidimensionality was confirmed (Person separation index =3.41 reliability index =0.92; item separation index =16.82 and reliability index =1.00).

Table 1. Fit statistics for the Korean ENAT subscales

	Infit		Outfit		Point-biserical correlation
Subscales	MNSQ	ZSTD	MNSQ	ZSTD	PTMEA CORR.
Pain	1.31	2.30	1.40	2.80	0.75
Movement	1.00	0.10	1.01	0.10	0.85
Feelings	0.77	-1.90	0.80	-1.60	0.84
Disease	1.27	2.00	1.15	1.00	0.84
Treatments	1.30	2.20	1.21	1.40	0.85
Self-help	1.05	0.50	1.08	0.70	0.84
Support	0.75	-2.10	0.75	-2.10	0.83

MNSQ = mean-square; ZSTD = z-standardized; MNSQ between ≥0.50 and ≤1.50 for model fit.

Conclusions: Using a standard process in cross-cultural adaptation, the ENAT was adapted into Korean and Rasch analysis confirmed that the construct validity, reliability, and unidimensionality of the Korean-ENAT. The Korean-ENAT provides valid and reliable estimates of educational needs of people with RA in Korea.

AB1194 ANTINUCLEAR ANTIBODIES ALGORITHM FOR THE PRIMARY HEALTH CARE PHYSICIANS IN CYPRUS

V. Scoutellas[1], G. Mitis[2], G. Achniotou[3]. *[1]Rheumatology Department; [2]Immunology Department, Nicosia General Hospital; [3]Health Insurance Organization, Nicosia, Cyprus*

Background: due to our daily clinical and laboratory practice, we realized that primary care physicians of Cyprus (public & private sector), as well as other medical specialties, are not familiar with the clinical significance of autoantibodies used to diagnose autoimmune rheumatological diseases. This resulted to an increasing number of orders for autoantibodies, which were irrelevant to the person's condition, leading to a high expenditure for tests not clinically needed, whereas the laboratory was not able to respond to the demand with the available resources (human, hardware, economic).

Objectives: (a) to persuade, through education, all the primary care physicians of Cyprus to order autoantibodies up to the point of the primary healthcare level and (b) to minimize the number of unneeded orders, as well as the expenditure, and save resources. To accomplish this target, we created an algorithm for ordering antinuclear antibodies (ANA). Mainly the primary care physicians should use the algorithm as a protocol.

Methods: we searched the literature to find (a) existing algorithms for ordering the ANA, as well as other autoantibodies that should be performed if ANA is found positive and (b) the relevant scientific evidence to guide primary care physicians while ordering ANA. In addition, we planned educational lectures for all the primary care physicians (public & private sector). Our scope was to develop an algorithm that guides the primary care physician to order antinuclear antibodies only if the person's symptoms are relevant to an autoimmune rheumatological disease.

Results: we found algorithms from different sources (university clinics, scientific societies [medical and laboratory], commercial companies producing autoantibody kits). Most of the algorithms found were focusing on the suspected disease, for which the relevant autoantibodies should be ordered. We established an algorithm targeting the primary care physicians: they should only order antinuclear antibodies if an autoimmune rheumatology disease is suspected; if ANA is negative, then an autoimmune disease does not exist and the test should never be repeated (unless there is an important reason); if ANA is positive, then the person should be sent for a consultation to a rheumatologist, who is responsible to take the medical history, examine clinically the person and decide if there is a need or not to order for any other autoantibodies, if an autoimmune rheumatology condition is still suspected. The developed algorithm was communicated (year 2014) to the primary care physicians through lectures in small teams (it was repeated in seven different teams, and captured almost all). The Cyprus Rheumatology Society acknowledged the algorithm, whereas the Health Insurance Organization, with the Ministry of Health, organized the educational part.

Conclusions: the development and establishment (years 2015–2016) of the algorithm for the ordering of antinuclear antibodies by the primary care physicians, changed their attitude towards ordering nowadays with more scientific and evidenced based criteria. This was seen on the lower numbers of orders of antinuclear antibodies within these two years.

THU0720-HPR PHYSICAL ACTIVITY IN PATIENTS WITH INFLAMMATORY ARTHROPATHIES

A. López Esteban, I. Janta, J.C. Nieto Gonzalez, F. García, C. Garaballu, T. del Rio, C. Barbero, C. Gonzalez, J. Lopez Longo, I. Monteagudo. *Rheumatology, Hospital General Universitario Gregorio Marañón, Madrid, Spain*

Background: Inflammatory arthropathies are a group of diseases that have common characteristics, like unknown etiology, autoimmune or autoinflammatory pathogenesis, genetic predisposition and chronicity. These affect people of all ages and can cause physical, psychic, and social disability. Physical activity is essential to decrease symptoms of pain, fatigue and weakness, improving joint mobility, increasing muscle mass, flexibility and psychosocial health.
Objectives: To describe the physical activity in patients with inflammatory arthropathies.
Methods: In this transversal, observational study we evaluated all patients with inflammatory arthropathies treated with intravenous biologic therapy in a Day Hospital Unit (DHU) of a tertiary hospital. We collected the following data: demographics, indexes of disease activity according to each disease, fatigue questionnaire (FACIT), health questionnaire SF-12, physical activity questionnaire (IPAQ), and fibromyalgia questionnaire (FIRST). This represents a cohort of patients that initiate an educational program on the importance of physical activity in the management of the disease.
Results: We included 222 patients (60.8% female), with a median age (SD; range) of 56.19 (12.89; 25–82) and a median disease duration (SD) of 16.54 (9.6). Of all included patients, 54.1% had rheumatoid arthritis, 39.2% had spondyloarthropathy and 6.8% has psoriatic arthritis; 26.8% were in remission, 39.2% presented moderate activity disease and 13.5% had high disease activity. Forty five (20.3%) patients had fibromyalgia according to FIRST questionnaire. According to the IPAQ questionnaire, 19.8% performed high physical activity, 24.8% moderate physical activity and 55.4% low physical activity. The FACIT score was significantly greater in patients with low physical activity ($p<0.05$). 73% of patients considered that their diseases affect the performance of physical activity. 67% of the patients had none or very low daily physical activity, 80% would like to do more exercise. Among sports or physical activities performed by the patients, the most common was walking (65%), then swimming (12%), cycling and gym (8%) and running (6%). Of the patients who perform physical activity, 43% practice more than one sport.
In a multivariate regression logistic, only the gender and the age related with the physical activity, and not the disease; males (p=0.024; Exp(B) 2,389; IC 95% 1,124- 5,059) and younger persons (p=0,004; Exp (B) 0,959; IC 95%: 0,943–0,987) performed more physical activity.
Conclusions: Patients with inflammatory joint diseases perform low physical activity. The nurse plays a very important role in educating and informing the patients about their illness, and helping them in changing their lifestyle, encouraging increased physical activity with appropriate programs depending on the alterations that produce each disease, in order to improve their quality of life.

THU0721-HPR MULTIDISCIPLINARY EDUCATIONAL PROGRAM FOR PATIENTS WITH HIP- OR KNEE-OA: RESULTS OF A PILOT STUDY

A. Claassen[1], H. Schers[2], S. Koëter[3], J. Botman[4], W. Rijnen[5], W. Noort-van der Laan[1], C. van den Ende[1] on behalf of projectteam "Towards a regional approach of osteoarthritis". *[1]Rheumatology, Sint Maartenskliniek; [2]Primary and Community Care, Radboud University Medical Center; [3]Orthopaedic Surgery, Canisius Wilhelmina Hospital; [4]Stichting Gezondheidscentrum de Kroonsteen - de Vuursteen; [5]Orthopaedic Surgery, Radboud University Medical Center, Nijmegen, Netherlands*

Background: Providing relevant disease-related and self-management related information helps patients to timely seek contact with care providers and become actively involved in their own care process. A problem recognized in the area of Nijmegen, the Netherlands is the conflicting information about OA which is disseminated by different health professionals and health organizations. Therefore, health professionals from primary care, multiple hospitals and health organisations decided to work together and develop an educational program based on a structured inventory of informational needs and on consensus-based information addressing those needs.
Objectives: To determine preliminary effects of a multidisciplinary patient educational program on health care utilization (primary outcome) and on body mass index (BMI), self-efficacy, knowledge on OA and treatment, illness perceptions, pain and functioning and physical activity.
Methods: A total of 146 participants attended 11 organized courses. The educational program consisted of 2 meetings, provided by a physiotherapist, a general practitioner (GP) and an orthopaedic surgeon or specialized nurse. The program comprised education on OA, treatment options and self-management, tips, practical assignments and aphorisms on OA which are repeated by the different course leaders. At baseline and at 3 months follow-up, the following outcome measures were assessed: contacts with different health care providers in the past 3 months, BMI (kg/m^2), self-efficacy (10–40), knowledge on OA and treatment (0–22), illness perceptions (0–100), pain and functioning (0–100) and physical activity (min/week). Paired-sample t-tests and McNemar's test were used to estimate the preliminary effects of the program on primary and secondary outcomes.
Results: A total of 144 participants agreed to participate in this study, 108 (75%) participants filled out both questionnaires. The mean (SD) age of the participants was 69.1 (10.2) years with 62.5% being female. Fifty-six percent of the participants had experienced their OA symptoms for less than 5 years. We found a significant decrease in proportion of patients who had visited their GP in the past 3 months (40.7% to 25.0%, p-value 0.02). Also, we observed a statistically significant decrease in proportion of patients who visited the physiotherapist in the past 3 months, (36.1% to 25.0%). Illness perceptions changed positively (95% CI: 0.4 – 3.4), and knowledge on OA and treatment options improved (95% CI: -3.0 - -1.6). No changes in pain, functioning and self-efficacy were found. However, a trend towards a decrease in BMI and an increase in physical activity was seen.
Conclusions: Results of this study show that collaborating with multiple health professionals to provide patients with clear information on OA, treatment and self-management options in a multidisciplinary educational program, can result in differences in health care utilization and have positive effects on illness perceptions and knowledge on OA. A randomized controlled trial is needed to confirm these results.

THU0722-HPR THE EFFECTS OF KINESİO TAPING ON PAIN, JOINT RANGE OF MOTION, MUSCLE STRENGTH AND DISABILITY IN IMPINGEMENT SYNDROME

A. Yildiz[1], Y. Buyuktepe[2]. *[1]Physiotherapy and Rehabilitation, Marmara University Health Sciences Faculty; [2]Istanbul Education and Research Hospital, Istanbul, Turkey*

Background: The impingement syndrome is common cause of shoulder pain. Physical therapy includes manual therapy techniques, electrotherapy modalities and exercises in this problem. The Kinesio Taping application is a definitive rehabilitative taping technique that is designed to facilitate body's natural healing process while providing support and stability to muscles and joints without restricting the body's range of motion
Objectives: The purpose of this study was to determine the efficacy of kinesio taping (KT) on subjects' pain, joint range of motion, muscle strength and level of disability in treatment of impingement syndrome (IS).
Methods: The study was conducted patients with IS. The subjects were divided into two groups randomly as general physical therapy applications group (GPTG) and kinesio taping group (KTG). GPTG was treated transcutaneous electrical nerve stimulation (TENS), hotpack and ultrasound for ten session. KTG's therapy was contained shoulder kinesio taping application in addition to TENS, hotpack and ultrasound. KT was applied as "Y strip" to deltoid and supraspinatus muscles and was "I strip" to muscle of teres minor. The groups were evaluated before and after treatment in terms of pain, range of motion (ROM), muscle strength and scores of shoulder disability. Visual analog scale was used to assess of pain (night pain, rest pain, pain with motion and general pain), goniometer measurements was used to assess of shoulder ROM, Shoulder Disability Questionnaire and Disabilities of the Arm Shoulder and Hand were used to assess of shoulder disability.
Results: 54 patients with IS aged 18 to 65 years were recruited to the study. Demographic data were similar in the groups. When compared before and after treatment, the level of pain (night pain, rest pain, pain with motion and pain in functional use) was significantly decreased in both groups ($p<0,05$) (Table 1), also an improvement was seen in muscle strength ($p<0,05$), ROM ($p<0,05$) and in the scores of disability of shoulder ($p<0,05$) in both groups. In terms of overall pain relief the KTG scores better than GPTG. Internal and external rotation muscle

forces increase in the KTG; flexion, extension, internal and external rotation muscle forces increased in the GPTG ($p<0,05$ for all). But there was no significant difference between the two groups.

Table 1. The level of pain in GPTG and KTG

	GPTG (mean ± sd)			KTG (mean ± sd)		
	Before Therapy	After Therapy	p	Before Therapy	After Therapy	p
Night pain severity	6,69±3,4	3,62±2,9	<0,001	5,28±3,18	2,32±2,23	<0,001
Rest pain severity	3,97±3,31	2,45±2,78	0,005	2,96±3,29	1,08±1,75	0,031
Pain severity with motion	8,07±1,81	5,14±2,47	<0,001	7,72±2,03	4,36±2,21	<0,001
Severity of general pain	7,76±4,54	4,66±3,99	<0,001	8,40±3,13	4,8±2,69	0,005

Active internal and external rotation ROM increased in KTG ($p<0,05$). Functionality and disability scores were improved in two groups. It was detected that while there was no difference between the groups in terms of the values of muscle strength, functionality and disability scores.

Conclusions: The kinesiologic band can be used as an supportive therapy method in the early shoulder treatment program because of it provides painless shoulder motion to clinicians. We consider that KT applications in addition to general physical therapy applications may have positive effects in the treatment of impingement syndrome.

THU0723-HPR A PHYSIOTHERAPY-LED IN-PATIENT INTENSIVE REHABILITATION PROGRAMME FOR ANKYLOSING SPONDYLITIS: FOLLOW-UP OUTCOMES

C. Clarke[1], P. Taggart[1], J. Monaghan[1], J. McKnight[2], A. Cairns[2]. *[1]Physiotherapy; [2]Rheumatology, Musgrave Park Hospital, Belfast, United Kingdom*

Background: Physiotherapy and exercise are highly important in the management of Ankylosing Spondylitis (AS). Physiotherapy is delivered to patients with AS in either in-patient or out-patient settings. Knowledge of the effectiveness of an in-patient delivered programme is useful for physiotherapists in assisting patients to achieve their goals.

Objectives: To assess the short-term effectiveness of an intensive rehabilitation programme using BASMI and EASI-QOL outcomes, and long-term patient satisfaction and physical activity behaviour and adherence to exercise plan.

Methods: Thirty-two AS patients (25 males and 7 females) admitted to an in-patient rheumatology ward underwent a 1 to 2-week physiotherapy-led intensive rehabilitation programme and were then discharged with a home exercise programme. Pre/post rehabilitation BASMI scores were available for 26 patients. The primary outcome measure was the proportion of patients achieving an improvement on BASMI scores at discharge. Secondary outcome measures included improvements in physical activity levels and adherence to home exercise plan for longer than 3 months which was obtained via a postal patient satisfaction and physical activity questionnaire achieving a response rate of 50% (n=16).

Results: Improvements in BASMI scores was achieved in 69% of patients (n=18) at the end of the in-patient rehabilitation period. Improvements in EASI-QOL were achieved in 83% of patients (n=15) at the end of the in-patient rehabilitation period. Ninety- four percent of patients (n=15) increased their physical activity levels after discharge, with 81% (n=13) of patients maintaining their home exercise programme for 3 months or more. Thirty-seven percent (n=7) of patients carry out at least 150 minutes of physical activity per week (National Recommended Physical Activity Guidelines is 150 minutes/week of moderate intensity).

Conclusions: This recent audit shows the effectiveness of an intensive physiotherapy-led in-patient rehabilitation programme for Ankylosing Spondylitis improving BASMI scores in the short-term and increasing physical activity behaviour over the long-term. Future work will aim to compare demographics and medical treatment differences between improvers and non-improvers.

THU0724-HPR SELF-MANAGEMENT EXERCISE PROGRAM ASSOCIATED TO SPA THERAPY INCREASED THE PHYSICAL ACTIVITY LEVEL OF PEOPLE WITH SYMPTOMATIC KNEE OSTEOARTHRITIS: A QUASI-RANDOMIZED CONTROLLED TRIAL

C. Gay[1], C. Auclair[2], N. Boisseau[3], L. Gerbaud[4], E. Coudeyre[1]. *[1]Physical and Rehabilitation Medicine Department, Clermont-Ferrand University Hospital, Clermont Auvergne University, INRA, Human Nutrition Unit UMR1019, Clermont Ferrand; [2]Public Health Department, Clermont-Ferrand University Hospital, Clermont Auvergne University, PEPRADE, EA 4681; [3]Laboratory of the Metabolic Adaptations to Exercise under Physiological and Pathological condition (AME2P), Clermont Auvergne University, EA 3533, Clermont-Ferrand; [4]Public Health Department, Clermont-Ferrand University Hospital, Clermont Auvergne University, PEPRADE, EA 4681, Clermont Ferrand, France*

Background: Treating knee osteoarthritis (OA) in the medical phase is today well standardized. Guideline orientated approaches aiming at increasing physical activity (PA), improving pain and disability.

Objectives: To assess effectiveness of self-management exercise program associated to spa therapy at 3 month on the improvement of physical activity (PA) level, disability, pain, anxiety, fears and believes in symptomatic knee osteoarthritis people.

Methods: Prospective, multicentric, quasi-randomized controlled trial with alternate month design method (one month periods). People with symptomatic knee OA people (stage I-IV, Kelgren and Lawrence scale) with low and moderate PA level were included in 3 spa therapy resorts. Intervention group (IG) received 5 self-management exercise sessions (1h30; education, aerobic, strength training, range of motion) + information booklet + 18 sessions (1h) of conventional spa therapy (STC). Control group (CG) received information booklet + 18 sessions of STC. The primary outcome was changes at 3 months in PA level (IPAQ short form score) and secondary outcomes were WOMAC function, pain (VAS), HAD anxiety/depression, KOFBeQ fears and believes changes.

Results: 131 subjects were included. The mean age was 65.6 years [± 6.7]. WOMAC function score was 22.1/68 [±11.3] and pain was 4.6/10 [± 1.9] at inclusion. Both groups significantly increased PA level measured with continuous IPAQ total score (MET-minutes/weeks), with superiority for IG (+77.8%; p=0.0062) than CG (+50.7%; p=0.0099). There was no change in setting time. Disability (-11.3%; p=0.0370) and pain (-15.2%; p=0.0032) also decreased significantly for both groups. Anxiety (-11.6%; p=0.0195) and fears and believes (-18.2%; p=0.0146) decreased significantly only in intervention group. Other data will be presented later.

Conclusions: This study confirms the impact of STC on disability and pain and gives news data's on physical activity level. Self-management exercise program improve anxiety, fears and believes. Complex educational strategies comprising information booklet with or without self-management exercise program can be proposed and adapted to OA phenotypes.

THU0725-HPR COST EFFECTIVENESS ANALYSIS OF ABATACEPT COMPARED WITH TNF INHIBITORS IN PATIENTS WHO ARE POSITIVE FOR ANTI-CITRULLINATED PROTEIN ANTIBODIES BASED ON RESULTS FROM AN OBSERVATIONAL TRIAL

S. Johal[1], E. Alemao[2]. *[1]PAREXEL International, London, United Kingdom; [2]Bristol-Myers Squibb, Princeton, United States*

Background: Anti-citrullinated protein antibodies (ACPA) are highly specific to RA and patients (pts) who are ACPA positive (+) tend to develop more severe, erosive disease than ACPA-negative pts.[1] In an observational study exploring the status of ACPA on RA treatment response to abatacept (ABA) or a TNF inhibitor (TNFi), mean (SE) changes from baseline in CDAI at 6 months was –8.8 for ABA and –5.6 for TNFi initiators.[2]

Objectives: To evaluate the costs and benefits of treating pts with RA who are ACPA+ with ABA vs TNFi on background MTX.

Methods: An economic analysis was carried out estimating lifetime direct costs and quality-adjusted life years (QALYs) of ACPA+ pts with RA treated with ABA or TNFi from a UK National Health Service (NHS) perspective. QALYs are a measure of disease burden, adjusted to reflect quality of life lived. As data for the economic analysis were derived from a real-world study, an "average" pt was modelled, whose baseline characteristics were based on the observational study. CDAI changes at 6 months for each treatment were converted to HAQ changes, and disease progression was based on HAQ score changes over a lifetime. Continuation of therapy was based on rates from the real-world study. Mean long-term survival on treatment with ABA or TNFi was derived from the literature.[3] In the base case, pts discontinuing ABA or TNFi moved to palliative care (MTX). Direct medical costs and quality of life scores were correlated to HAQ scores.[3,4] Costs included hospitalizations, joint replacements and treatment costs. Estimates of differences in costs and QALYs between ABA and TNFi initiators were used to calculate an incremental cost-effectiveness ratio (ICER; cost per QALY gained). The annual cost of TNFi was calculated as an average of TNFi drugs in the UK (£ 9113). For ABA, an average cost of five biologics was used (£ 9244) to reflect a realistic cost to NHS UK. A sensitivity analysis examined the effect of varying the input parameters of efficacy, cost and utilities on costs and outcomes.

Results: Based on an "average" pt from the observational study, the total estimated QALYs for ABA and TNFi initiators were 6.4 and 6.27, respectively. Total lifetime costs were £ 41,378 and £ 40,627, respectively. The lifetime cost for

ABA initiators was higher than for TNFi initiators due to the higher proportion of pts continuing ABA after 6 months. ABA treatment resulted in lower hospitalization costs. The cost per QALY for ABA (vs TNFi) was £ 8667. An intervention with an ICER of less than £ 30,000 per QALY gained is generally considered to be cost effective in the UK. In a sensitivity analysis, in which the annual cost of TNFi was assumed to be the same as a biosimilar agent (£ 7829), the ICER increased to £ 25,660.

Conclusions: Based on real-world data, abatacept is a cost-effective alternative to TNFi in an ACPA+ pt with RA. The increased treatment costs of abatacept are offset by the gain in benefits (QALYs) from higher CDAI reductions with abatacept.

THU0726-HPR WHAT CHARACTERISES PATIENTS REFERRED FOR SURGICAL CONSULTATION DUE TO CARPOMETACARPAL OSTEOARTHRITIS?

E.M.H. Gravas[1], R. Nossum[2], R.E.M. Eide[3], A. Klokkereide[4], K.H. Matre[3], M. Olsen[4], S. Darre[2], O. Andreassen[1], N. Osteras[1], I. Kjeken[1].
[1]Diakonhjemmet Hospital, Oslo; [2]St.Olavs Hospital, Trondheim; [3]Haukeland University Hospital, Bergen; [4]Haugesund Rheumatism Hospital, Haugesund, Norway

Background: Carpometacarpal osteoarthritis (CMC-OA) is a common joint condition, with a prevalence of 13% in people aged 41 to 50 years, increasing to 68% in people between 71 and 80 years. In the absence of disease-modifying interventions, non-pharmacological approaches are considered as core treatments for hand OA, while surgery is recommended for those with severe CMC-OA.

Objectives: To describe function and previous treatment in patients referred for surgical consultation due to CMC-OA.

Methods: Individuals referred for surgical consultation due to their CMC-OA at three Norwegian departments of rheumatology were invited to participate. Those who agreed attended a clinical assessment and reported their symptoms, disability and function using validated outcome measures including the Quick-Dash (0–100, 0=no disability) and the MAPHand (1–4, 1=no limitations).

Results: A total of 180 patients (mean age 63, range: 45 to 82; 79% women) were included. Thirty-six percent were referred for right hand, 43% for left hand, and 21% for bilateral surgery. Concerning previous treatment for hand OA, 21% (78% women) had received hand surgery, 22% (81% women) physical or occupational therapy, and 11% (95% women) had consulted a rheumatologist. Women consistently reported higher pain levels compared to men, had more finger joints with bony enlargements and significantly lower grip and pinch strength in both hands (Table). They also reported significantly more disability and activity limitations at Quick Dash; 38.6 versus 30.4, (p=0.006) and MAPHand; 2.0 versus 1.7 ($p<0.001$), for women and men, respectively. However, for finger range of motion, men had slightly more flexion deficit and less palmar abduction in their left hand compared to women.

Conclusions: Among patients referred for surgical consultation due to CMC-OA, women self-reported lower hand function and scored poorer than men in observer based assessments. Even if conservative treatment is recommended before referral for surgery, only a few participants had received such treatment for their hand OA.

THU0727-HPR BLENDED INTERVENTIONS FOR FATIGUE SELF-MANAGEMENT: IS THIS THE WAY PATIENTS AND PROFESSIONALS LIKE TO GO?

C. Bode[1], E. Taal[1], H. Vonkeman[2], F. Ben Allouch[1], K. Hohl[1]. *[1]Psychology, Health & Technology, University Twente; [2]Rheumatology, Medisch Spectrum Twente, Enschede, Netherlands*

Background: Blended care, the integration of online and face-to-face care, promises to combine the best of two worlds.

Objectives: To explore the attitudes and needs concerning blended care of two key stakeholders: health professionals and patients.

Methods: Rheumatologists (8) and specialized nurses (5) were recruited in a Dutch hospital and patients with an inflammatory rheumatic disease (10) were recruited via flyers in hospitals and patient organizations in Germany. A semi-structured interview scheme was used to explore knowledge, experiences, needs and perceived (dis)advantages of a blended care format for fatigue self-management. Transcribed verbal data were coded with hierarchical coding schemes.

Results: Perspective of professionals: Blended care matches needs for psychosocial interventions in medical settings, has a patient-friendly and flexible format, reflects the active role of patients and can easily be imbedded in standard care. Reported barriers were low education and skills in technology use in patients, the lack of proven and safe interventions and costs for development/ implementation. Patient perspective: Patients expected better communication, time saving and improvement of autonomy in self-management. They were concerned about loss of personal contact and in general, patients were very critical regarding online activities, privacy risks and guaranteed quality of eHealth products.

Conclusions: Health professionals and patients differ in their attitudes towards blended care. Professionals are better informed and have a more positive attitude, whereas patients' attitudes towards blended care are mainly driven by their reservations towards the reliability and safety of the internet in general. Results will be discussed on the background of attitudes towards eHealth in different countries.

THU0728-HPR COMPARISON OF THE EFFECTIVENESS OF FUNCTIONAL AND NIGHT SPLINT FOR RHIZARTHROSIS: ONE-YEAR FOLLOW-UP OF A CONTROLLED, RANDOMIZED, BLINDED CLINICAL TRIAL

F.C. Silva, S.M.M. Adolph, R.V.T. da Silva, J. Natour. *Department of rheumatology, Federal university of São Paulo, São Paulo, Brazil*

Background: Rhizarthrosis is an inflammatory degenerative joint disease affecting the trapeziometacarpal joint. The main symptom is pain, leading to difficulty with hand functions and reduced quality of life. Two randomized controlled trials found in the literature reported similar findings in terms of pain reduction and improved hand function with the use of a short orthosis for rhizarthrosis; one of the trials showed the benefits when the device was used for daytime function while the other showed the benefits when the orthosis was used during nighttime rest.

Objectives: To compare the effectiveness of functional (daytime) and night splint (Figure 1) in reducing pain and improving functionality in patients with rhizarthrosis.

Methods: A controlled, randomized, blinded clinical trial with sixty patients diagnosed with rhizarthrosis. The patients were assessed by a blinded assessor at the beginning of the treatment and after 45, 90, 180 and 360 days the following variables were evaluated: pain at the base of the thumb using a a numerical pain scale; thumb range of motion measured using a goniometer; grip strength evaluated by a hydraulic hand dynamometer; pinch strength using the pinch gage; hand dexterity evaluated with the pick-up test; function evaluated by the Brazilian version of the AUSCAN LK 3.01 Hand Osteoarthritis Index, the Cochin Hand Function Scale, the Michigan Hand Outcomes Questionnaire and a Likert-type scale. The Hand Outcomes Questionnaire, Cochin Scale and Michigan Questionnaire were used to assess hand function and patient satisfaction using a Likert scale.

Results: Most of the variables analyzed, including patient characteristics such

as age, gender, disease duration and hand dominance, were homogeneous at the beginning of the study. In both groups there was a reduction in hand pain with time (intragroup analysis). Pain in the functional group, expressed as mean ± standard deviation, was 6.82±1.72 and 4.77±2.45 at the beginning and end of the treatment, respectively, and the corresponding figures for the nighttime group were 7.20±1.63 and 4.83±2.68. The p values for both groups were $p<0.001$. There were no statistically significant differences in the majority of the parameters assessed between the groups, including the outcome pain. Three measures considered to be occasional, presented a significant difference between the groups: right palmar abduction p=0.023 and right tripod pinch strength p=0.006 with better results for the group that used the night splint; and time execution of the pick-up test with eyes closed to the right hand p=0.048 with more representative results for the functional (daytime) splint use.

Figure 1: Splint for rhizarthrosis

Conclusions: There was no statistically significant difference between functional and night splint in terms of pain, function or any of the other parameters assessed in rhizarthrosis patients after one year of treatment.

THU0729-HPR PATIENTS AND CAREGIVERS PREFERENCES RELATED WITH THE USE OF INFORMATIC TECHNOLOGY TOOLS FOR EDUCATION IN RHEUMATOID ARTHRITIS

S. Henao[1], F. Rodriguez[2], L. Villarreal[3], P. Santos-Moreno[4], M. Cabrera[5], D. Buitrago-Garcia[6], C. Caicedo[7]. *[1]Patient service; [2]Patient Program; [3]Psychology and processes; [4]Rheumatology; [5]Engineer and processes; [6]Epidemiology, Biomab, Center for Rheumatoid Arthritis, Bogota; [7]Public Health, Universidad Nacional de Colombia, Bogota, Colombia*

Background: Rheumatoid arthritis (RA) is a chronic inflammatory disease of the joints affecting more than 1% of global population, it is a long term condition that causes pain, disability and affects the quality of life (1). It has been demonstrated that patient's involvement with its treatment and disease management can be more effective than information-only given by the physician or a health care professional (2).

Objectives: To describe patient's preferences regarding information technology tools for education and RA management in a specialized center in Bogotá Colombia.

Methods: We conducted a descriptive study where a survey was applied to a group of patients or care-givers attending to a patient-focused symposium in Bogotá Colombia. Descriptive epidemiology was done; percentages and averages were calculated for qualitative variables.

Results: We included 452 participants, 80% were patients and 20% caregivers, only 25% referred to assist to informative activities regarding disease management, 41% reported to have information regarding RA, also between 29% and 45% of patients acknowledged the role of the health-care team in the disease activity management. Regarding technology information tools patients considered that WhatsApp was the most important tool to received messages to disease management (40%) followed by YouTube and websites. 70% reported to have a computer or a mobile phone with internet connection, 60% reported to use Facebook while only 30% reported to use easily websites and twitter.

Conclusions: It is important to know the preferences and access that patients and caregivers have to informatics technology in order to create self-care programs that really are going to be used in this population. This survey is evidence not only to start an educational program in our specialized center but to the health care professionals and stakeholders in Colombia.

THU0730-HPR CONTENT AND SUPERVISION OF GROUP EXERCISE THERAPY (GET) FOR AXIAL SPONDYLOARTHRITIS (AXSPA) IN THE NETHERLANDS; A NATION WIDE SURVEY

F. Van Der Giesen[1,2], S. Van Weely[2], N. Lopuhaa[3], T. Vliet Vlieland[2]. *[1]Rheumatology, Haga Teaching Hospital, The Hague; [2]Orthopedics, Leiden University Medical Center, Leiden; [3]Dutch Arthritis Foundation, Amsterdam, Netherlands*

Background: For axSpA patients exercise therapy is recommended in (inter)national treatment guidelines. Apart from mobility exercises, muscle strengthening and cardio vascular training are recommended therapeutic modalities [1,2]. In the Netherlands 45 therapy groups (land based exercises; 1, hydrotherapy; 13, combination groups; 31) are organized by 17 local patient organizations exclusively for AxSpA patients. It is unclear if the treatment recommendations are followed and what the nature of the supervision in these exercise programs is.

Objectives: To describe the therapeutic modalities used and characteristics of the supervision in GET for patients with axSpA in the Netherlands.

Methods: A questionnaire was sent to the coordinating supervisors of GET from the17 local patient organisations involved in GET for axSpA with questions regarding the frequency and duration of group exercise programs and treatment modalities (mobility, stregthening and/or cardio-vascular exercises) used in land-based and hydrotherapy parts of the programs. In addition the questionnaire included questions regarding the number of supervisors involved in the supervision of GET, their professional background (physical therapist, other), years of experience with GET (<1yr, 1–5 yrs, >5yrs) additional education related to rheumatic diseases (yes/no) and rheumatology network membership (yes/no).

Results: All 17 coordinating supervisors of GET for axSpA returned the questionnaire. All exercise groups were performed once a week with a median (range) duration of 30 minutes (30–60) for the hydrotherapy and 105 minutes (45–180) for the combination therapy groups. Regarding land-based treatment modalities, active joint range of motion exercises and muscle strengthening exercises were used as stated by 15/17 and 14/16 coordinators respectively. In hydrotherapy this was 17/17 both. 13/16 coordinators stated that cardio-vascular training was used in land-based parts and in hydrotherapy parts in 14/17. Only 1/17 coordinator stated that hart rate monitoring (land-based) was used. A total of 64 supervisors were involved in GET for axSpA of whom 54/60 were physical therapists. 35/59 were involved for more than 5 years, 21/55 had post graduate rheumatology education and 10/54 were rheumatology network members.

Conclusions: Mobility and strengthening exercises are used in the majority of GET programs, but hart rate monitoring is almost never used raising questions regarding the intensity of these programs. The duration of exercise sessions showed a wide variety, as did the program composition (water based/land and water based) identifying considerable practice variation. The majority of the supervisors were physical therapists with long standing experience but only a minority had postgraduate rheumatology education. To ensure the quality of GET for patients with axSpA, reducing practice variation is a future challenge. Education of GET supervisors might be important aspects and target of priority.

THU0731-HPR CAN A THREE WEEKS PROGRAM IN A REHABILITATION CENTER IMPROVE SYMPTOMS AND EXERCISE-FREQUENCY FOR RHEUMATIC PATIENTS?

G. Jarret, A. Orpana. *Skogli Helse- og Rehabiliteringsenter AS, Lillehammer, Norway*

Background: Rehabilitation for people with rheumatic disorders (15% of worldwide population) is a long term project (Stoffer et al. 2015). Rheumatic patients do not exercise as often as recommended (Holm et al. 2015). Intensive multidisciplinary interventions in rehabilitation-centers are in some countries an option – of which there is little effect knowledge. Perhaps data from a quality-management report can shed some preliminary light on this subject.

Objectives: Primarily to observe short and long term effects of a three weeks intensive multidisciplinary program for people with rheumatic disorders, and secondary to see if a correlation can be found between level of training frequency and levels of pain, stiffness, and self rated health.

Methods: 738 patients (age 62.0+11.1, 84% women), followed a three weeks multidisciplinary program of individual and group sessions - with physiotherapy as main focus - during the period of August 2010 to September 2016 at Skogli Health- and Rehabilitation Center, Lillehammer, Norway.
3-month follow-up: N=252 and 12-month follow-up: N=118. Data from self-reported questionnaires at T1-T4 was gathered. Paired sampled T-tests and Pearson product-moment correlation coefficients was used to analyze the data obtained, using IBM SPSS Statistics v.23.
Instruments:

- NRS-11 for pain and stiffness at baseline (T1), at discharge (T2), and at 3- (T3) and 12 months (T4) after discharge.
- Likert scale (1–6) for self-rated level of health at T1, T2, T3 and T4.
- Self-reported level of training frequency at T1, T3 and T4

Results: There was a clear mean improvement ($p<0.0001$) on all factors at T2 of moderate/large effect-size. At T3 there was a mean improvement ($p<0.05$) on all factors, except pain, of small/moderate effect size. There was a mean improvement ($p<0.05$) on self-rated level of health and training frequency at T4 of a small effect size. Worth noting is that the degree of stiffness and pain at T4 is back to T1-level.
There was a correlation ($p<0.05$) between level of training frequency and self-rated level of health (small at T1/T3, medium at T4), but no correlation between level of training frequency and level of pain or stiffness, at any time. This suggests that a higher training frequency is associated with a higher sense of health – regardless of symptom levels.
Conclusions: People with rheumatic disorders seem to have a very positive short term effect on all aspects after a three week intensive multidisciplinary program, but gradually return to pre-rehab levels during the following year – especially regarding symptoms like stiffness and pain. At the same time there seems to be a much slower decline in self-rated level of health – especially for those who regularly exercise. Properly randomized controlled trials are however needed to be able to draw any clear conclusions.
Implications: There might be a need for intensive multidisciplinary programs for rheumatic patients at intervals of less than a year, to be able to better keep the general health and function gained. Another possible implication is to implement a stronger focus on teaching rheumatic patients the necessity for an active lifestyle – including regular exercises – for them to be able to maintain their sense of general health, regardless of symptom levels.

THU0732-HPR ENHANCED MANAGEMENT OF ANKYLOSING SPONDYLITIES THROUGH GUANGDONG INTERNET HOSPITAL IN CHINA:A RANDOMIZED, CONTROLLED TRIAL

H. Zhengping[1], L. Tianwang[1], H. Zhixiang[1], P. Xia[1], Z. Lihua[2], H. Yukai[1], Y. Xiaoyan[1], L. Meng[1], H. Xuechan[1], W. Yunqing[1], L. Xumian[1], T. Yao[1].
[1]Department of Rheumatology and Clinical Immunology; [2]Nursing Department, Guangdong NO.2 Provincial People's Hospital, Guangzhou, China

Background: Ankylosing Spondylitis (AS) is a kind of common chronic disease.Guangdong Internet Hospital is China's first officially recognized network hospital and the government encourage development of telemedicine in the country. Increasing research evidences support the efficacy of telemedicine in management of chronic diseases. However, There are still few researches about AS management by using telemedicine.
Objectives: We here conducted a 6-month randomized, controlled trial to evaluate the feasibility and efficacy of Guangdong Internet Hospital in AS management.
Methods: A total of 102 AS patients were randomly divided into two groups: standard care (ST) group or standard care with Network-Enhanced Management (ST-NEM) group. NEM enhanced disease management including cognition of the disease, medication monitoring, behavioral management and psychotherapy. Individuals were assessed by using several tools at baseline and 6 months later: Bath Ankylosing Spondylitis Disease Activity Index (BASDAI) for the disease acticity, Ankylosing Spondylitis Functional Index (BASFI) for the functional limitation, the Zung Self-Rating Anxiety Scale (SAS) and the Zung Self-Rating Depression Scale Zung (SDS) for the psychological status, Pittsburgh sleep quality index (PSQI) for the sleep quality, and SF-36 for the general health status. In addition, we made a satisfaction survey about the network platform in the management of the disease. Both group received the same medications during the period. There were no significant differences in baseline demographic and clinical characteristics between the two groups.
Results: After 6 month, 91 patients completed the trial. BASFI (1.75±0.73 vs. 2.04±0.69, P=0.026), SAS (28.12±3.22 vs. 39.56±4.61, P=0.022), SDS (26.51±6.34 vs. 32.12±6.34, P=0.031), PSQI (3.31±0.46 vs. 4.79±0.54, P=0.019) and SF-36 (SF-36M: 54.24±9.66 vs. 61.41±8.56, P=0.014; SF-36P: 63.42±11.08 vs. 68.98±10.46, P=0.032) were significantly lower in ST-NEM group than ST group after 6 months. There was no significant difference in BASDAI (2.66±0.91 vs. 2.75±0.75, P=0.068) between the two groups. Individuals assigned to the ST-NEM group reported significantly improvement in functional limitation, psychological status, sleep quality and the general health status. In addition, Guangdong Internet Hospital were widely accepted by the AS patients in disease management.
Conclusions: Guangdong Internet Hospital showed potential feasibility and efficacy in AS management. AS patients may receive disease management through the netwrok platform conveniently and effectively, especially those in the remote areas of the country. The results may be important for clinical practice in disease management of AS by using telemedicine.

THU0733-HPR REHABILITATION IN WARM CLIMATE FOR YOUNG ADULTS WITH INFLAMMATORY RHEUMATIC DISEASE. A 12 MONTHS RANDOMIZED CONTROLLED TRIAL

I.R. Nilssen[1,2], H. Koksvik[2], K. Grønning[1], A. Steinsbekk[1]. *[1]Department of Public Health and Nursing, Norwegian University of Science and Technology; [2]Norwegian National Advisory Unit on Pregnancy and Rheumatic Diseases, Department of Rheumatology, ST.OLAVS Hospital, Trondheim, Norway*

Background: Rehabilitation in warm climate has long been an established non-pharmacological treatment for patients with inflammatory rheumatic disease (IRD) in Norway. It has however not been tailored to the needs of young adults, who often have different challenges than older adults with IRD.
Objectives: The aim of this study was to investigate if a rehabilitation program in warm climate tailored to young adults from 20 to 35 years had effect on physical function and self-management/coping, 12 months after completed intervention.
Methods: This was an open randomized controlled pilot trial, with a 2-group parallel design and a 1:1 allocation ratio. Patients were recruited from three different rheumatology outpatient clinics in central Norway. The intervention group received a 17 day long rehabilitation stay in Spain. The main component of the tailored intervention was intensive exercise (2–3 times per/day), individual physiotherapy (daily) and patient education. The control group received treatment as usual. The primary outcome measure was physical function assessed by the "30 second Sit to Stand test" (30sSTS, number of sit and stand during 30 seconds, higher score is better) and self-management/coping measured by the "Effective Musculoskeletal Consumer Scale" (EC17, higher score is better).
Results: Forty patients (mean age 27.5, 65% female) with IRD (intervention/control: 3/2 rheumatoid arthritis, 3/9 juvenile idiopathic arthritis, 4/5 psoriatic arthritis, 8/3 ankylosing spondylitis and 2/1 polyarthritis) were randomized. 19 out of 20 patients completed the intervention. At twelve months follow up there were 3 patients lost to follow up from the intervention group, and 2 in the control group. Patients in the intervention group had a significant improvement in the 30sSTS test 3, 6 and 12 months after completed intervention, compared to the control group (Table 1). The within group analysis showed that both groups improved at 6 and 12 months. The EC17 showed no difference between the two groups at 3, 6 or 12 months.
Conclusions: The results indicate that the intervention group significantly improved their physical function one year after the intervention compared to the control group, but there was no effect on self-management/coping. These results

Abstract THU0733-HPR – Table 1

Outcome measures	Baseline values	Change from baseline to					
		3 months		6 months		12 months	
	Mean (SD)	Mean (95% CI)	p-value	Mean (95% CI)	p-value	Mean (95% CI)	p-value
30sSTS							
Within group							
Intervention	12.75 (3.2)	8.7 (5.7–11.8)	**<0.001**	8.5 (5.1–11.9)	**<0.001**	10.6 (7.3–14.0)	**<0.001**
Control	13.15 (2.7)	1.1 (-0.5–2.7)	0.169	3.7 (1.2–6.2)	**0.006**	3.8 (0.6–7.1)	**0.024**
Between groups		7.6 (4.3–10.9)	**<0.001**	4.7 (0.7–8.8)	**0.024**	6.8 (2.3–11.3)	**0.004**
EC17							
Within group							
Intervention	64.5 (19.1)	0.9 (-4.0 -5.7)	0.709	2.2 (-3.4–7.8)	0.427	4.0 (-3.7–11.7)	0.291
Control	64.4 (10.3)	2.2 (-2.1–6.5)	0.295	6.8 (1.9–11.7)	**0.009**	4.2 (-1.2–9.5)	0.119
Between groups		-1.3 (-7.6–4.9)	0.670	-4.6 (-11.8–2.6)	0.2	-0.2 (-9.0–8.7)	0.966

might reflect that the focus of the intervention was mainly intensive exercise, and less on self-management /coping. This was a small study and the results should be interpreted with caution.

THU0734-HPR ASSESSMENT OF LOCAL DISEASE ACTIVITY AFTER AN INTENSIVE HAND EXERCISE PROGRAM IN PATIENTS WITH RHEUMATOID ARTHRITIS MEASURED BY ULTRASOUND IMAGING: AN EXPLORATORY RANDOMIZED CONTROLLED TRAIL

C. Bartholdy, M. Henriksen, E. Wæhrens, K. Ellegaard[1,1]. *The Parker Institute, Frederiksberg, Denmark*

Background: In 90% of patients with rheumatoid arthritis (RA) the joints of the hand are affected, causing impaired hand function. In general, reduced strength and range of motion of the hand are seen in patients with RA.

Studies have shown positive effect on pain and function after exercise intervention for the hand in patients with RA. However, it is unclear if the disease activity in the joints of the hand is influenced by an exercise program.

Ultrasound imaging (US) is shown to correlate with other markers of disease activity in RA and can be used as a surrogate measure for inflammation in the joint, as US visualizes synovial hypertrophy and increased blood flow.

Objectives: To investigate if intensive hand exercise combined with joint protection education for the hand in women with RA can be conducted without a negative effect on the disease activity in the wrist and metacarpal (MCP) joints.

Methods: This is a sub-study of a randomised clinical trial investigating hand exercise therapy as add on to education in joint protection during activities of daily living (ADL) performance. The intervention group (IG) had both ADL education and exercise therapy and the control group (CG) had only ADL education.

The participants were women with RA involving the hand who had been on stable medication for at least three month.

At baseline all participants were examined by a rheumatologist. The joints were examined, blood samples collected and pain and strength of the hand were measured. Patient's functional ability was assessed using the Assessment of Motor and Process Skills (AMPS). US examination of the wrist and MCP 2–5 dorsal and volar in both hands was made. In the US examination both the amount of synovial hypertrophy and increased blood flow (Doppler activity) was evaluated. The evaluated was made according to a validated scoring system sum. (1)

After baseline examination the patients were randomised to either IG or CG.

The hand exercise program contained both range of motion and strengthening exercises for the finger, wrist, elbow and shoulder joints. The exercise program was conducted four times a week for eight weeks, once a week supervised by a physiotherapist, to avoid overload of the joints and to progress the exercises if possible.

After eight weeks all baseline measures were repeated and change from baseline was calculated using the per protocol approach.

Results: Fifty five women with RA were included in the study (IG: 28; CG 27).

US score and CRP change from baseline:

	Intervention group (n=22) Mean (SD)	Control group (n=25) Mean (SD)	Difference Between groups Mean (95%CI)	P value
Baseline US synovial hypertrophy	18.38 (16.25)	21.68 (23.66)		
Baseline US Doppler	6.57 (12.48)	7.24 (13.15)		
Baseline US sum score	23.82 (27.18)	28.92 (35.97)		
Baseline CRP	4.95 (6.96)	3.71 (3.70)		
Change US synovial hypertrophy	0.57 (3.93)	1.8 (7.16)	-1.23 (-4.74-2.28)	0,36
Change US Doppler	-0.33 (4.62)	0.92 (8.20)	-1.25 (-4.28-1.77)	0,52
Change US sum score	0.23 (6.90)	2.72 (13.63)	-2.50 (-7.74-2.76)	0,43
Change CRP	-0.86 (6.13)	1.86 (3.71)	-2.71 (-5.67-0.23)	0.10

Eight withdraw during the study period, six from the IG and two from the CG. Thus, 22 from the IG and 25 in the CG were included in the final analysis. The mean age 63.6 (12.6) years and mean disease duration was 12.7 (11.3) years, baseline mean tender and swollen joint were 4.8 (4.7) and 1.3 (1.7), respectively. No differences in change from baseline in tender joint count, hand pain and strength and functional ability was seen between the two groups (data not shown). The mean score and change from baseline in US score and inflammatory marker (CRP) in the blood are seen in table below.

Conclusions: Women with RA of the hand experience no negative effect on the disease activity in the joints of the hand after eight weeks combined hand exercise and joint protection education.

THU0735-HPR SHARED CARE OF RHEUMATOLOGIST AND NURSE CONSULTATIONS IN FOLLOW UP OF RHEUMATOID ARTHRITIS AND SPONDYLOARTHRITIS OUTPATIENTS WITH LOW DISEASE ACTIVITY: A MONOCENTRIC, RANDOMIZED CONTROLLED TRIAL

K. Claes[1], A. Van Hecke[2], P. Jacques[1]. *[1]Rheumatology; [2]Centre of nursery and midwifery, University Ghent, Ghent, Belgium*

Background: Due to national regulations, the role of nurses in the management of arthritis patients differs significantly in all European countries (1). In Belgium, regularized consultations conducted by a rheumatology nurse do not exist.

Objectives: The study investigated whether rheumatology nurse consultations alternating with rheumatologist consultations for RA or AS patients with low disease activity is non-inferior compared to the usual care by the rheumatologist. Primary outcomes were safety and disease activity. Secondary outcomes were fatigue, pain, functional index, patient satisfaction, the level of self-management and self-efficacy.

Methods: This is a monocentric randomized controlled trial. The intervention group received a consultation conducted by a rheumatologist alternating with a nurse consultation, every 8 weeks. Patients in the control group received usual care: consultations performed by a rheumatologist every 8 weeks.

Results: Mixed method analyzes were performed. No statistical significant between-group effects were found nor in the RA group nor in the AS group, although there was a clinical relevance towards disease activity by AS patient in the intervention group. DAS 28 dropped with a mean difference of 0,4 (-1,1 – -0,2, SD 0,30). The ASDAS and BASDAI both decreased with 1.1 (-1,4 – -1,3, SD 0,1 and -1,7 – -1,4, SD 0,1 respectively). No safety signals from biochemical parameters such as SGOT, GOT and creatinine were detected. Inflammatory markers (ESR and CRP) remained stable in both groups. The secondary outcomes showed no significant between-group effects for both diseases. The self-efficacy outcome noticed a positive in-between-group effect by patients with RA in the intervention group.

Conclusions: In the follow-up of patients with RA or AS and low disease activity, outcome is not different when rheumatology nurse consultations alternating with rheumatologist consultations are compared to usual care. Implementing nurse consultations can positively influence the disease activity and patient self-efficacy.

THU0736-HPR EFFICACY OF DIFFERENT TYPES OF EXERCISE PROGRAMS IN OSTEOPOROSIS WITH HIGH RISK OF FALLS

K. Kazár-Tóth[1], C.K. Karóczi[1], B. Monek[1], C. Gácserné[1], É. Kovács[2], G. Poór[1], I. Mikó[1]. *[1]National Institute of Rheumatology and Physiotherapy; [2]Semmelweis University, Institute for Applied Health Sciences, Budapest, Hungary*

Background: While ageing the frequency of osteoporosis increases. The most frequent risk factor is falling and consequently bone fractures which in this population is associated with high mortality. According to WHO data, 28–35% of elderly over 65 years falls at least once per year, which increases to 32–47% over 70 years.
Objectives: The purpose of this randomized control study was to investigate the efficacy of a land-based and water-based exercise program specifically targeting balance to reduce fall risk in patients over 65 years with osteoporosis. We assumed that water-based training program would develop balance efficiently even at elderly people with severe degenerative diseases. Coordination in water is possible to be developed efficiently.
Methods: The study was carried out in the National Institute of Rheumatology and Physiotherapy. 61 participants were randomized [n=20 sensorimotor training group, n=20 control group (CG)] in the land-based sensorimotor training program (SMT) and 21 people [n=7 Ai Chi group (AC), n=7 water adapted sensorimotor training group (WASM), n=7 control group] in the water-based training program (WBT). The control group did not participate in any training program. The exclusion criteria were neurological, cardiovascular and musculoskeletal diseases, which contraindicated the participation in the training program. Functional Reach Test (FRC), Timed Up and Go Test (TUG), Star Excursion Balance Test (SEBT) and coordination test by stabilometer were used to measure static and dynamic balance. The measurements were performed before and after the training period. The results of the SMT were analyzed with two-sample t-test, and the results of the WBT with non-parametrical methods. The results were defined with $p<0,05$ statistical margin by SPSS program.
Results: After 18-weeks of the SMT program significant improvement was experienced in the SMT group compared to the CG with the following parameters: FRC ($p<0.001$), TUG ($p=0.01$). In the coordination test no significant difference was found between the SMT and the CG ($p=0.09$). After 8-weeks of the WBT programs significant improvement in the mediolateral direction of SEBT was detected in the WASM ($p=0.028$) and in the AC group ($p=0.043$) compared to the CG. FRC test was shown marginal significance ($p=0.075$) in the WASM group, while at the AC group remarkable improvement ($p=0.043$) was recognised compared to the CG. In the TUG test significant improvement was found in the CG and the WASM ($p=0.028$, $p=0.043$) compared to the CG.
Conclusions: The findings from this study support the efficacy of the land- and water-based exercise programs in improving balance in this sample. Our results pointed out that balance improved efficiently even at degenerative joint diseases. Limitations of our research was the small number of the participants and the short duration of the program. In the light of the promising outcome we will continue our research that would result in an efficient fall prevention in this population with high risk of falling.

THU0737-HPR EXPERIENCES AND APPRECIATION OF SHARED MEDICAL APPOINTMENT OF YOUNG ADULTS WITH A RHEUMATIC DISEASE, IN TRANSITION FROM CHILD TO ADULT CARE

L. Gossens[1], J. Ammerlaan[1], L. Cazemier[1], H. Bouwens[2], B. Formsma[2], J. van Laar[1], A. Kruize[1]. *[1]Rheumatology and Clinical Immunology; [2]Patient partner, UMC Utrecht, Utrecht, Netherlands*

Background: Young adults with rheumatic diseases deal with questions and uncertainties since their disease and treatment affect both physical and socio-emotional development[1,2]. As part of the transition from child to adult care, the UMC Utrecht offers a shared medical appointment (SMA). During a SMA, four to six patients are seen together in the presence of a doctor and nurse specialist. Compared to an individual consultation with a doctor or nurse, a SMA is offering extensive exchange of information and shared experiences focussed on everyday life, as sport, study, work and treatment[3]. During a SMA, patients learn from each other, which supports self-management. In practice, the care providers notice that young adults are reluctant to join a SMA, they hesitate to have a consultation in presence of their peers. When invited, most patients, however, do attend a SMA, and it is unknown how these young adults experience and appreciate the SMA. This evaluation is a first step of a larger project. The results will be deepened and supplemented with the findings on interviews with young adults and professionals, in order to give an advice for further development of the SMA in our clinic.
Objectives: Evaluating experiences and appreciation of SMA in transition patients in order to further develop the SMA in our clinic.
Methods: In the period of January 2014 till December 2016, patients in transition who participated in SMA were asked to fill in an evaluation questionnaire. This questionnaire focussed on expectations, quality of medical care compared to an individual consultation, information about disease and treatment during a SMA and the presence of other young adults. Data was analysed by the researchers and patient partners using SPSS and thematic analysis.
Results: Forty-five patients filled in the evaluation questionnaire, among them 35 women, with an average age of 19.6 years. The majority had a form of juvenile idiopathic arthritis (n=39); with average disease duration of 9,4 years and most were using a DMARD and/or biological (n=35). The results showed that participating patients were just as satisfied with the medical care in a SMA compared to a regular consultation; they indicate that more information was given in a SMA and the presence of peers was experienced as pleasant. Most appreciated were sharing experiences, individual stories and tips. Personal attention and lack of privacy were perceived as less pleasant, moreover young adults expressed to find it difficult to discuss personal issues.
Conclusions: Although it is difficult to motivate the young adults to attend the SMA, whenever they do attend, they appreciate a SMA in positive way, especially on benefits of sharing information and meeting peers, when offered in addition to individual consultations with doctor and nurse.

THU0738-HPR PROMOTING PHYSICAL ACTIVITY IN RHEUMATOID ARTHRITIS: DEVELOPING A THEORY-BASED BEHAVIOUR CHANGE INTERVENTION

L. Larkin[1], A. Fraser[2], S. Gallagher[3], N. Kennedy[1]. *[1]Department of Clinical Therapies, University of Limerick; [2]Department of Rheumatology, University Hospitals Limerick; [3]Department of Psychology, University of Limerick, Limerick, Ireland*

Background: Physical activity has numerous benefits for people who have RA, however interventions targeting physical activity behaviour in people who have RA have had limited efficacy [1].
Objectives: To develop a theory-based behaviour change intervention to promote physical activity in people who have RA.
Methods: Development was guided by the UK's Medical Research Council Complex Interventions framework [2] and consisted of three components;
1. Narrative review which explored the use of behaviour change theory in previous interventions
2. Systematic review which examined the content and structure of previous interventions
3. Qualitative study which explored the preferences of key stakeholders (people who have RA and health professionals) about the design of the intervention.
Results: Previous interventions lacked consideration of behaviour change theory in design and delivery, and there was a large degree of variance in content, structure and delivery. Lack of knowledge of current physical activity

Intervention	Overview	Detail
Aim	Promote physical activity	Time spent in moderate-intensity aerobic activity
Participants	Adults (18 years+), diagnosis of RA	Newly-diagnosed
Outcome measures	Physical activity (time spent in moderate-intensity ADLs)	ActivPAL™ activity monitor
	Physical activity beliefs, Self-efficacy, Quality of life, Pain, Fatigue	To be determined at protocol stage
Mode	Face-to-face	Initial 1:1 session, follow-up in group sessions
Location	Community location	Local health or community centres
Deliverer	Health professional (credible source)	Physiotherapist
*Content	Education	4.1 Instruction on how to perform a behaviour, 5.1 Information about health consequences, 5.2 Salience of consequences, 1.1 Goal setting (behaviour), 1.2 Problem solving
	Enablement	1.4 Action planning, 1.5 Review behaviour goals, 2.2 Feedback on behaviour, 2.3 Self-monitoring of behaviour, 6.1 Demonstration of behaviour, 6.2 Social comparison
	Modeling	8.1 Behavioural practice/rehearsal
Control	Education	1 group information session on physical activity

ADL = activities of daily living; RA = Rheumatoid arthritis
*As per Behaviour Change Wheel (Michie et al 2014)

recommendations for people who have RA was highlighted in the qualitative study, and delivery preferences were identified. Intervention development was mapped to the Behaviour Change Wheel [3] and employed the Theory of Planned Behaviour as it's theoretical basis. The proposed intervention is outlined in Table 1.

Conclusions: We have developed a theory-based intervention which considers the preferences of key stakeholders. Future research will determine the feasibility and effectiveness of this intervention.

THU0739-HPR THE PHENOMENON OF ALEXITHYMIA IN SYSTEMIC LUPUS ERYTHEMATOSUS PATIENTS

M. Ramkhelawon, R.A. Grekhoff, G. Suleymanova. *Rheumatology, Research Institute for Clinical and Experimental Rheumatology, Volgograd, Russian Federation*

Background: Alexithymia as a radical in the structure of premorbid personality is attracting the attention of researchers as one of the possible psychological risk factors in the development of psychosomatic disorders in rheumatic diseases. Clinical experience supports the evidence of the relevance of alexithymia conception in relation to the many somatic patients, who show a limited ability to describe and differentiate emotion and create fantasies, and hence indicate the role of alexithymia phenomenon in the pathogenesis of psychosomatic disorders in SLE.

Objectives: To study the relationship of the levels of alexithymia with other clinico-psychological characteristics.

Methods: 87 patients with systemic lupus erythematosus (SLE) was surveyed with the Toronto Alexithymia Scale (TAS).

Results: According to the results obtained, SLE patients demonstrated a high level of alexithymia (73,86±2,6 points). The results of the research showed that the level of alexithymia, on one hand, does not depend upon gender, age, character and activity of the pathological process ($p>0.05$). On the other hand, there was a significant inverse correlation between alexithymia and the level of the patient's education ($r = -0,42$ $p=0.031$). Moreover, internality in interpersonal interaction ($r = -0,44$ $p=0.028$), and significant direct correlation with indicators such as, the disease duration ($r = -0,46$ at $p=0.01$), the intensity of neurotic disorders (asthenia ($r = -0,42$ $p=0.033$), depression ($r = -0,52$ $p=0.006$), anxiety ($r =0.43$ $p=0.028$), hypochondriasis ($r = -0,48$ $p=0.01$), as well as psychological defense mechanism "Regression" ($r =0,42$ $p=0,022$).

Conclusions: Therefore, between the development of alexithymia in SLE patients and certain clinico-psychological characteristics, a particular association exists which provides a definite step for psychotherapeutic interventions aimed at correcting alexithymia personality traits of SLE patients.

THU0740-HPR INFLUENCE OF BIOFEEDBACK THERAPY ON THE MICRO-CIRCULATION IN SYSTEMIC SCLEROSIS

M. Ramkhelawon, R.A. Grekhoff, G. Suleymanova, S.A. Kharchenko. *Rheumatology, Research Institute for Clinical and Experimental Rheumatology, Volgograd, Russian Federation*

Background: Microcirculatory disorders are one of the most important clinical symptoms of systemic sclerosis (SSc), therefore we found it feasible to evaluate the clinical efficacy of biofeedback (BFB) in the complex therapy of patients with SSc based upon analysis of nailfold capillaroscopy.

Objectives: To study the impact of the method of biofeedback therapy on microcirculation disturbances in patients with SSc.

Methods: The study included 40 patients with SSc under observation. Among the patients examined, 95% were women and 5% were men. The average age of the patients - 38±3,3 years, duration of illness - 14±2,6 years. Raynaud's phenomenon (RP) was observed in all the patients. A severe form of RP was seen in 80% of the patients. The effectiveness of biofeedback therapy was analyzed by studying the dynamics of the measures from the nailfold capillaroscopy and comparing the data obtained of patients from the main and control groups.

Results: It was found that, patients who were under biofeedback therapy, showed significant positive dynamics in the following signs of capillaroscopic picture: dilation of the capillaries ($c2 =9,643$ $p=0,026$), morphological changes of the capillaries ($c2 =4,90$ $p=0,027$), and hemorrhage ($c 2 =4,514$ $p=0,034$). In the control group of patients, in only one indicator of capillaroscopy that a significant change was noted, particularly by the presence of dilated capillaries ($c2 =5,833$ with $p=0,016$). These findings suggest that treatment results were significantly better in the main study group of patients with SSc.

Conclusions: The implementation of biofeedback therapy favors a decrease in reflex musculo-tonic syndromes, improvement of microcirculation and peripheral blood flow and significantly allows an amelioration in the results of SSc therapy.

THU0741-HPR PLACEBO AND NOCEBO EFFECTS INDUCED BY CONTEXTUAL FACTORS. A SURVEY ON BELIEFS AND ATTITUDES OF ITALIAN MUSCULOSKELETAL PHYSIOTHERAPISTS

G. Rossettini[1], T. Geri[1], A. Palese[2], M. Fiorio[3], A. Viceconti[1], M. Testa[1]. *[1]Department of Neuroscience, Rehabilitation, Ophthalmology, Genetics, Maternal and Child Health, University of Genova, Savona; [2]Department Biological and Medical Science, University of Udine, Udine; [3]Department of Neurosciences, Biomedicine and Movement Sciences, University of Verona, Verona, Italy*

Background: Context effects are well known and were described as integral part of the clinical setting (1). The conscious use of contextual factors (CF) has been recently proposed as an effective modality capable to influence the physiotherapy outcome by facilitation of placebo responses. (2) To date, the knowledge about CF adoption in clinical practice of physical therapists is absent.

Objectives: The aim of this study was to investigate frequency of use, beliefs and attitudes about contextual factors among Italian physical therapists specialized in manual therapy (OMTs)

Methods: An invitation to participate in an online survey was sent to 906 OMTs through the database of the Master in Musculoskeletal Rehabilitation (MRDM) of University of Genova by SurveyMonkey Software®. These likely correspond to more than 85% of the whole OMTs population in Italy. A 17 items questionnaire and two clinical scenarios assessed behaviour, beliefs and attitudes of OMTs about CF adoption in clinical practice and data were analysed by descriptive statistic.

Results: 906 OMTs were invited to participate in the survey and 558 responded (62%). The majority of OMTs uses CF in their practice frequently (52%). They believe that an actual effect of CF can occur in acute pain (57%), chronic pain (78%) and rheumatologic disorders (56%). OMTs consider the use of CF ethically acceptable when it exerts beneficial psychological effects and their effectiveness was shown during clinical experience (31%). They disagree on the adoption of CF when they are based on deception, undermine the trust between OMT and patients, create legal problems or produce side effects (17%). 38% of respondents do not communicate the use of CF to their patients and they adopt CF as addition to other physical therapy interventions with the aim of optimizing clinical responses (20%). Expectation and psychological mechanisms are believed to be the main aspects behind placebo and nocebo effects induced by CF (7%).

Conclusions: The use of CF is quite common among Italian OMTs and they mostly had positive attitudes towards their use and effectiveness.

THU0743-HPR A NEW AND ALTERNATIVE TREATMENT IN SCLERODERMIC DIGITAL ULCERS

M. Muratore[1], D. Carati[2], L. Quarta[1], A. Grimaldi[1], E. Quarta[1], M. Garzya[1], D. Longo[1], O. Casilli[1], F. Calcagnile[1]. *[1]U.O. Reumatologia- P.O. "V. Fazzi" Lecce, LECCE; [2]Research & development, Ekuberg Pharma, MARTANO, Italy*

Background: Digital ulcers (DUs) are a major clinical problem for patients with systemic sclerosis (SSc). Patients with DUs may suffer from severe pain and often undergo a limitation of daily life activities, thus resulting in a functional impairment with a significant impact on the patient's health-related quality of life. Prevention of further complications and lesions is possible if the initial evaluation is performed early and correctly and if a treatment is started promptly.

Objectives: The primary objective is to demonstrate the effect of Lecoxen cream (Ekuberg Pharma, Italy) in comparison with another cream (Fitostimoline cream, DAMOR SpA, Italy) on the reduction of the number and size of DUs in patients with systemic sclerosis evaluating in addiction the reduction of pain dealing with DUs and quality of life.

Methods: In this single-blind randomized progressive trial 39 women, with confirmed digital ulcers present for at least 4 weeks with a surface area greater than 0.5 cm^2 but smaller than 2,5 cm^2, that follow Iloprost therapy (0,05mg/2 times/month), afferent to the Operative Unit (O.U.) of Rheumatology of the Local Health Unit (LHU) of San Cesario di Lecce, were randomized to receive the topical application of Lecoxen cream (group I: 20 women) or Fitostimoline cream (group II: 19 women). We took digital photographs to measure ulcer surface area and to draw the periwound area before the first cream application and after 30 days. Then an evaluation of DUs diameter and number was carried out. A

tailored questionnaire was administered as Visual Analogue Scale (VAS) during monitoring visits, to evaluate intensity of pain. Furthermore quality of life was monitored through Short Form (36) Health Survey.
Results: Mean age was similar in the two study groups with values of 45.4±5.6 years and 46.1±4.1 respectively. In the patients treated with Lecoxen cream, the reduction of lesion size was significantly higher (70%–75%) ($p<0,001$) in comparison with those registered in group II (40–45%) ($p<0,05$); a significant improvement was observed in levels of pain in Group I (30 days: $p<0,001$), while in group II the results of reduction were not significant. The analysis of SF36 survey showed highly significant reduction ($p<0,001$) of indexes in group I. At last visit, 32 ulcers were healed: 17 in the group I ($p<0,001$), 11 in the Group II ($p<0,01$). Two-way analysis of variance (ANOVA) test was used to examine differences. Intragroup changes were evaluated with the paired Student t-test. A p-value of <0.05 was considered to be significant.
Conclusions: Lecoxen cream showed the greatest effect on the mean reduction of the lesion size and pain levels. In the patients treated with Lecoxen cream the reduction of lesion size was 70%–75%; the reduction was smaller in the group II. At last visit, 32 ulcers were healed: 17 in the group I, 11 in the Group II. Data collected from SF36 surveys are very interesting, because they show a clear improvement in quality of life of scleroderma patients, who underwent three different treatments. In particular, a better subjective perception of tactile sensation and minor discomfort in the pathological skin have been reported. On the basis of the results, it could be argued that the medical device Lecoxen cream may be useful in the treatment of DUs in patients suffering from systemic sclerosis.

THU0744-HPR ASSESSMENT OF ADALIMUMAB SUBCUTANEOUS INJECTION RELATED PAIN AND EFFECTIVENESS OF NURSE SUPPORT FOR PATIENTS WITH RHEUMATOID ARTHRITIS

M. Fusama[1], M. Suzaki[2], T. Hirasawa[3], M. Takemoto[4], Y. Asano[4], K. Higashi[1], T. Tsuru[2], K. Tanimura[5], M. Natsumeda[6], H. Nakahara[7]. *[1]Division of Nursing, NTT West Osaka Hospital, Osaka; [2]PS Clinic, Fukuoka; [3]Division of Nursing, Hokkaido Medical Center for Rheumatic Diseases, Sapporo; [4]Division of Nursing, Sweet Hospital, Kurashiki; [5]Hokkaido Medical Center for Rheumatic Diseases, Sapporo; [6]Sweet Hospital, Kurashiki; [7]NTT West Osaka Hospital, Osaka, Japan*

Background: Subcutaneous injection of biologic agents gives more freedom and independence for patients with rheumatoid arthritis (RA) than intravenous injection. Despite this, patients with RA sometimes select intravenous injections due to concerns over self-injection, such as injection anxiety, including pain, and lack of confidence in giving a self-injection [1]. It is reported that one in five people are estimated to experience injection anxiety [2]. Therefore, an understanding of subcutaneous injection pain and anxiety and support for anxiety of patients with RA are important for appropriate usage of subcutaneous biologics.
Objectives: The aim is to evaluate pain and anxiety caused by adalimumab (ADA) subcutaneous injection and assess the effectiveness of nurses' care.
Methods: Patients with RA using ADA self-injections were enrolled. Pain was assessed in 4 categories: general, needle insertion, drug injection, needle removal. Pain was evaluated using Visual Analogue Scale (VAS) scale. Effectiveness of support by nurses was also assessed using self-questionnaires and free-format comments. Statistical analyses were performed utilizing Wilcoxon's signed rank test and Spearman's rank correlation coefficient.
Results: Twenty patients (Male: Female, 4: 16) completed the questionnaire. Average age and disease duration were 68 and 12.6 years, respectively. Mean ± SD of Pain VAS were 34.9±28.1 mm (General), 30.3±30.6 mm (needle insert), 42.5±35.6mm (drug injection) and 11.8±18.4mm (needle removal). There were no statistically significant differences between general pain and needle insertion ($p=0.631$), or general pain and drug injection ($p=0.121$). However, statistically significant differences were found between general pain and needle removal ($p=0.001$). Moreover, there were statistically significant differences between needle insertion and removal ($p=0.003$), and drug injection and needle removal ($p=0.00048$). General pain showed statistically significant correlation with needle insertion pain ($r=0.653$, $p=0.0018$) and drug injection pain ($r=0.615$, $p=0.004$). However, general pain was not correlated with needle removal pain ($r=0.137$, $p=0.565$).
Patients with RA answered that support by nurses was effective for relieving pain (30%), reduction of anxiety (35%) and improving treatment motivation (50%). According to the patients, nurses helped raise motivation by explaining that treatment prevents the progression of RA and allows many patients to feel better and have less pain. Interaction with nurses appears to be effective in reducing injection pain and anxiety and improving motivation for self-injection treatment.
Conclusions: These data indicate that needle insertion and drug injection pain have great influences on general pain. Support by nurses is likely to reduce injection anxiety and pain, resulting in higher motivation toward self-injection treatment.

THU0745-HPR A COMPARİSON THE EFFECTİVENESS OF WHOLEBODY VİBRATİON, PROGRESSİVE RESİSTİVE EXERCİSE AND HOME-BASED EXERCİSE İN PATİENTS WİTH KNEE OSTEOARTHRİTİS

M. Pekesen Kurtça[1], U. Baş Aslan[1], E. Kuyucu[2]. *[1]Physical Therapy and Rehabilitation, Pamukkale University, Denizli; [2]Orthopedics and Traumatology, Medipol University, Istanbul, Turkey*

Background: Knee osteoarthritis (OA) is the most common type of lower extremity OA. Systematic reviews of randomized controlled trials (RCTs) indicate that exercise therapy reduces pain and patient-reported disability in patients with knee osteoarthritis (OA), but to date, type and the optimal exercise regimen has not been identified.
Objectives: The aim of our study was to determine the effects of whole body vibration training exercise, progressive resistive exercise, home-based exercise used in osteoarthritis treatment on pain, muscle strength, functional status and quality of life.
Methods: Fourty five patients (mean age=53,86±5,33 years, 43 female, 2 male) diagnosed with bilateral knee osteoarthritis (Grade II-III, Kellgren &Lawrence) were included in this study. The assesments were performed at baseline, after third months when they completed the exercise programme and sixth months. Whole body vibration exercise training in Group-1; progressive resistive exercise training in Group-2; home-based exercise training in Group-3; were applied for three days per week, three months, totally 36 sessions. All the groups were included patient education programme at baseline. The pain was assesed according to Visual Analog Scale (VAS) and quadriceps muscle strength was evaluated by using Handheld dynamometry. The functional status of the patients was evaluated by WOMAC (Western Ontario and McMaster Universities) index and health related quality of life was evaluated by Nottingham Health Profile (NHP).
Results: Significant improvement was found after treatment on pain, quadriceps muscle strength, functional status and quality of life in all groups ($p<0.05$). When the groups compared by ANOVA it was found that outcome measures were not significantly different between Group-1, Group-2 and Group-3 ($p>0.05$).
Conclusions: Supervised resistive exercises and whole body vibration exercises were more effective in strengthening lower extremity muscles when compared to home exercise training in patients with knee OA. However, the increase in muscle strength was not observed at long- term follow- up in both groups. Neither whole body vibration exercise training programme nor progressive resistive exercise and home-based exercise programme were found to be superior for the treatment of osteoarthritis. All types of exercise training programmes were beneficial for pain, functional status, quadriceps muscle strength and quality of life. Further studies with long-term follow-up are warrented.

THU0746-HPR RHEUMATOLOGY NURSE SPECIALISTS AND DMARD PRESCRIPTION - WHERE ARE WE NOW?

M.K. Nisar[1], J. Begum[2]. *[1]Rheumatology, Luton & Dunstable University Hospital; [2]Rheumatology, Luton, Luton, United Kingdom*

Background: It is widely acknowledged that a multidisciplinary team approach is the best way to care for rheumatology patient group. The rheumatology nurse specialist (RNS) is an integral part of this multidisciplinary team. EULAR has published recommendations for their role in the management of chronic inflammatory arthritis (van Eijk-Hustings Y et al, 2012). The Department of Health also highlights the need for providing different models of care in a more cost effective way. It recognises that the nurse specialists' role is the bedrock of an effective care providing team and can contribute to answering the challenge of health provision in a financially difficult environment (Department of Health, 2008).
Objectives: We undertook a pilot survey to understand the present climate of rheumatology practitioners' prescribing of methotrexate in their practice.
Methods: "Learning Rheum" is a national initiative with an aim to establish a core curriculum for rheumatology nursing. Prior to its national meeting, the steering committee organised a focus group discussion of an ideal training structure to be able to successfully deliver DMARD education for patients. Methotrexate was accepted as index DMARD for the purpose of the exercise. A questionnaire

was created based on the discussion and all participants of the meeting were surveyed. Replies were compiled to ascertain the current picture of service delivery and educational training.
Results: 25 rheumatology specialist nurses participated in the exercise. Their job experience ranged from one week to 25 years (median 7 years). 21/25 (84%) ran independent clinics. 16/25 (64%) were employed at band 6. Five (20%) did not feel confident in counseling patients initiating methotrexate. Apart from two, no one had any formal training in delivering DMARD education. 10/25 (40%) had never been supervised whilst undertaking an educational session for patients. Six (24%) did not feel confident to teach or supervise their peers.
Conclusions: This is a pioneering survey mapping the training of rheumatology practitioners and nurse specialists to service delivery. This initiative highlights a wide variation in the training structure of a key job provision. There is lack of formal induction programme. Despite most participants running independent clinics and providing DMARD education for years, they confessed to have no formal education and little supervision. Over a fifth did not feel confident in counseling patients commencing methotrexate despite being in the job for a median of 18 months. Though most centres are delivering contemporary services, these are not being used effectively for developing key team members. A quarter of the cohort felt unprepared to impart the skills to peers (median experience 1 year).
In conclusion, there is wide variation in the training of rheumatology nurse specialists. This can potentially have a negative impact on a relatively young workforce. There is a need for improving training standards to help deliver good quality rheumatology professionals of the future.

THU0747-HPR EFFECT OF DIFFERENT PHYSICAL THERAPY PROGRAMS ON PAIN, STRENGTH AND FUNCTIONAL SITUATIONS ON KNEE OSTEOARTHRITIS

Ö.E. Günaydın, V. Bayrakcı Tunay. *Sports Physiotherapy, Hacettepe University, Ankara, Turkey*

Background: Knee Osteoarthritis (OA) is one of the most common causes of disability with an increasing prevalence and incidence with age. Although there are studies in the literature that examine the efficacy of ESWT, Kinesio taping and exercise on knee OA, there is no study to compare these methods with each other.
Objectives: The purpose of this study is to compare the effects of Extracorporeal Shockwave Therapy (ESWT), Kinesio taping and exercise therapy on pain, knee strength and functional situations of patients with knee osteoarthritis (OA).
Methods: Forty eight female patients aged between 50–65 and previously diagnosed with a grade 1–3 (Kellgren-Lawrence scale) knee OA included in this study. Patients were assessed before treatment and after treatment at 6 weeks and at 12 weeks. Visual Analog Scale, (VAS), (ISOMED®2000 D&R GmbH, Germany) isokinetic device, Timed Up and Go test (TUG) and WOMAC scale were carried out for assessing patients' pain, knee strength and functional situations. After randomising the patients into 3 different groups, the first group received 1 session of ESWT per 6 weeks, the second group received 2 sessions of Kinesio tape per 6 weeks and the third group was prescribed with an exercise program only.
Results: The between-groups results showed a significant improvement for the pain during night, pain during resting,and WOMAC test in the exercise group ($p<0,05$), while no difference was found for the other measurements ($p>0,05$). The inter-groups results showed significant improvements in 3 of the groups ($p<0,05$), while there was no difference in 60 degrees/sec isokinetic quadriceps strength test in the Kinesio taping group and TUG test in the ESWT group.
Conclusions: The results of this study showed that; ESWT, Kinesio tape and exercise therapies are all effective in decreasing pain intensity, improving knee strength and functional status levels of patients with knee OA and can be used as alternative approaches to treat symptoms of knee OA.

THU0748-HPR RECOMMENDATIONS ON PHYSICAL THERAPY PRESCRIPTION FOR AXIAL SPONDYLOARTHRITIS IN THE NETHERLANDS

S. van Weely[1], F. van der Giesen[1], N. Lopuhaa[2], F. van Gaalen[3], T. Vliet Vlieland[1]. *[1]Orthopaedics, Rehabilitation and Physical Therapy, Leiden University Medical Center, Leiden; [2]Dutch Arthritis Foundation, Amsterdam; [3]Rheumatology, Leiden University Medical Center, Leiden, Netherlands*

Background: In national and international guidelines physical therapy, comprising exercise interventions and education, is recommended as a required treatment modality for the optimal treatment of axial spondyloarthritis (axSpA). [1–3]. However, specific details regarding referral for physical therapy and optimal content and dose of exercise interventions are lacking. Research showed large variation in the content of exercise therapy in axSpA patients, which reflects suboptimal care [4].
Objectives: To develop practice recommendations on indications for referral, content, dose and safety aspects of exercise therapy for axSpA patients based on scientific evidence, expert opinion and patient values. The ultimate aim is improving the quality of exercise therapy care for people with axSpA.
Methods: The recommendations are based on scientific evidence, expert opinion and patient values and were formulated following a combination of literature review and three expert-group meetings (consisting of patients, rheumatologists, physical and exercise therapists, policy makers, scientists and special interest groups). In three consecutive expert-meetings clinically relevant questions, draft recommendations based on systematic literature reviews, and final recommendations including level of agreement were generated. Lastly, a field consultation among physical and exercise therapists, rheumatologists, scientists and special interest groups will be scheduled and an implementation strategy, comprising of an information intervention and directives, will be developed.
Results: In the first expert-group meeting 18 clinically relevant questions were formulated, on: indication and referral, assessment, content of treatment, evaluation and safety. In addition to recently published systematic reviews, additional literature reviews concerned assessment, safety and the dosage of exercise therapy. Related to the clinical questions, a framework for the therapeutic process and 12 draft recommendations were developed and discussed in the second meeting. In the third and last meeting the 12 recommendations regarding the delivery of physical therapy and exercise interventions were set and the level of agreement was determined.
Conclusions: The expert-meetings and literature searches led to 12 practice recommendations and a clear starting point for the development of the implementation strategy. Twelve practice recommendations regarding the delivery of physical therapy for patients with axSpA were developed, based on scientific evidence, expert opinion patient values. The field testing and development and execution of a dissemination and implementation strategy will be done in 2017.

THU0749-HPR INCREASING PHYSICAL ACTIVITY IN PEOPLE WITH A CHRONIC DISEASE: EXAMINING THE EFFECTIVENESS OF A MOTIVATIONAL AND A PLANNING INTERVENTION, THEIR INTERACTION AND VARIOUS POTENTIAL MODERATORS AND MEDIATORS

S. Hilberdink[1], G.-J.Y. Peters[2]. *[1]Allied Healthcare Centre for Rheumatology and Rehabilitation, Groningen; [2]Psychology and Education Science, Open University of the Netherlands, Heerlen, Netherlands*

Background: Physical activity has many health benefits, especially in people with a chronic disease. Behaviour change interventions appear more effective than just advice when increasing physical activity. However, most studies that compare different interventions overlook interaction effects between methods and their parameters for effectiveness.
Objectives: Present study examined the effectiveness of a motivational and an action planning intervention for increasing physical activity in patients with a chronic disease. Their interaction as well as various potential moderators and mediators were studied in order to identify which intervention is effective in which patients.
Methods: In a healthcare centre specialised in the treatment of people with a chronic disease, participants whose physiotherapist would advise them to be more physically active were randomly assigned to one of four interventions in a factorial design: 1) a control condition with only advice, 2) a motivational intervention

with information about health benefits and selecting personally relevant motives and social support sources regarding physical activity, 3) an action planning intervention in which participants specified which physical activities they would do, when, where and for how long and 4) a combination of these interventions. Prior to the intervention, participants' leisure time physical activity in the past week was measured with items from the SQUASH. Also behavioural intentions, expected social support and planning behaviour with regard to leisure time physical activity were measured. Directly after the intervention, positive outcome expectations and self-efficacy were measured. After a week, physical activity measures were administered again.

Results: 208 Participants (71% female; mean age 62 years; 40% with a rheumatic disease) completed the study. Figure 1 displays the average change in physical activity for each intervention. Multiple regression analyses showed that both the motivational intervention (β=0.22) and action planning (β=0.31) significantly predicted a positive physical activity change and that these effects appeared additive as opposed to catalytic. The effects were not moderated by intention, expected social support or planning behaviour, nor mediated by outcome expectations or self-efficacy. The motivational intervention's effectiveness was weakly correlated with the number of personally relevant exercise motives identified (r=0.22) and the action planning's effectiveness was weakly related to the number of plans made (r=0.19) and to one's outcome expectations after the intervention (r=0.21).

Conclusions: These data suggest that using a motivational or action planning intervention seems beneficial for increasing physical activity in patients with a chronic disease, independent of one's intentions, expected social support and planning behaviour. The data also suggest that action planning is preferable over a motivational intervention and that the added value of a motivational intervention is minimal if action planning is used.

This study was limited by only measuring physical activity after a week and by using self-report. Future studies should investigate longer term effects, other potential moderators and mediators and interaction effects between other promising behavioural change methods.

THU0750-HPR THE EFFECTIVENESS OF THERAPEUTIC FOOTWEAR IN PATIENTS WITH RHEUMATOID ARTHRITIS: A SYSTEMATIC REVIEW AND META-ANALYSIS

M. Tenten-Diepenmaat[1], M. Leeden van der[1,2], T. Vliet Vlieland[3], L.D. Roorda[1], J. Dekker[2,4]. *[1]Amsterdam Rehabilitation Research Center, Reade; [2]Department of Rehabilitation Medicine, VU University Medical Center, Amsterdam; [3]Department of Orthopaedics, Rehabilitation and Physical Therapy, Leiden University Medical Center, Leiden; [4]Department of Epidemiology and Biostatistics, Amsterdam Public Health research institute, VU University Medical Center, Amsterdam, Netherlands*

Background: Therapeutic footwear is recommended in guidelines for the treatment of foot problems in patients with rheumatoid arthritis (RA) and commonly prescribed and frequently used, especially in patients with established RA, foot deformities or erosions in foot joints.

Objectives: The objectives of this study were to summarize the effectiveness of therapeutic footwear on foot function, pain, physical functioning, health-related quality of life, adherence, adverse events and patient satisfaction in patients with RA.

Methods: All randomized controlled trials, randomized controlled cross-over trials, (quasi-experimental) clinical trials, and uncontrolled studies investigating the effect of therapeutic footwear in patients with RA related foot problems were included. Therapeutic footwear consists of custom-made or ready-made shoes. A literature search was conducted in The Cochrane Central Registry for Controlled Trials (CENTRAL), PubMed, EMBASE and PEDro up to January 19, 2017. Selection and inclusion of articles, data extraction (using a standardized template) and assessment of methodological quality (using a checklist for between-group and within-group comparisons) was conducted by two independent reviewers. Quantitative data analyses was conducted, when quantitative data analysis was not possible qualitative data analysis was performed.

Results: Thirteen studies were identified. In five studies, one of which was of high quality, between-group differences were reported. In twelve studies, of which two were of high quality, within-group differences were reported. Qualitative data-syntheses for the within-group differences of custom-made therapeutic footwear resulted in weak evidence for the reduction of foot pain and improvement of physical functioning. Quantitative data-analyses of the within-group differences of ready-made therapeutic footwear resulted in a medium to large effect for the reduction of foot pain (SMD -0.68, 95% CI -1.00 to -0.37; P=0.0001; 162 participants), and a small to medium effect for the improvement of physical functioning (SMD -0.32, 95% CI -0.62 to -0.02; P=0.04; 128 participants). Qualitative data-analyses of the between-group differences of ready-made therapeutic footwear resulted in inconclusive evidence for foot pain and physical functioning.

Conclusions: In within-group designs, there is weak evidence for the reduction of foot pain and improvement of physical functioning after wearing custom-made therapeutic footwear. Furthermore, in within-group designs there is a medium to large effect of ready-made therapeutic footwear on the reduction of foot pain, and a small to medium effect on the improvement of physical function. Controlled, between-group designs resulted in inconclusive evidence. A definite RCT is necessary to investigate the between-group effectiveness of therapeutic footwear in patients with RA.

THU0751-HPR EFFECTIVENESS OF FOOT ORTHOSIS IN PATIENTS WITH RHEUMATOID ARTHRITIS RELATED TO QUALITY OF LIFE AND PAIN. A SYSTEMATIC REVIEW AND META-ANALYSIS

G. Gijon-Nogueron, L. Ramos-Petersen, S. Garcia-Mayor, J.M. Morales-Asencio. *Nursing and Podiatry, University of Malaga, Malaga, Spain*

Background: Foot pain and deformity is almost ubiquitous in RA and results in considerable physical and psychosocial impairment [1]. Epidemiological studies consistently suggest a 90% prevalence of foot pain despite advances in pharmacological therapy [2]. Mechanical and other non-pharmacological interventions such as orthoses and footwear, have an important role in managing foot pathology in patients with their systemic disease controlled [1,3]. The effectiveness of treatment with insoles, especially in early periods, was studied in a randomized controlled trial, which results suggested an immediate clinical improvement, reducing foot pain, disability and limited functionality.[1]

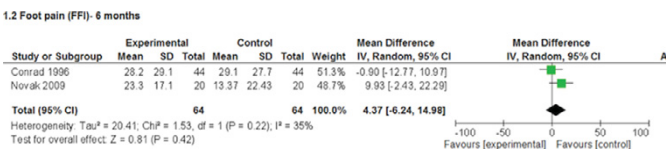
Objectives: The aim of this study is the effectiveness of foot orthosis in patients with rheumatoid arthritis in terms of quality of life and pain.

Methods: A systematic review and meta-analysis was conducted of randomized controlled trials.

Participants: Patients with rheumatoid arthritis were included. The criteria of exclusion were Juvenile Rheumatoid Arthritis, analysis of gait,

Intervention: Studies had to compare foot orthosis

Comparison: Other type of treatments, other type of foot orthosis, sham



Outcomes: Evaluation of Pain or Quality of life with any tool that measure this outcomes

The search was conducted in Cochrane, CINAHL, PubMed, EMBASE, LILACS, and Cuiden. An independent peer review was carried out. The Mesh term and fields used were foot, ankle, joint, rheumatoid arthritis, foot, orthosis, insole, foot orthosis.

Results: After the analysis of 71 studies, 4 were included for the systematic review. The 4 studies enrolled 285 participants. Follow-up periods varied from 6 to 30 months.

Only two studies were included in the meta-analysis [4,5], both of them with pain (measured with Foot Function Index) as the selected outcome.

A meta-analysis of the two trials showed that use of FO resulted in a non-significant improvement in disability compared with control (MD (95% CI): 4.37 (-6.24, 14.98); N=64) (Figure 1).

Conclusions: Foot orthoses showed improvements in pain and disability/quality of life, but no significant differences between groups were found.Future research needs to increase the number of RCTs in this topic because results are not conclusive.

Background: Use of non-surgical treatment modalities in osteoarthritis (OA) is suboptimal[1], which might be influenced by patients' beliefs about treatments. An instrument for measuring treatment beliefs in OA is not available yet.
Objectives: To develop a questionnaire assessing patients' beliefs about treatment modalities of hip and knee OA: the "Treatment beliefs in OA (TOA) questionnaire" and to evaluate its clinimetric properties.
Methods: The item pool, drawn from two previous qualitative studies, comprised beliefs regarding 5 treatment modalities: physical activity, pain medication, physiotherapy, injections and arthroplasty. A draft questionnaire comprising beliefs on these 5 treatment modalities was developed (200 items, Table 1). Two samples of patients with knee or hip OA (N=840, N=700) were recruited from our hospital to test the clinimetric properties of the TOA questionnaire. Descriptive analyses, explorative factor analyses (EFA; sample 1) and confirmatory factor analyses (CFA; sample 2) were conducted for each treatment module separately. Internal consistency was assessed with Cronbach's Alpha (both samples). In order to examine test-retest reliability a subsample of sample 2 (N=67) was asked to fill out the final TOA questionnaire again after two weeks.
Results: 351 patients filled out the draft TOA questionnaire (sample 1), 289 patients filled out the final TOA questionnaire (sample 2), with a subsample (N=50) who filled out the final questionnaire twice. EFA yielded a two factor solution for each treatment modality. The factors were labeled "positive treatment beliefs" and "negative treatment beliefs". The final TOA questionnaire comprised 60 items; items per treatment modality ranged from 9 to 14. CFA showed adequate fit indices for physical activities and physical therapy, while fit indices for the treatment modalities pain medication, injections and arthroplasty just failed to reach adequate cut-off values. Internal consistency was good to excellent for the subscale positive treatment beliefs (Cronbach's α between 0.84 and 0.90), and mediocre to acceptable for the subscale negative treatment beliefs (Cronbach's α between 0.66 and -0.79). Test-retest reliability was satisfactorily to good with ICCs from 0.66 to 0.88 and SEMs from 0.17 to 0.52.

Table 1: Example items in the TOA questionnaire

Items TOA-questionnaire	Disagree				Agree
I think *[doing physical activities]* leads to risks	1	2	3	4	5
My quality of life improves through *[using pain medication]*	1	2	3	4	5
I think *[physiotherapy]* causes pain	1	2	3	4	5
I can do household chores more easily through *[an injection]*	1	2	3	4	5
I think *[a joint replacement]* is pervasive	1	2	3	4	5

Conclusions: The TOA questionnaire is the first questionnaire assessing positive and negative beliefs regarding five treatment modalities for knee and hip OA. The TOA questionnaire showed moderate structural validity and good internal consistency and test-retest reliability. The TOA questionnaire is useful for a better understanding of patients' treatment beliefs. Future research will examine how treatment beliefs, in interaction with other variables, influence treatment choices.

HPR epidemiology and public health (including prevention)

THU0753-HPR PREDICTING THE FUTURE DEVELOPMENT OF SPONDYLOARTHRITIS AMONG PATIENTS WITH IDIOPATHIC ACUTE ANTERIOR UVEITIS USING REAL-WORLD DATA

M. Haroon[1], K.A. Betts[2], F. Mu[2], M. Skup[3], J.K. Anderson[3], A.D. Joshi[3].
[1]Division of Rheumatology, University Hospital Kerry, Tralee, Ireland; [2]Analysis Group, Boston; [3]AbbVie Inc., North Chicago, United States

Background: Previous studies have suggested an association between idiopathic acute anterior uveitis (AAU) and spondyloarthritis (SpA), including showing that at least 40% of AAU patients have undiagnosed SpA. However, the clinical factors to predict the incident diagnosis or future development of SpA remain poorly recognized.
Objectives: The objectives of this study were: 1) to describe the patient characteristics of AAU patients with and without SpA diagnosis, and 2) to identify the predictive factors of SpA diagnosis among AAU patients using real-world data.
Methods: Adult patients with at least one diagnosis of AAU (ICD-9-CM: 364.01 or 364.02) were selected from a large US insurance claims database (01/01/2008–06/30/2015). The first AAU diagnosis was defined as the index date. Patients were required to have at least 6 months of continuous data availability before the index date. Patients with intraocular surgery, penetrating or blunt eye trauma, or a diagnosis of rheumatoid arthritis or SpA on or prior to the index date were excluded. Potential predictive factors for subsequesnt diagnosis of SpA included demographic characteristics, type of AAU (primary [first diagnosis] vs. recurrent), SpA-related comorbidities, and healthcare resource utilization prior to the index date. Factors predictive of SpA diagnosis were selected into a multivariable Cox proportional hazards model based on statistical significance and clinical relevance. Hazards ratios (HR) and p-values were estimated for each factor.
Results: A total of 48,822 patients with AAU were included, and among them, 1,032 patients were newly diagnosed with SpA during the follow-up period which was 24 months on average. Patients with SpA were younger (45.7 vs. 50.4 years), more likely to be male (52% vs. 42%), more likely to have recurrent AAU (44% vs. 29%), back pain (21% vs. 13%), SpA-related comorbidities including inflammatory bowel disease (IBD) (4% vs. 1%) and psoriasis (3% vs. 1%), and more likely to use corticosteroids (45% vs 40%). Predictive factors in the final Cox model were: male vs. female (HR=1.55; p-value$<$0.01), age$<$45 vs. $\geq$45 years old (1.65; $<$0.01), recurrent vs. primary AAU (1.94; $<$0.01), back pain under age 45 vs. no back pain (1.90; $<$0.01), back pain above age 45 vs. no back pain (1.46; $<$0.01), psoriasis (5.16; $<$0.01), IBD (2.50; $<$0.01), chiropractor/physical therapist visits (1.29; 0.01), conjunctivitis (1.23; 0.02), nonsteroidal anti-inflammatory drugs use (1.44; $<$0.01), use of conventional synthetic disease-modifying anti-rheumatic drugs (1.32; 0.05), joint pain (1.14; 0.19), imaging test use (1.03; 0.74), corticosteroids use (1.07; 0.33), and enthesitis/heel pain (1.13; 0.36). When sacroiliitis was included in the model, results remained largely similar.
Conclusions: There are significant differences among isolated AAU patients and AAU patients that developed SpA later. The most predictive factors of SpA diagnosis were male, age$<$45 years, recurrent AAU, back pain, and other extra-articular manifestations of SpA such as IBD and psoriasis. Since delayed diagnosis is common among SpA patients, identifying such predictive factors can help inform risk stratification.

THU0754-HPR WORK STATUS IN WOMEN WITH FIBROMYALGIA – A 12-YEAR FOLLOW UP STUDY

S. Johannesson[1], L. Nordeman[2,3], M. Joelsson[1], K. Mannerkorpi[2], A. Bergenheim[1,2,3]. *[1]Närhälsan rehabilitation centre, Region Västra Götaland; [2]Institute of Neuroscience and Physiology/Physiotherapy, Sahlgrenska Academy, University of Gothenburg, Gothenburg; [3]Närhälsan Research and Development Primary Health Care, Region Västra Götaland, Sweden*

Background: Fibromyalgia (FM) affects approximately 1–3% of the general population in the Western world and about 10% have been found to report Chronic Widespread Pain (CWP). The work ability is often affected in persons with FM and CWP. Previous research has shown a small improvement of symptoms over time in patient with FM and CWP. Sustain in work has been

shown to predict improvement in pain, pressure tenderness, fatigue, stiffness, depression, disturbed sleep, disease specific health, physical aspects and quality of life in persons with FM/CWP. There is lack of research about long-term follow-up of work status in FM and CWP. To enable patients with FM or CWP to sustain in work or return to work it is crucial to gain knowledge about which factors that can affect their work status in the long-term.
Objectives: To investigate change in work status and possible predictors of work status after 12 years in a cohort of women with FM and CWP.
Methods: In 2004, 166 women with FM and CWP participated in a randomized controlled trial in Sweden investigating effects of patient education and pool exercise. The 166 women were invited to participate in a follow-up study in 2016 in which long-term effects on work status, aspects of health and physical function were investigated. 126 participated in the follow-up study of which 98 were <65 years of age (age of retirement in Sweden) and included in the present study of work status. Data was collected by a standardized interview, a battery of questionnaires and an examination including tests of physical function. Work status refers to percentage of full-time work divided into four categories; 0%/1–49%/50–79%/80–100%. Wilcoxon's signed-rank test was used for comparisons of work status over time within the group.
Multivariable forward stepwise logistic regression was used for analyses of predictors of work status after 12 years. The dependent variable was work status dichotomized into <50%/≥50% work. Independent variables were baseline values of age, work status, symptoms of stress, pain intensity, overall health status, leisure time physical activity, walking capacity, health related quality of life and depression.
Results: The 98 women showed a significant increase in work status ($p<0.001$) at the 12 years follow-up. Proportions of work status in category 1–4 at baseline were 56%/10%/22%/10% and at follow-up it was 36%/11%/23%/28%. The participants' age, overall health assessed with Fibromyalgia Impact Questionnaire (FIQ) and health related quality of life assessed with SF-36 Physical component summary (PCS) at baseline predicted work status 10–12 years later. Age (years): OR 0.90 (95% CI 0.84–0.97), p=0.004. FIQ total score (0–100): OR 0.94 (95% CI 0.91–0.97), $p<0.001$. SF-36 PCS (0–100): OR 1.1 (95% CI 1.0–1.2), p=0.019.
Conclusions: Women with FM or CWP appear to improve their work status on group-level over time. Lower age, better overall health and higher health related quality of life at baseline were found to predict higher probability of working 50–100% after 12 years.

THU0755-HPR DIETARY PROTEIN INTAKE AND UPPER LEG MUSCLE STRENGTH IN PATIENTS WITH KNEE OSTEOARTHRITIS: DATA FROM THE OSTEOARTHRITIS INITIATIVE

A.H. de Zwart[1], M. van der Leeden[1,2], L.D. Roorda[1], M. Visser[3], M. van der Esch[1], W.F. Lems[1,4,5], J. Dekker[2,6]. *[1]Amsterdam Rehabilitation Research Center, Reade; [2]Dept of Rehabilitation Medicine, VU University Medical Center (VUmc); [3]Dept. of Health Scienses, section Nutrition and Health, VU university Amsterdam; [4]Dept of rheumatology, VU University Medical Center (VUmc); [5]Jan van Breemen Research Institute; [6]Dept of Psychiatry, VU University Medical Center (VUmc), Amsterdam, Netherlands*

Background: In patients with knee osteoarthritis (OA) muscle weakness is common and is strongly related to more pain and activity limitations. Therefore, conservative treatment focuses on optimizing muscle strength in patients with knee OA. Determinants of muscle strength such as muscle quantity and quality, level of pain and physical activity are widely studied in knee OA. Only a limited number of studies have focused on the relation between nutrition and muscle strength in patients knee OA.
Protein is an essential building block for muscle tissue. Adequate dietary protein intake is needed to preserve muscle tissue. In a part of the general older population lower intakes than the recommended daily protein intake are observed [1,2]. Higher levels of dietary protein intake have been linked to greater muscle mass and strength in older adults[3,4]. Whether there is an independent association between lower dietary protein intake and lower muscle strength in knee OA patients in unknown.
Objectives: To determine whether lower dietary protein intake is associated with lower muscle strength in patients with knee OA.
Methods: In this cross-sectional study, baseline data of patients with symptomatic and radiographic knee OA from the progression subcohort of the Osteoarthritis Initiative (OAI) were used. Protein intake was measured by the Block Brief 2000 food frequency questionnaire and expressed as g per day/ kg bodyweight. Knee muscle strength was measured in the index knee by the Good Strength chair test, and expressed as the sum of both flexion and extension strength (N/kg bodyweight). Linear regression analysis was used to test the association, adjusting for relevant demographic, clinical and behavioral confounders.
Results: Data from 1128 patients (mean age 61.7±SD 9.1 y., 60.4% female) were used. A Kellgren and Lawrence grade of 2, 3 or 4 was scored in 25.7%, 44.7% and 30.0% of the patients, respectively.The mean daily protein intake was 0.68±SD 0.26 g/kg bodyweight, and the mean muscle strength was 5.33±SD 1.96 N/ kg bodyweight. In the unadjusted model, lower protein intake was associated with lower muscle strength (B = -0.804, 95% CI -0.336 to -1.272, p=0.001). After adjusting for age and gender, lower protein intake was still associated with lower muscle strength (B = -1.102, 95% CI -0.680 to -1.524, $p<0.001$) and was maintained after controlling for other relevant confounders.
Conclusions: Lower protein intake is independently associated with lower muscle strength in patients with knee OA. To confirm this relationship, future research is needed to test this association in longitudinal and interventional studies in patients with knee OA.

HPR patients' perspectives, functioning and health (descriptive: qualitative or quantitative)

THU0756-HPR PREDICTORS OF FEAR OF MOVEMENT IN PATIENTS WITH RHEUMATOID ARTHRITIS

G.I. Kinikli[1], H. Guney[1], S. Karahan[2], A. Ates[3], M. Turgay[3], G. Kinikli[3]. *[1]Department of Physiotherapy and Rehabilitation, Hacettepe University Faculty of Health Sciences; [2]Department of Biostatistics, Hacettepe University Faculty of Medicine; [3]Department of Rheumatology, Ankara University Faculty of Medicine, Ankara, Turkey*

Background: Rheumatoid arthritis (RA) is a systemic chronic autoimmune inflammatory disease characterized by synovial joint inflammation that results in functional limitations accompanied by social and psychological outcomes.
Objectives: The aim of this study was to investigate the association between fear of movement and age, upper and lower extremity functions and functional disability in patients with Rheumatoid Arthritis (RA).
Methods: A total of 88 patients with RA participated to the study. Disease activity was assessed using the Disease Activity Score in 28 joints (DAS28). Functional disability was assessed using the Health Assessment Questionnaire-Disability Index (HAQ-DI). The Disabilities of the Arm, Shoulder and Hand Score (QuickDASH) was used to assess the upper extremity function. The Western Ontario and McMaster Universities Osteoarthritis Index (WOMAC) was used to assess the lower extremity function. The Tampa Scale for Kinesiophobia (TSK) was used to assess pain-related fear of movement. The multiple stepwise linear regression model with R-square (R^2) was used to compare across the models and explain the total variance.
Results: Eight independent variables namely, age (r=0.215; p=0.044), QuickDASH (r=0.504; $p<0.001$), HAQ-DI (r=0.315; p=0.003), WOMAC Pain (r=0.512; $p<0.001$), WOMAC Stiffness (r=0.419; $p<0.001$), WOMAC Function (r=0.398; $p<0.001$), WOMAC Total (r=0.429; $p<0.001$), WOMAC range (r=0.419; $p<0.001$), demonstrated significant correlations with TSK. There were correlations between two independent variables (QuickDASH, p=0.013; WOMAC Pain, p=0.034) and TSK (R^2=0.293).
Conclusions: Health professionals should keep in mind that fear of movement were likely to cause poorer upper extremity functional disability and lower extremity pain levels in spite of varied drug therapies in patients with RA.

THU0757-HPR EUROPEAN QUALITATIVE RESEARCH PROJECT ON PATIENT-PREFERRED OUTCOMES IN EARLY RHEUMATOID ARTHRITIS (EQPERA): RATIONALE, DESIGN AND METHODS OF AN ONGOING MULTI-COUNTRY, MULTI-CENTER, MULTI-LANGUAGE, LONGITUDINAL QUALITATIVE STUDY

K. Van der Elst[1], A. Bremander[2], A. De Groef[1], I. Larsson[3], E. Mathijssen[4], J. Vriezekolk[4], R. Westhovens[1], Y. van Eijk-Hustings[5]. *[1]Rheumatology, University Hospitals Leuven, Leuven, Belgium; [2]Research and Development Center; [3]Spenshult Research and Development Center, Spenshult Hospital, Halmstad, Sweden; [4]Department of Rheumatology, Sint-Maartenskliniek, Nijmegen; [5]Department of Patient & Care/Rheumatology, Maastricht University Medical Center, Maastricht, Netherlands*

Background: Ample studies exist on outcome assessment from the patient perspective in Rheumatoid Arthritis (RA), but little is known about health and

treatment preferences of recently diagnosed patients, and how these evolve over time. A Belgian qualitative study has set the scene (1), but knowledge on cross-cultural nuances in patient-preferred outcomes is lacking. To this end, EQPERA – European Qualitative research collaboration on Patient-preferred outcomes in Early Rheumatoid Arthritis– was founded.
Objectives: EQPERA aims to unravel longitudinally preferences for treatment and health outcomes among patients with early RA across Belgium, the Netherlands and Sweden. To yield sound results, specific preparations for this cross-country qualitative study are reported here.
Methods: Several steps have been undertaken to ensure trustworthiness of findings and consistency across countries in sampling, interviewing, analysis and project management: a detailed research protocol has been written; the interview guides have been translated following a structured forward-backward linguistic validation process; templates for data collection and a quality assurance reporting tool have been developed; and local staff has been trained and supervised by the project leader in implementing the study protocol. Each country will document changes with sufficient detail in their research logbook.
Results: EQPERA will be a qualitative, explorative, longitudinal study with active involvement of patient researchers. In each country, a purposive sample of patients with early RA will be individually interviewed 3–6 months after start of the initial RA treatment and subsequently, the same participants will be invited back to take part in a focus group 12–18 months after RA treatment initiation. Data collection and analysis will be independently conducted by the local research teams in their native language. The local teams will analyze their interview data using the constant comparison method as detailed in Qualitative analysis guide of Leuven, after which Saldana's guiding questions will be adopted for analyzing change over time. Afterwards, a meta-synthesis of all locally gathered and interpreted data will be conducted to explore and describe patterns, similarities and differences across countries.
Conclusions: This European project is a first step in gathering contextual findings on patient-preferred outcomes in early RA. Such knowledge is of crucial importance for tailoring therapeutic approaches in a timely and meaningful way. Our innovative, qualitative, longitudinal research design goes beyond the abilities of the frequently used cross-sectional designs in qualitative research. Large, multi-national qualitative projects are scarce in rheumatology research, thus applied data management and quality assurance strategies could be of interest to other researchers.

HPR professional education, training and competencies

THU0758-HPR APPLICATION OF THE EULAR RECOMMENDATIONS FOR PATIENT EDUCATION FOR PEOPLE WITH INFLAMMATORY ARTHRITIS IN SWITZERLAND

K. Niedermann[1], C. Madelaine-Bonjour[2], M. Roffler[3], A. Kocher[4] on behalf of Health Professionals in Rheumatology Switzerland. *[1]School of Health Professions, Zurich University of Applied Sciences, Winterthur; [2]Rheumatology, University Hospital, Lausanne; [3]Swiss League Against Rheumatism, Zurich; [4]Rheumatology, University Hospital, Bern, Switzerland*

Background: The recently published EULAR recommendations for patient education (PE) in people with inflammatory Arthritis (IA) encompass two overarching principles and eight recommendations (1). The average overall agreement of PE experts with the recommendations is usually high (at least 8.8 (SD+/-0.5) on a 1–10 Numeric Rating Scale NRS) (1, 2). The recommendations ought to be disseminated and implemented to establish a core standard for delivering PE and training for health professionals (HPs) in delivering PE across Europe.
Objectives: The Swiss HPs in rheumatology organisation, hpr Switzerland, aimed to evaluate the current standard of PE as well as the agreement with and application of the EULAR PE recommendations in Switzerland, in order to develop further implementation steps.
Methods: An online survey was conducted among HPs and rheumatologists in the major rheumatology clinics (n=28) of the German and French part in Switzerland. The current knowledge and skills in PE and the performance of PE in clinical practice were assessed by multiple choice questions. The agreement with the PE recommendations was assessed on a 1–10 NRS and their application in the rheumatology clinics on a 4-point scale ("applied"/"rather applied"/"rather not applied"/"not applied").
Results: A total of 57 HPs, among them 12 rheumatologists, 21 nurses, 15 physiotherapists, 6 occupational therapists, 2 medical assistants) from 12 rheumatology clinics participated. Of these HPs, 31 (55%) worked for more than 6 years in rheumatology and 15 (27%) indicated to have a formal training in PE. They perceived that PE formed a substantial part of their work (33.5% on average), the most important element being "providing information" (48%), compared to 27% counselling and 25% behavioural interventions.
The average overall agreement with the PE recommendations was 7.0 (SD+/-2.25). Recommendations 3 and 7 were well applied (72%) in the rheumatology clinics. Least applied were the recommendations 4 and 6 with 21% and 24% respectively. Recommendations 1, 2, 5 and 8 reached between 40–50% application rates.
Image/graph shows Agreement with and Application of the PE Recommendations in Switzerland

Overarching principles
1. Patient education is a planned interactive learning process designed to support and enable people to manage their life with inflammatory arthritis and optimise their health and well being
2. Communication and shared decision making between people with inflammatory arthritis and their health care professionals are essential for effective patient education

Recommendations	Agreement mean (SD)	Application '(rather) applied')
1. PE should be provided for people with IA as an integral part of standard care in order to increase patient involvement in disease management and health promotion	7.03 (2.39)	42.4%
2. All people with IA should have access to and be offered PE throughout the course of their disease including as a minimum; at diagnosis, at pharmacological treatment change and when required by the patient's physical or psychological condition	6.79 (2.22)	48.5%
3. The content and delivery of PE should be individually tailored and needs-based for people with IA	6.68 (2.35)	72.7%
4. PE in IA should include individual and/or group sessions, which can be provided through face-to-face or online interactions, and supplemented by phone calls, written or multimedia material	7.08 (2.08)	21.2%
5. PE programmes in IA should have a theoretical framework and be evidence-based, such as self-management, cognitive behavioural therapy, or stress-management	7.08 (2.20)	48.5%
6. The effectiveness of PE in IA should be evaluated and outcomes used must reflect the objectives of the PE programme	7.05 (2.44)	24.2%
7. PE in IA should be delivered by competent HPs and/or by trained patients, if appropriate, in a multidisciplinary team	7.26 (2.26)	72.7%
8. Providers of PE in IA should have access to and undertake specific training in order to obtain and maintain knowledge and skills	6.82 (2.08)	42.3%

Conclusions: The overall agreement with the recommendations was high, although lower than the overall agreement of PE experts (1,2). The application of most recommendations was found to be moderate to low in Swiss rheumatology institutions; however no comparisons with other countries are available. "Providing information" was reported as the most important PE element. This emphasises the need to implement the PE recommendations as well as to improve HPs' knowledge on delivering and evaluating effective PE, in order to provide beneficial PE interventions for people with IA in Switzerland.

HPR interventions (educational, physical, social and psychological)

THU0759-HPR DOES PHYSIOTHERAPY AND REHABILITATION PROGRAM IMPROVE MOBILITY AND DAILY LIVING ACTIVITIES IN ELDERLY INPATIENT WITH OSTEOPOROSIS?

M. Karapinar[1], T. Firat[2], N. Kirdi[2]. *[1]Department of Physiotherapy and Rehabilitation; [2]Hacettepe University, Ankara, Turkey*

Background: Osteoporosis (OP) is a generalized skeletal disorder characterized by compromised bone strength and deterioration of bone quality, often leading to fragility. Elderly osteoporosis is being public health problem that highly affects people especially above 65 years. Physiotheraphy and rehabilitation programs are

important in the prevention and management of osteoporosis. Exercises improve mobility in elder inpatient by increasing activity, muscular strength, flexibility, and reducing the risk of falls and length of stay in hospital.

Objectives: The aim of our study was to investigate the effects of physiotherapy and rehabilitation program on mobility, physical activity and quality of life in elderly inpatient.

Methods: A hundred and twenty four patient with OP (mean age: 73,03±5,9) participated in this study. A total of patients who were randomized as study and control group followed by Hacettepe University Faculty of Medicine Department of Internal Medicine, Division of Geriatric Medicine Department of Physiotheraphy and Rehabiltation, Geriatric Rehabilitation Unit were, were included to the study. Assessment for cognitive function (Mini Mental State Test), functional mobility (De Morton Mobility Index), activities of daily living (Katz Index of Independence in Activities of Daily Living), quality of life (EuroQol-5D) were used at admission and discharge in hospital. Thirty minutes physiotherapy and rehabilitation program including breathing, balance and coordination and strengthening exercises was performed by the intervention group under supervision of physiotherapist during the stay in hospital. Control group did not special exercise, they continued their activities of daily living. exercise. Length of stay in hospital of all participant was recorded.

Results: Sixty two patients were randomly assigned to the each group.The groups were similar in sociodemographical feature ($p>0.05$). Improvements in mobility, quality of life and daily physical activity levels were found in the study group ($p<0.05$). There were no significant differences between control and intervention group in length of stay in hospital ($p>0.05$).

TABLE I. Results of the 3 primary outcome measures at admission and disharge for the two groups

		X± SD Admission	X± SD Discharge	p
DEMI	Intervention Group	50,64±20,59	57,82±22,35	**0,000***
	Control Group	47,91±22,01	48,56±21,72	0,346
Katz ADL	Intervention Group	14,30±3,13	15,98±2,91	**0,001***
	Control Group	14,35±2,42	14,61±2,44	0,769
EQ-5D	Intervention Group	9,87±4,74	9,58±4,65	**0,019***
	Control Group	9,50±2,24	9,51±2,17	0,776

X±SD : Mean ± Standart Deviations, DEMI : De Morton Mobility Index, KATZ : The Katz Index of Independence in Activities of Daily Living , EQ5D : The EuroQol

Conclusions: These results revealed the necessity of physiotherapy and rehabilitation program to prevent negative effects of the hospitalization process of the geriatric patients with osteoporosis.

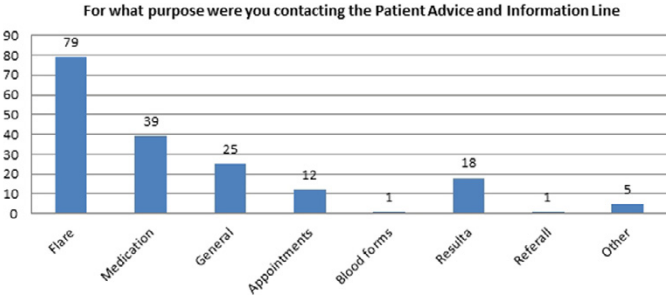
HPR service developments, innovation and economics in healthcare

THU0760-HPR PATIENT ADVICE LINE - THE POTENTIAL CLINICAL AND FINANCIAL BENEFITS TO A RHEUMATOLOGY DEPARTMENT



A. Mason, C. Beevor, J. Ledingham. *Portsmouth Hospitals Trust, Portsmouth, United Kingdom*

Background: EULAR recommendation 3 for the role of the nurse in the management of chronic inflammatory arthritis states that patients should have access to nurse-led telephone services to enhance continuity of care and to provide ongoing support (1). In the UK quality standard 6 of the National Institute for Health and Care Excellence guidelines for the care of rheumatoid arthritis (RA) recommends that people with RA and disease flares, or possible drug related side effects should receive advice within 1 working day of contacting the rheumatology service. In 2016 audit data from England and Wales show that 96% of trusts report being able to provide patients with a telephone advice line but no further detail on these services was available (2).

Objectives: Data from our patient advice line were collected over a 6 month period. The objective was to understand who was using the helpline, the speed of our response, how much of the workload could be managed by nursing staff and the clinical and financial impact.

Methods: All patient calls made to our patient helpline were recorded and data were collected prospectively on patient demographics, disease, purpose of call, response time and the cost and revenue produced. Patient feedback was collected via a questionnaire. Data were collected from April 2016 to November 2016.

Results: 150 patient calls were responded to. 108 calls were from females and were 42 from males. The majority of patients had RA (75/150). Other conditions are displayed in the graph below. The majority of calls were regarding a flare of their condition or medication queries (79/180 and 39/180 respectively) with some patients calling for more than one reason. 83% of calls were answered within 24 hours. A clinical nurse specialist is available to respond to calls over weekends. Income generated from responding to calls by the department was £ 1900 per month. Expenditure was £ 1650 per month. Patient satisfaction was high with 130/150 stating the main reason for the call was answered to their satisfaction (7 stating no, 13 not stated).

Conclusions: Our advice line gives patients easy access to specialist advice. Patient satisfaction is high. Responses are timely and fast. Multiple concerns are commonly addressed, such as advice regarding flare of disease and medication queries. This service will be

THU0761-HPR BIOLOGICAL THERAPY SURVIVAL: MULTI-CENTRIC ANALYSIS IN REAL CLINICAL PRACTICE CONDITIONS

D. Ybáñez García[1], J.J. Alegre-Sancho[1], A. Martínez-Cristóbal[2], J.A. Castellano Cuesta[3], M. Fernández Matilla[3], N. Fernández-Llanio Comella[3], I. Ríos-Martin[4], A.M. Martinez-Arroyo[4]. *[1]Rheumatology, H Doctor Peset, Valencia; [2]Rheumatology, H de la Ribera, Alzira, Valencia; [3]Rheumatology, H Arnau de Vilanova, Valencia; [4]I+D, PORIB GES, Paterna, Valencia, Spain*

Background: Biological treatment (BT) has changed the evolution of rheumatic diseases. A way to evaluate the effectiveness of BTs is considering therapeutic survival as an effectiveness subrogate marker

Objectives: To describe BT use; To evaluate BT survival in indications according to product label, in clinical practice, in 3 Spanish hospitals

Methods: Observational retrospective study, based on clinical history (CH) revisions of patients with Rheumatoid arthritis (RA), Psoriasic Arthritis (PA), and Espondiloarthiritis (EA) treated with BT.

CH standardization was performed by data collected since 2013 by rheumatologists thought MEDiadd® RHEUMA tool.

Variables: age, gender, indication (RA, PA, EA) TB: Etanercept (ETN), adalimumab (ADA), certolizumab (CRT), golimumab (GOLI), infliximab (IFX), abatacept (ABA), tocilizumab (TCZ), rituximab (RTX). Start and end date from 2002 to 2016

Exclusion criteria: Patients and/or treatment lines with incomplete data (lack data or $n<15$) were also excluded.

Descriptive statistics and Kaplan-Meier survival analysis were performed with r-project.com

Results: From initial 1155 patients, 76 were excluded because of incomplete data. Almost half of the patients (42.35%) were diagnosed with RA, 30.03% have EA and 18.07% PA. 10% were excluded because of other indications. 79.46% of patients with RA are women, as 36.36% of EA and 50.96% of PA; Most of the patients are over 55y. In all indications, the range of 36–54y is the one that present a higher percentage of patients.

For the Kaplan-Meier survival analysis, the complete set of BT that each patient had received was analyze independently, considering 1206 cases. Table 1 shows average time and percentage survival at 1st year

After 1 year, ETN showed the higher rates of survival in RA (98.5%); IFX (100%), and ETN (99%) in PA; and GOLI (100%) followed by ETN (95.8%) in EA. Those BT were used to compare survival curves, finding differences in all cases (α=0.05) except in IFXvsETN in RA; ETNvsIFX in PA; and IFXvs GOLI in EA. Analysis after 5 years showed that the higher survival rates were for IFX in RA (94.4%) and PA (94.7%) and for ETN in EA (89.4%)

Conclusions: BTs with highest survival rates are ETN and IFX for RA and Aps; In EA, GOLI presents a higher rate at 1-year, but at 5-year is overcome by ETN

Standardized information is crucial to assess the global impact of BT. CH analysis reveals clinical practices which describe the effectiveness of treatments in the world, which can help in the decision-making process

THU0762-HPR ONLINE CONSULTATION FOR CHINESE PATIENTS WITH RHEUMATIC DISEASES BASED ON SMART SYSTEM OF DISEASE MANAGEMENT (SSDM) MOBILE TOOLS: A STUDY OF MEDICAL ECONOMICS

F. Xiao[1], Z. Guo[2], Z. Zhang[3], W. Min[4], Y. Tang[5], X. Duan[6], L. Mo[7], H. Wu[8], X. Xu[9], Y. Zhao[10], F. Jiang[11], H. Xiao[1], Y. Zhao[1], Y. Jia[1], F. Zhang[12]. *[1]Medical Department, Shanghai Gothic Internet Technology Co., Ltd., Shanghai; [2]Department of Rheumatology, The First People's Hospital of Huainan City, Huaian; [3]Department of Rheumatology and Immunology, Linyi people's Hospital, Linyi; [4]Department of Rheumatology and Immunology, Heze Municiple Hospital, Heze; [5]Department of Rheumatology and Immunology, Yantai YuHuangDing Hospital, Yantai; [6]Department of Rheumatology and Immunology, The Second Affiliated Hospital of Nanchang University, Nanchang; [7]Department of Rheumatology, The First Affiliated Hospital of Xi'an Jiao Tong University, Xi'an; [8]Department of Rheumatology and Immunology, Dongguan People's Hospital, Dongguan; [9]Department of Rheumatology and Immunology, Changhai Hospital, Shanghai; [10]Department of Rheumatology and Immunology, First Affiliated Hospital of Harbin Medical University, Harbin; [11]Department of Rheumatology and Immunology, Huzhou Third People's Hospital, Huzhou; [12]Department of Rheumatology and Immunology, Peking Union Medical College Hospital, Beijing, China*

Background: China doesn't have efficient primary medical care and referral system. Patients can choose any hospitals or any doctors they like to seek medical care. As a result, most patients with rheumatic diseases rushed to a few large cities. Survey shows that more than 40% of the rheumatic disease patients are unnecessary to go to hospital and they only need advices from specialist. Smart System of Disease Management (SSDM) is a series of applications for chronic diseases management, which develop the interaction between doctors and patients. Our previous study showed that rheumatoid arthritis (RA) patients can master the SSDM and perform self-management after training, including disease activity score with 28 joints (DAS28) and health assessment questionnaire (HAQ) evaluations, as well as medication and lab test data entries.
Objectives: To evaluate the feasibility and benefit of the medical economics of online consultation based on SSDM by rheumatologist.
Methods: The rheumatologists implemented the education and training programs on patients in using SSDM and assist the patients in downloading SSDM mobile application. The SSDM includes doctors' and patients' applications. After data entry, patients can synchronize data to their authorized doctor. On the basis of these data, the rheumatologists can accept the request from their follow-up patients through SSDM and practice consultation in the form of text or telephone call.
Results: From February 2015 to January 2017, 333 rheumatologists supplied 3,119 patients (RA 46%, systemic lupus erythematosus 22%, ankylosing spondylitis 12%, Gout 11%, osteoarthritis 4%, other rheumatic diseases 5%) with 136 times free and 3,556 paid consultations. Paid consulting included 3,537 times text Q&A and 19 telephone consultations. The consulting fee ranged from RMB 10 to 500 yuan (EUR: RMB =1: 7.33) each in average of 121.3±55.19 yuan, which rate match the registration fee in hospital. The total collection of fee for consultations was 399,320 yuan RMB. 35.9% patients receiving online consultation lived in different city with the rheumatologists. If patients seek medical in hospital, in addition to the registration fees and medical expenses, the mean cost of transportation, accommodation, meals and lost wages was 552.68±477.51 (200 - 2,800) yuan. The total of cost for all patients would have been 2, 509,920 yuan RMB, which is 6.29 times compare with the cost of online. Through the SSDM system for online consultations, patients can save 84.09% of the cost. Survey shows all patients were satisfied and 60.28% of them were "very satisfied" with the consultations.
Conclusions: Using SSDM system to obtain online consultation, Chinese patients with rheumatic disease can enjoy reduced cost with high satisfaction. In the era lack of primary care system in China, SSDM may serve a complimentary platform to control medical care cost, as well as relieve the tensions between health care professionals and patients.

THU0763-HPR ADDRESSING THE ELEPHANT IN THE ROOM: A POSSIBLE NEW AND EFFECTIVE WAY TO INCREASE PATIENT ADHERENCE TO MEDICAL ADVICE

G. Grønhaug[1], S. Arnesen[2]. *[1]Department of Public Health and General Practice, Norwegian University of Science and Technology, Trondheim; [2]Department of Comparative Politics, University of Bergen, Bergen, Norway*

Background: Lack of Patient adherence to medical advice (PAMA) are recognized as an era of interest for the last decades [1]. There have been several initiatives to improve PAMA such as patient centred care, shared decision-making, introduction of e-health and m-health. Although they are proven better than usual care, neither of these initiatives is proven successful. Outcome of medical interventions depends on complex psychological and sociocultural factors of which many are uncontrolled by health professionals.
Objectives: In the present study we assess beliefs about priorities in public health care, and adherence to medical advice to establish a novel approach to increase PAMA.
Methods: The Norwegian Citizen Panel (NCP) [2] is an experimental survey. Respondents are randomized to answer similar questions with slightly different wording. NCP is currently about 5000 respondents based on random selection performed by the Norwegian people register. The present study is based on responses to two question experiments from NCP adressing beliefs about priorities in public health care, and adherence to medical advice. The question on priorities in health care is divided in six groups (two control group, four experimental). The question on adherence is divided in three groups (one control group, two experimental). All questions are answered with a seven point Likert scale.

Table 1

Question nr	Question phrases	Result	Confidence Intervall 95%		n=
			Lower bound	Upper bound	
1	Prioritising waiting lists for surgery				
1a	Patients with severe illness are treated first	0,7442	0,7169	0,7714	271
1b	Patients with severe illness are treated first resulting in longer waiting for one in your family	0,7596	0,7329	0,7864	285
1c	Patients with severe illness are treated first, resulting in longer waiting for yourself	0,7600	0,7341	0,7860	266
1d	Those who benefit most from treatment are prioritised	0,5226	0,4877	0,5576	265
1e	Those who benefit most from treatment are prioritised, resulting in longer waiting for one in your family	0,5560	0,5208	0,5912	277
1f	Those who benefit most from treatment are prioritised, resulting in longer waiting for yourself	0,5818	0,5465	0,6171	273
2	Treatment rejection				
2a	Medical doctor denies treatment	0,5009	0,4774	0,5245	539
2b	Medical expertise does not approve the treatment.*	0,5361	0,5117	0,5604	564
2c	Medical expertise and patient organisation agree on not approving the treatment.*	0,5730	0,5478	0,5982	523

Question 1 a-f is used to assess beliefs on health care systems priorities. Question 2 assesses aspects of potential new ways to increase patient adherence.
All questions are answered using a 7 point likert scale. Result is based on positive attitude regarding wording in the question
* Question phrases refer to how the physician explains to the patient why the treatment is rejected.

Conclusions: This study is the first to use experimental survey to assess PAMA. The result indicates that healthcare priorities form a base of trust between health care providers and patients. It further indicates that PAMA might increase if the healthcare provider refers to national expertise and patient organisations beliefs of a given treatment. This finding is supported by psychological theories of meaning-making[3].
Informing the patient about the views of the patient organisations and national expertise in the reasoning for a given treatment, may improve patient adherence to medical advices.

THU0764-HPR WHAT MOVES THE RHEUMATOLOGIST? UNRAVELLING DECISION MAKING IN SSC REFERRAL – A QUALITATIVE STUDY

J.K. Stöcker[1,2], E. Cup[3], R. Nijhuis-van der Sanden[3], B. Staal[2,3], M. Vonk[3], F. van den Hoogen[1,3], E. van den Ende[1]. *[1]Sint Maartenskliniek; [2]Research group Musculoskeletal Rehabilitation, HAN University of Applied Sciences; [3]Radboud university medical center, Nijmegen, Netherlands*

Background: Well-coordinated multidisciplinary non-pharmacological care is considered to be a cornerstone in the management of patients with systemic sclerosis (SSc). However, unmet information and healthcare needs are found to be common in patients with SSc [1]. In addition, referrals by rheumatologists' do not always correspond with potential treatment goals as identified by health professionals (HP)[2].
Objectives: The aim of this study was to gain insight in the perspective of rheumatologists about the referral process of SSc patients to non-pharmacological care and to identify starting points for its optimisation.
Methods: Semi structured in-depth interviews were held with 13 out of 24 rheumatologists, specialised in SSc management, from different Dutch university and regional medical centres. The qualitative data analysis used an inductive thematic analysis by moving through a process of coding in layers of abstraction and interpretation: familiarization with data, generating initial codes, grouping similar codes in categories, discussing categories, searching for themes among categories, reviewing themes, defining and naming themes, and producing the final report.
Results: One major theme was identified as influencing decision making: "beliefs" and its three sub themes: a) beliefs about one's own professional role; b) beliefs about the patients' ability to take an active role in managing the disease and c) beliefs about the added value of non-pharmacological care. We also found an additional theme reflecting the "needs" of the rheumatologists regarding professional multidisciplinary collaboration (Figure 1). Another remarkable finding to be further explored was the discrepancy we found between the reliance of rheumatologists on established routines with regard to when and to whom to refer and the low confidence in HPs competencies on the other hand.

Figure 1. Themes, sub-themes and categories

Conclusions: The results of our study give insight that rheumatologists base their referral decisions on complex reasoning mindlines and beliefs about their own professional role, the patient's role and HP competencies.

THU0765-HPR PATIENT SATISFACTION AND SELF-MONITORING OF CHRONIC INFLAMMATORY ARTHRITIS

K. Grønning[1,2], E.K. Lyngvær[2], A.S. Magnussen[2], E. Rødevand[2]. *[1]Department of Public Health and Nursing, Norwegian University of Science and Technology; [2]Rheumatology, University Hospital in Trondheim, Trondheim, Norway*

Background: Effective drug treatment for patients with inflammatory arthritis have brought a major proportion of patients in clinical remission. The need for regular follow-up intervals in specialized care is less; patients take greater responsibility for their own care, and patients request access to more flexible health care services. As a result of this development, the University Hospital, St.Olavs Hospital, Department of Rheumatology, has developed a on-demand pathway (PORS) for patients with inflammatory arthritis (RA, PsA and AS) in clinical remission or low disease-activity aiming for increased patient responsibility and flexibility.
Objectives: The aim of this study was to investigate patients' satisfaction with PORS regarding disease status, treatment, knowledge, responsibility, and cooperation with health care professionals.
Methods: We conducted a quest-back survey for patients included in PORS for $\geq$1 year in the period from June 2016 to October 2016. The survey contained 10 questions about the pathway. The response alternatives and scoring were: not at all =1, to a small extent =2, to some extent =3, to a large extent =4, to a very large extent =5, and not relevant =0.
Results: We identified 1048 eligible patients, 10 invitations were returned (unknown address), and 312 responded (30%). The descriptive analyses (see table) showed that the patients in general considered their disease activity to be in a stable phase. The cooperation with their general practitioner was good, they had to some or large extent sufficient knowledge to take responsibility for the blood test controls and adhere to prescribed medication. The patients were to some extent satisfied with the renewals of prescriptions and access to health professionals. The patients were less satisfied with the "promise" of getting outpatient appointments within 14 days if needed. Finally, the patients would largely recommend PORS to other patients.

PORS Questions	Mean (SD)	Median	Not relevant
Is the disease activity in a stable phase now?	3.70 (0.95)	4	–
Has the disease activity been in a stable phase since you became included in PORS?	3.62 (0.96)	4	1%
Do you have sufficient knowledge to take responsibility and carry out the routine blood test controls?	4.21 (0.94)	4	1%
Do you have sufficient knowledge and confidence to take your medications as prescribed?	4.26 (0.91)	4	1%
Do the renewals of medications prescriptions work okay?	3.16 (2.1)	4	26,6%
Do you get in touch with the Health Professionals at the Rheumatology Department by phone when you need to?	3.61 (1.6)	4	11,5%
Was the waiting time for an appointment at the department too long before you became included in PORS?	2.50 (1.33)	2	6,7%
Do you get the outpatient appointment within 14 days if you need one?	2.28 (2.06)	2	40,7%
Do you have a good cooperation with your general practitioner?	4.05 (1.07)	4	1,3%
Would you recommend PORS to other patients?	3.91 (1.33)	4	0,3%

Conclusions: We found that patients with inflammatory arthritis in general were satisfied with a management pathway encouraging greater responsibility for managing their own care and the possibility for more flexible contacts with the health care services. However, fullfilling the promise of outpatient appointments within 14 days were not always possible to achieve.
Acknowledgements: We would like to thank the local Rheumatology fund for financing the project.

THU0766-HPR REFERRAL TO TELECARE. A NEW MODEL OF RHEUMATIC PATIENT FOLLOW-UP

L. Cano Garcia, N. Mena-Vazquez, S. Manrique-Arija, F.G. Jiménez-Núñez, I. Ureña-Garnica, C. Domic-Bueno, M. Rojas-Gimenez, C. Fuegos-Varela, M.V. Irigoyen-Oyarzabal, E. Vilchez-Ocaña, A. Fernández-Nebro. *Rheumatology, Hospital Regional Universitario de Málaga, Málaga, Spain*

Objectives: To analyze the medical ramifications that are made to the consultation

of telecare of Rheumatology Nursing (CTCER) of our hospital and health care activity generated by this.
Methods: Design: Observational study cross.
Patients: 301 patients for follow-up were derived to CTCER in a hospital of third level of January - November 2016. Our hospital serves a population of 600,000 people.
Protocol: We have a specific document for referral to CTCER where the rheumatologist specifies the reason for referral, the nurse review period and diagnosis. Nurse appointment the patient in its agenda for the telephone follow-up on the date indicated and recorded in the history of the patient efforts made the day of the appointment. The most common medical efforts making the nurse are preset by consensus with rheumatologists. Coming out than expected are reviewed with responsible for the patient's rheumatologist.
Variables analyzed: diagnosis, reason shunt type of FAME, adverse events, appearance of Comorbidities, nurse management, new problems after telephone consultation.
Statistical analysis: descriptive analysis of the main variables.
Results: Of the 301 patients, 68.4% were women. The diagnoses were: rheumatoid arthritis (RA) 116 (38.5%), spondyloarthropathy (SpA) 34 (11.3%), psoriatic arthritis (PsA) 45 (15%), systemic lupus erythematosus (SLE) (18.9%), vasculitis 1 (0.3%), arthritis juvenile idiopathic (AJI) 5 (1.7%), Still's disease adult 3 (1%), osteoporosis 4 (1.3%), 4 undifferentiated arthritis (1.3%). Them reasons of referral were: control to the month of home of FAME synthetic 120 (39.9%), Control to the home of FAME biological 28 (9.3%), review consultations 110 (36.5%), control toxicity hepatic 17 (5.6%), control alteration hematologic 7 (2.3%), control alteration renal 1 (0.3%), control of security of treatment Mycophenolate 4 (1.3%), control of safety of Teriparatide 6 (2%), wish gestational 1 (0.3%), analytical control not performed in consultation 13 (4.3%) (Table1). The most derived synthetic FAME was methotrexate 174 (57.5%) and the most derived biological FAME was etanercept 16 (5.3%) (table2). Nurse managed bypass autonomously 298 (99%) referrals, need help of the rheumatologist in 2 (0.7%) referrals and having only 1 shunt derived to 2017. 17 (5.6%) leads new problems with the call appeared: intolerance digestive 11 (3.7%), headache 3 (1%), worsening 1 (0.3%), moderate 1 infection (0.3%), poor adhesion 3 (1%), new comorbidity 3 (1%).
Conclusions: The inquiry of telecare is a form of collaborative work rheumatologist-nurse. The nurse can manage leads independently without having to go to your rheumatologist. This type of nurse call brings improvements in patient care, prevents displacement, decreased on-site visits and improves the safety of patients.

THU0767-HPR ADVANCED PRACTICE MUSCULOSKELETAL PHYSIOTHERAPY SERVICES: A NATIONAL EVALUATION

O. Fennelly[1], C. Blake[1], O. Fitzgerald[2,3], R. Breen[2,4], A. Brennan[2,5], J. Ashton[2,6], C. Cunningham[1] on behalf of The National Clinical Programmes for Rheumatology and Orthopaedics. *[1]School of Public Health, Physiotherapy and Sports Science, University College Dublin; [2]National Clinical Programme for Rheumatology, Royal College of Physicians; [3]Department of Rheumatology, St. Vincent's University Hospital; [4]Health Service Executive, HSE; [5]Physiotherapy, AMNCH; [6]Physiotherapy, Beaumont Hospital, Dublin, Ireland*

Background: Patients with musculoskeletal (MSK) disorders may remain on lengthy hospital outpatient waiting lists to be reviewed by a consultant doctor, although medical or surgical intervention may not be required (1,2). In 2012, a waiting list initiative saw the introduction of Advanced Practice Physiotherapists (APPs) across 16 hospitals in Ireland. APPs triage and manage patients awaiting a consultant doctor appointment, who are deemed non-urgent or unlikely to require surgery on screening of referral letters. APP scope of practice generally involves some traditionally medical-controlled acts such as: administering injections, ordering investigations/imaging, surgical listing and onward referral to hospital specialities; and depending on consultant doctor availability, their input may be sought on clinical decisions if required.
Objectives:
- Profile the national APP patient caseload
- Establish the clinical outcomes of APP consultations

Methods: A national database was established with all APPs (n=22) submitting patient data for 2014. These data were analysed using descriptive statistics.

Table 1. Outcomes of APP Consultations

Clinical Outcome	Service Users (n=16,577) n (%)
Physiotherapy*	6,715 (41)
Clinical Investigations	4,833 (29)
Clinical Imaging[a]	1,865 (27)
Orthopaedic/Rheumatology Services[†]	2,818 (18)
Other Hospital Speciality[†]	563 (4)
MSK Injection	685 (4)
Surgical listing	404 (2)

Note: Other clinical outcomes included discharge. Clinical Imaging was added to the database from August to December inclusive. Valid data: [a]n=7,009, *n=16,194, [†]n=15,557.

Results: Data showed that APPs assessed 13,981 new patients, who presented most commonly with MSK disorders of the knee (n=3,096), lumbar spine (n=2,926) and shoulder (n=1,945) (Fig. 1) and the median wait time was 167 days (IQR 91–316). Including an additional 2,596 return appointments, the most common clinical outcomes were physiotherapy and/or clinical investigations (Table 1), and clinical decisions were made independently by the APP in 77% (n=11,728) of recorded cases (n=15,189).

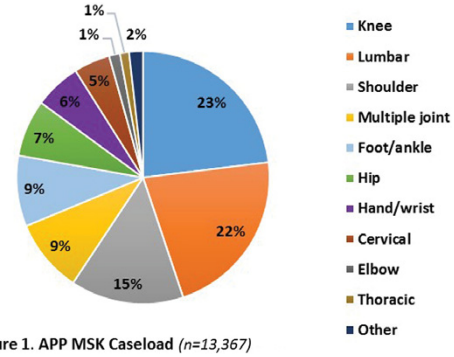

Figure 1. APP MSK Caseload *(n=13,367)*

Conclusions: APP services provide a more efficient MSK clinical pathway and reduce demands on the Consultant Doctor services. Collection of National Data enables ongoing service evaluation and monitoring of key performance indicators.

THU0768-HPR PHONE FOLLOW-UP PROGRAM ENHANCES TREATMENT SAFETY AND DRUG CONCORDANCE ON DISEASE MODIFYING ANTI-RHEUMATIC DRUGS (DMARDS) THERAPY FOR RHEUMATOLOGY PATIENTS

P.F. Lee, Y.S. Cheung, C.K. Lam, M.C. Leung, C.M. Chan, W.L. Ng. *United Christian Hospital, Hospital Authority, Hong Kong, Hong Kong*

Background: DMARDs are beneficial for a number of rheumatic conditions. However, treatment effect may take a few weeks. On the other hand, patients may experience adverse effects (AEs) early on and they may not be able to follow complicated dosage titration regimen. In order to enhance treatment safety and empower self-management, rheumatic disease patients requiring initiation or change of DMARDs were recruited to a rheumatology nurse phone follow-up program.
Objectives: (1) To evaluate the service outcomes of Rheumatology Nurse Phone follow-up Program and (2) explore the factors that may influence treatment adherence
Methods: Upon initiation of DMARDs therapy at out-patient clinic or before hospital discharge, patients and/or their caregivers will be counseled for the new treatment plan and self-management knowledge by rheumatology nurse. A telephone follow-up by rheumatology nurse will be arranged within 4 weeks to monitor patients' condition. Treatment responses, AEs, drug concordance of patients and advice given in each phone consultation (PC) were recorded. Retrospective case review was performed.
Results: There were 1230 episodes of PC performed by rheumatology nurse in 2015. 180 episodes of PC involved 76 patients (56 female) were randomly selected. The average number of PC was 2.4 times per case. The mean age of patient was 58 (24–85) years. Disease categories mainly involved rheumatoid arthritis (60.5%), systemic lupus erythematosus (7.9%), spondyloarthritis (5.3%) and gout (3.9%). The most common DMARDs prescribed were methotrexate (40.8%), hydroxychloroquine (27.6%), sulphasalazine (22.4%) and 39.5% of the study cases have received steroid courses. Among the 76 patients, 8 (10.5%) have taken wrong dosage and another 4 (5.3%) patients have not started therapy due to worries about potential AEs. Altogether 40 patients (52.6%) reported AEs after starting DMARDs. The most common AEs were rash, itchiness, dizziness, alopecia and oral ulcers. For non-adherence behaviour, 8 patients (10.5%) have self-stopped their medication and another 7 patients (9.2%) have self-adjusted the medication respectively. Eventually 90% of the cases were able to continue therapy with or without adjustment of regimes. Only 7 cases (9.2%) required interruption of current treatment or switching to other DMARDs due to AEs within the study period.

Conclusions: Rheumatology nurse phone follow-up program provided a timely and convenient platform to increase patient understanding of disease and treatment, improve their self-efficacy and enhance safety and concordance with DMARDs treatment.

DOI: 10.1136/annrheumdis-2017-eular.4421

THU0769-HPR SCOPE FOR BIOLOGIC PRESCRIBING COST SAVING INITIATIVES WITHIN THE RHEUMATOLOGY DEPARTMENT

R. Heaton[1], J. Nasralla[1], A. Ismail[1], A. Brooks[2], L. Mercer[1], C. Filer[1].
[1]Rheumatology; [2]Pharmacy, Stepping Hill Hospital, Stockport, United Kingdom

Background: The rheumatology department at Stepping Hill Hospital prescribes biologic treatment for 400 inflammatory arthritis patients via external Homecare services. Significant resultant drug waste in the event of drug discontinuation is anticipated.[1] The initiation of a pro-active telephone call at three months, to capture and act upon primary inefficacy and non-tolerance has been considered as a potential alternative method for waste reduction.
Objectives: Establish the baseline level of biologic drug waste (via Homecare) following cessation of biologic treatment. Review whether a proactive phone call (and subsequent limitation of supply if appropriate) prior to the three month review at the start of biologic therapy can help reduce biologic waste. Establish whether there is scope to implement other initiatives to reduce waste in the department.
Methods: Patients who had stopped or switched biologic treatments delivered through Homecare providers were identified using the trust's biologic database and clinic records. Information on biologic delivery quantities and schedule were provided by Homecare companies. Data was analysed used Microsoft Excel®; number (and cost in accordance with pharmacy tariffs) of doses "wasted" was calculated by referring the date of treatment cessation with the date and quantity of last biologics deliveries and patient stock levels as reported by the homecare company. Doses obtained free of charge were excluded. Baseline data was captured over a six month period. Four costs were calculated; (1) Total waste. (2) Wasted supply exceeding two months to assess whether an increase in delivery frequency to two monthly could reduce waste. (3) Waste from unopened deliveries to establish whether waste could be reduced by improved patient education around refusing deliveries in the event of treatment failure or intolerance. (4) Waste from the second biologic prescription issued as a result of stopping biologic at the three month review to assess viability of the proactive phone. A proactive patient phone call was then initiated and waste data captured for a three month period following this intervention.
Results: 27 patients stopped treatment during the 6 months baseline data collection. 23 patients had drug waste totalling £ 32,140.80. The total value of wasted stock exceeding two months supply was £ 5,414.36. Three patients accepted deliveries for further supply and stopped treatment before opening final deliveries, creating a waste total of £ 5,509.09. Four patients stopped treatment at their three month review, £ 4,572.22 of additional biologic was supplied and then wasted as a result. Following the pro-active phone call intervention, 21 patients were contacted before their second supply was due and supply subsequently limited for 8 patients, four of whom stopped treatment at their next consultant review. Limiting supply in the four patients saved £ 6,682.
Conclusions: Initiating a proactive phone call at three months following biologic initiation can reduce drug waste. Other initiatives such as patient education to refuse deliveries and increasing delivery frequency also appear viable waste reduction initiatives.

THU0770-HPR COST SAVINGS BY FAVOURING INFLIXIMAB BIOSIMILARS IN THE EASTERN REGION OF AUSTRIA

B. Reichardt[1], G. Reiter[1], T. Stamm[2], V. Nell-Duxneuner[3].
[1]Behandlungsökonomie, BGKK, Eisenstadt; [2]Section for Outcomes Research, Center for Medical Statistics, Informatics, and Intelligent Systems, Vienna; [3]3Klinikum Peterhof and Ludwig Boltzmann Department for Epidemiology of rheumatic diseases, Nögkk, Baden, Austria

Objectives: Since April 2015, the availability of Infliximab biosimilars offered a new potential for cost savings in limited financial resources of the healthcare system. In Austria, there is currently no open tendering for drugs dispensed at charge of sickness funds and biosimilars take a long time to gain an appreciable market share overall. A contract made between the public hospital operator and the regionale sickness fund of the Eastern Austrian county Burgenland (BGKK) offered a new opportunity regarding the interface problems due to the dually financed (inpatient and outpatient care is separately financed in Austria) health system. Only outpatient care is covered by regional sickness funds.
Methods: With reference to the NOR-SWITCH study (1), confirming the interchangeability of the branded Infiximab and infliximab biosimilar, and the large price advantage of the latter, the BGKK agreed as an exception in the Austrian health system on direct reimbursement of infliximab to the public hospital operator (inpatient care).
The cost savings were calculated based on the monthly invoices of the hospitals. Instead of € 477.19 for 100 mg of branded infliximab, the price for biosimilar infliximab does not exceed € 300.–. The 23 patients on biosimilar were infused with 9,400 mg infliximab overall.
Results: After signing the agreement in December 2016, 23 consecutive patients, representing 82% of all patients on infliximab in Eastern Austrian county Burgenland, switched to or were incident users of an infliximab biosimilar, the 18% have not yet switched due to remaining stocks of branded infliximab or were adolescents where switching is not forced because of lacking data. According to the individual dosing and a price benefit of about 37%, monthly cost savings of about € 16,650.00 could be generated.
Conclusions: Despite availability of cost-effective infliximab biosimilars in Austria, the drugs did not gain significant market share, in contrast to the Scandinavian healthcare systems, $<$4% vs. $>$90% in the first half year of 2016. Further research is needed including clinical data to strengthen the results of this pilot study.

THU0771-HPR INCORPORATING SENIOR PHARMACIST INPUT IN TERIPARATIDE PATHWAY ENSURES ADHERENCE TO PRESCRIBING GUIDANCE - AUDIT/QUALITY IMPROVEMENT RESULTS FROM A DISTRICT RHEUMATOLOGY UNIT

W. Gan, L. Bromilow, S. Vasireddy. *Bolton NHS Foundation Trust, Bolton, UK*

Background: Teriparatide is licensed for upto two years to treat severe osteoporosis. It is the most expensive osteoporosis treatment available (around £ 3500 per year). Hence a locally adapted national NICE guidance is used for prescribing in our department, but the previous level adherence was uncertain. In 2011, a directory of services was agreed for our metabolic bone clinic. At the time a Rheumatology senior pharmacist review with the prescribing senior clinician was agreed on our teriparatide treatment pathway, including pre-treatment DXA, and a specified bone profile screen before treatment and for repeat prescribing at specified intervals. The agreement also incorporated access for our patients to senior pharmacist advice if needed via the department's secreterial team.
Objectives: Our objective was to assess the impact of the senior pharmacist input on our adherence to the agreed guidelines in our Teriparatide pathway, including assessing treatment completion and response.
Methods: Patients with osteoporosis who were started on Teriparatide between 2011–2015 were identified from pharmacy prescribing spreadsheets. A retrospective review of case notes of all patients were carried out. Data including age, gender, prior agents tried, pre-treatment bone profile, pre and post treatment DXA, and treatment completion were collected on a Microsoft Excel 2010 spreadsheet for processing and descriptive statistics.
Results: 33 patients who were started on teriparatide treatment between 2011–2015 were identified (29 female and 4 male). Mean age was 76.2 (range 63–92). All had pre-treatment DXA, and 32 (97%) were compliant with recommendations for initiation of teriparatide treatment with respect to DXA (one patient borderline). All 33 patients had a pre-treatment bone profile within acceptable limits before start of treatment (adjusted Calcium, Serum Parathyroid Hormone, Vitamin D level, e-gfr). 28 (84.8%) patients tried one agent before initiation of Teriparatide treatment and 5 (15.2%) patients tried 2 agents. 24 (72.7%) patients completed the full course of recommended treatment. 11 out of 24 patients who completed Teriparatide treatment have had post-treatment DXA. 3 out of 24 patients who completed Teriparatide treatment had a fragility fracture after treatment.
Conclusions: This audit confirms the benefit of incorporating Rheumatology senior pharmacist review in the pathway from the excellent compliance with guidelines in initiating and managing Teriparatide noted in the results. This is likely to have also contributed to the high completion rate of the treatment course. However, only 11 out of 24 had post treatment DXA, and this needs improvement by the next audit cycle, through input of senior clinicians who are in charge of requesting DXA. We would, therefore, recommend incorporating senior pharmacist input for review in teriparatide treatment pathways routinely.

THU0772-HPR VARIATION IN RHEUMATOLOGY NURSING CARE IN THE NETHERLANDS: A SURVEY AMONG NURSES

Y. Van Eijk-Hustings on behalf of Working Group Rheumatology Nursing Research. *Clinical epidemiology and medical technology assessment/Patient & Care, Maastricht University Medical Centre, Maastricht, Netherlands*

Background: EULAR recommendations for the role of nurse aim at guaranteeing a certain standard of care for people with rheumatic musculoskeletal diseases

(RMDs) and at optimising the use of nursing competencies [1]. In the Netherlands, these recommendations seem well implemented. There are specialised nurses (SNs); nurses trained at a secondary vocational or Bachelor level, followed by a one-year educational program in rheumatology, and nurse practitioners (NPs), trained on a Master Level. SNs provide information, education and (psychosocial) support, but also monitoring of disease, supervised by a rheumatologist. NPs are trained and legally authorised to provide integral medical (e.g. prescribing) and nursing care independently. Informal discussions among rheumatology nurses suggest a variation in roles, and tasks of SNs and NPs, and of care organisation in rheumatology practices.

Objectives: The objective of this study was to explore current roles and tasks of SNs and NPs, and care organisation in order to visualise potential variation.

Methods: A web-based questionnaire, based on literature [2] and existing task descriptions was disseminated among all members of the Dutch Nurses Association, unit Rheumatology (n=257). The questions were in closed-ended, multiple choice, likert-scales and open-ended format as appropriate. Data were analysed descriptively. Subgroup analyses were carried out for SNs and NPs.

Results: In total 84 nurses, 75 SNs and 9 NPs responded. Characteristics, roles and main tasks are presented in Table 1.The majority of the SNs, 96.4%, and 100% of the NPs work at the outpatient clinic, providing individual face-to-face consultations or telephone support.

Table 1

	SN (n=75)	NP (n=9)
Age, mean years (sd)	47.6 (9.5)	46.7 (10.2)
Female (%)	98.7	88.9
Appointed, mean hours/week (sd)	24.8 (6.0)	33.1 (4.1)
Days/week, median (IQR)	3 (3.4)	4 (4,4)
Role (%)		
SN	85.3	33.3
NP	0	55.6
Other (e.g.combination with research or infusion)	14.7	11.1
Tasks (% always/often)		
Information and education about disease	89.3	100
Information and education about treatment	90.7	88.9
Metrology	78.7	100
Joint examinations 57.3	100	
Make diagnosis new patients	1.3	22.2
Manage patients with RMDs	54.6	88.9
Administrate medication	45.4	22.2
Give intra-articular injections	1.3	22.2
Independent prescribing	2.7	77.8
Screen for comorbidities	29.3	44.4
Manage patients on biologic therapy	54.7	100
Provide psychosocial support	82.7	77.8
Refer to other health professionals	58.7	77.8
Monitor patients on DMARD	70.7	88.9
Self-management support	77.3	33.3
Time for consultations, median (IQR) minutes		
New patient (diagnosing)	27.5 (0,30)	42.5 (32.5, 45)
Newly diagnosed patients	45 (30,60)	30 (17.5, 60)
Follow-up patients	30 (20,30)	17.5 (15, 20)

Conclusions: Differences in roles, tasks and available time for consultations visualise variation in care organisation and in the content of rheumatology nursing care, also within the SN and NP group respectively. Further research on these differences is necessary but they show inequity of care for people with RMDs in the Netherlands and also suggests suboptimal use of nursing competencies.

HPR measuring health (development and measurement properties of PROs, tests, devices) —

FRI0732-HPR THE PSS-QOL: DEVELOPMENT AND FIRST PSYCHOMETRIC TESTING OF A NEW PATIENT-REPORTED OUTCOME MEASURE FOR PSS PATIENTS

A. Lackner[1], J. Hermann[1], J. Unger[2], T. Stamm[3], M. Stradner[1], W. Graninger[1], C. Dejaco[1]. *[1]Dept. of Rheumatology & Immunology, Medical University of Graz, Graz; [2]Dept. of Health Studies, University of Applied Sciences, Bad Gleichenberg; [3]Institute of Outcomes Research, Medical University Vienna, Vienna, Austria*

Background: Patients with primary Sjögren Syndrome (PSS) are affected by glandular and extraglandular manifestations leading to physical and psychological impairment. To what extent these factors affect the health related quality of life (HRQL) of these patients is largely unexplored. Disease activity scores for PSS have been developed but there is no disease-specific HRQL questionnaire available so far.

Objectives: To develop a questionnaire for the assessment of HRQL in PSS.

Methods: In a previous qualitative study, concepts related to HRQL in PSS were identified by focus-group interviews with PSS patients. Based on these concepts, a questionnaire (PSS-QoL) was developed focusing on two main topics: physical (pain and dryness) and psychosocial dimension. The first draft of this questionnaire was evaluated by semi-structured interviews with PSS patients (n=6) and rheumatologists (n=4). Based on their feedback, a revised questionnaire was constructed and re-evaluated by the patients and physicians. Subsequently, psychometric testing of PSS-QoL was performed in 75 PSS patients of the outpatient clinic of the Medical University Graz. For testing of internal consistency Crohnbach's α was used. Convergent construct validity was tested by correlating the scores with the ESSPRI and the EQ-5D. Reliability was examined by asking patients who considered themselves to be in a stable disease to complete the questionnaire 1–2 weeks apart. In addition, an English version of PSS-QoL was was developed using a standard methodology for translation.

Results: Out of the 75 PSS patients, 91% were female, disease duration was 4.8±4.08 years and age of patients was 58.5±12.5 years.The internal consistency of the PSS-QoL showed a Crohnbach's α of 0.892 and we found a moderate correlation of the PSS-QoL with the ESSPRI ($Corr_{coeff}$=0.625) and the EQ-5D (EQ5D-pain/discomfort; $corr_{coeff}$=0.531). A second assessment was performed after 1–2 weeks in 21 patients with stable disease. The ICC for PSS-QoL was 0.958 (95% CI 0.926 to 0.981). In comparison, the ICC for EQ-5D in this population was 0.854 (95% CI 0.735 to 0.933). Subsequently, the final German version of PSS-QoL was translated forward and back into English by native speakers.

Conclusions: A questionnaire to assess the HRQL in PSS patients has been developed and tested for its psychometric properties. The PSS-QoL should allow for a better and more comprehensive assessment on patients' HRQL in PSS. Multicentre studies for further validation are needed.

FRI0733-HPR THE EDUCATIONAL NEEDS OF PATIENTS WITH UNDIFFERENTIATED SPONDYLOARTHRITIS

A. Bremander[1,2,3], E. Haglund[2,3], S. Bergman[1,3,4], M. Ndosi[5]. *[1]Department of Clinical Sciences, Section of Rheumatology, Lund; [2]School of Business, Engineering and Science; [3]Spenshult Research and Development Center, Halmstad; [4]Institute of Medicine, The Sahlgrenska Academy, University of Gothenburg, Primary Health Care Unit, Department of Public Health and Companionship Medicine, Gothenburg, Sweden; [5]Department of Nursing and Midwifery, University of the West of England, Faculty of Health and Applied Sciences, Bristol, United Kingdom*

Background: The educational needs of people with undifferentiated spondyloarthritis (USpA) have not been well studied. The educational needs assessment tool (ENAT) has been translated into Swedish and validated in other rheumatic diseases but not USpA.[1]

Objectives: To validate the educational needs assessment tool (ENAT) in people with USpA and use it to study their educational needs.

Methods: A cross-sectional study recruiting a random sample of patients with USpA from a hospital register. USpA was diagnosed according to the International Classification of Disease, ICD-10 (M46.0, M46.1, M46.8, and M46.9).[1] The study was approved by the Regional Ethics Board and all included patients signed an informed consent. We used a postal survey to collect data on disease activity (BASDAI) and educational needs (Swedish version of the ENAT).[2] The data was then utilized to assess the construct validity, internal consistency, unidimensionality and response bias of the ENAT using Rash analysis. Given fit to the Rasch model, we transformed the ENAT ordinal scores into interval logit-based scores before deploying descriptive and inferential statistics. Total ENAT Score ranges between 0 (no needs) and 156 (the highest level of needs), and comprises seven subscales (pain 0–24, movement 0–20, feelings 0–16, disease 0–28, treatments 0–28, self-help 0–24 and support 0–16). Finally, we categorised the data by gender, age (median split) and disease activity (BASDAI split at 4) and assessed differences between patient subgroups using the student's t-test.

Results: Complete responses were derived from 77 patients (48 women), mean (SD) age 50 (12) years, disease duration was 16 (11) years, BASDAI 4.9 (1.9) and BASFI 3.1 (2.3). When used as a 7-subscale questionnaire, the ENAT satisfied the requirements of Rasch model (c^2=11.488; p=0.119) including strict unidimensionality.

Overall, the mean (SD) ENAT scores for patients with USpA was 86 (32). Women reported higher needs than men in the domains of pain, mean (SD) 13.1 (6.8) vs. 10.1 (6.0), p=0.05; movement mean (SD) 13.0 (5.5) vs. 9.9 (5.7), p=0.02 and self-help, mean (SD) 17.0 (5.8) vs. 14.1 (5.0), p=0.03). Higher disease activity (BASDAI >4) was associated with higher educational needs, mean (SD) 92.6 (31.9) vs. 73.7 (29.4), p=0.02. There was no significant difference in educational needs between age groups.

Conclusions: The Swedish ENAT has been validated in USpA thus enabling an accurate estimation of the educational needs of people with USpA in Sweden.

Our data suggest that women and patients with higher disease activity are likely to have high levels of educational needs and these groups should be targeted in educational interventions for people with USpA.

FRI0734-HPR EFFECTS OF VIRTUAL REHABILITATION ON SHOULDER PERIARTHRITIS

B. Kapşigay[1], Z. Sari[1], B. Kavlak[1], I. Aras[2], A. Tanhan[1]. *[1]Physiotherapy and Rehabilitation, Marmara University Health Science Institute; [2]Physiotherapy and Rehabilitation, Special Kızılay Medical Center, Istanbul, Turkey*

Background: The virtual rehabilitation (Nintendo Wii) program works with a 3-dimensional, computer-assisted, virtual reality creation system.The system creates a mirror effect and provides the smoothness of the movement of the adult. It keeps visual and sensory feedback during exercise.The avatar that appears on the screen detects motion and displays the result thanks to the control commander. The use of virtual reality practice in the exercise program is a new way of improving participation and motivation of participants.
Objectives: The aim our study is to investigate the effect of virtual rehabilitation on kinesophobia and clinical fragility in patients with shoulder periathritis.
Methods: Fifteen cases diagnosed with shoulder periarthritis were included in the study. In our study, we used Tampa Kinesophobia Scale for kinesophobia, VAS for pain severity, manual muscle test for muscle strength and goniometer for ROM. In addition to Clinical fragility Scale for fragility and 4-item Quality of Life Questionnaire were used to assess quality of life. Finally, Shoulder Pain and Disability Index (SPADI) was used for shoulder disability. Eight of 15 patients were included in the control group (CG) and 7 in the virtual rehabilitation group (VRG). Both groups were treated with Therapeutic US, TENS and Cold Pack. In addition to these, the control group consisted of 15 sessions of active stretching and strengthening exercises for 20 minutes each session; the VRG was given a total of 15 sessions of the virtual rehabilitation program for 45 minutes each session, with 3 sessions per week. Intra-group pretreatment and post-treatment differences were analyzed by Wilcoxon test, and inter-group comparisons were analyzed by Mann-Whitney U test.
Results: Statistically significant reductions in Frajilite, Kinesophobia, SPADI and VAS values were observed in the VRG analyzes; A statistically significant increase in the 4-item quality of life questionnaire, range of motion and muscle strength values was assessed ($p<0.05$). In the CG, there was a statistically significant decrease in kinesophobia, VAS and SPADI values; There was a statistically significant increase in joint range of motion and muscle strength evaluations ($p<0,05$). There was no statistically significant difference in the fragility evaluation of the CG ($p>0,05$).
Fragility and kinesophobia decreased in both groups after treatment compared to before treatment, but this decrease was found to be higher in VRG ($p<0.05$).
Conclusions: As a result of our study, virtual rehabilitation in the treatment of kinesophobia and fragility in shoulder periarthritis patients was game-focused and it was found to be an effective method for increasing participation and biofeedback. Virtual rehabilitation was considered as an alternative to conventional physiotherapy and rehabilitation programs.

FRI0735-HPR ANALYSIS OF LEFT VENTRICULAR FUNCTION WITH ECHOCARDIOGRAM IN PATIENTS WITH PSORIATIC ARTHRITIS AND NOT DIAGNOSED CARDIOVASCULAR DISEASE

P. Egea-Serrano[1], A.C. Haro-Martínez[2], A. Vidal[1], D. Palma-Sánchez[2]. *[1]Cardiology; [2]Rheumatology, Hospital Rafael Mendez, Lorca, Spain*

Background: It is known that some rheumatologic disorders may affect the cardiovascular system. In the last years, psoriatic arthritis (PsA) has been pointed out as one of those.
Objectives: The aim of this study was to analyze if there was any subclinical dysfunction sign in patients with PsA of whom no cardiovascular disease had been diagnosed.
Methods: Forty three patients with PsA were studied. A comprehensive echocardiogram was performed. Variables recorded for each patient were: left ventricular (LV) dimensions, LV and right ventricular (RV) systolic function, valve morphology and function, LV diastolic function assessment, and longitudinal strain (LS) assessment with speckle tracking imaging. Information on age, sex, cardiovascular risk factors (hypertension, diabetes, dyslipemia, renal disease and smoking), and evolution time of PsA was also recorded. An electrocardiogram was also carried out for each patient.
Results: There were 23 men and 20 women. The mean age was 52±12 years old. The PsA mean evolution time was 6.8±5.3 years. Most of patients had at least one cardiovascular risk factor. All patients were in synusal rhythm. The LV end-diastolic diameter and ejection fraction, left atrium, and RV function were within normal limits. Men had overall a thicker interventricular septum (12±1.7 mm) when compared to women (9.7±1.6mm). 86% patients had a normal mitral valve function, as so 91% with aortic valve. None of them had findings suggesting pulmonary hypertension, or pericardial effusion. The diastolic function assessment in the general population revealed normal average of septal and lateral A' and S waves peak velocities, and E/E' ratio. Men had lower septal E' and S waves values and higher septal A' wave velocity. Nearly 50% of patients had a low septal E' or lateral E' wave peak velocity. 13 patients (30%) had impaired both septal E' and lateral E' waves, who were older and mainly men. The strain analysis showed an average of global LS - 17.9%±3%, two-chambers general LS -17.2%±5%, three-chambers general LS -19%±5.2%, and four-chambers general LS -17.3%±3.5%; without any significant difference between sex. 26 patients (60.5%) had global LS above normal limits; these were younger and with less PsA evolution time. Longitudinal strain values tended to be less negative at the basal level.
Conclusions: Half of the patients with PsA were found to have some feature of diastolic dysfunction and more than the half of them had a slightly impaired global longitudinal strain value. Further studies could be of value to determine whether these findings would have a specific impact on the follow-up in this kind of patients.

FRI0736-HPR VALIDITY AND RELIABILITY OF PERFORMANCE TESTS ASSESSING BALANCE AND FALL RISK IN PATIENTS WITH TOTAL KNEE ARTHROPLASTY

D.C. Sarac[1], B. Unver[2], S. Cekmece[2], V. Karatosun[3]. *[1]Division of Physiotherapy and Rehabilitation, Faculty of Health Sciences, Izmir Katip Celebi University; [2]School of Physiotherapy and Rehabilitation; [3]School of Medicine, Department of Orthopaedics, Dokuz Eylul University, Izmir, Turkey*

Background: Total knee arthroplasty (TKA) is a common surgical intervention that is performed with an aim to treat severe osteoarthritis (OA) of knee. Even though there is a rapid improvement in knee pain, functional improvement is limited in the following year after the surgery. Increased fall risk due to impairments in balance is one of the most common limitations after TKA. Therefore, balance and fall risk evaluation is an essential part of the assessment.
Objectives: The aim of this study was to determine the validity and reliability of various performance tests that are used for evaluating balance and fall risk in patients with TKA.
Methods: This study included 32 OA patients (27 F, 5 M) who undergone TKA surgery 6 months prior to the study. Mean age and BMI of the patients were 64±10,58 and 30,49±5,87, respectively. Participants performed the Timed Up and Go Test (TUG), 10 Meter Walk Test (10MWT), Single Leg Stance Test (SLST), Functional Reach Test (FRT), 2 Minute Walk Test (2MWT), Five Times Sit to Stand Test (5x SST) as performance tests. Each of the tests was performed twice, with a

Table 1. Test-Retest Reliability analysis of the performance tests

	Day 1 Mean (SD)	Day 2 Mean (SD)	ICC (95% CI)	SEM	MDC_{95}

1-day interval. ICC models were used to determine the test-retest reliability. Berg Balace Scale (BBS) was used as the reference standard to establish concurrent validity.

Results: All tests showed good to excellent reliability (ICC >0.94) except SLST which showed moderate to good reliability (ICC=0.74). Three of the tests (SLST, 10 MWT, 5x SST) found to have good to excellent validity (r>0.75) and three (2 MWT, TUG, FRT) found to have moderate to good reliability (r>0.69). Results are presented in details at Table 1 and Table 2.

Conclusions: TUG, 10MWT, SLST, FRT, 5x SST and 2 MWT are reliable and valid outcome measures, and could be used to assess balance and fall risk in patients with TKA. MDC scores presented in this study can be used to evaluate change in performance over time or effectiveness of interventions. 2 MWT and 5x SST were determined as the most reliable and valid methods among the investigated tests.

FRI0737-HPR THE SOURCES OF PAIN IN ABDOMEN IN PATIENTS WITH RHEUMATOID ARTHRITIS

H. Palhuyeva[1], A. Litviakov[1], V. Shynkovski[2], N. Podolinskay[2]. *[1]Internal diseases; [2]Vitebsk State Order of Peoples' Friendship Medical Universityon, Vitebsk, Belarus*

Background: Systemic diseases of connective tissue associated with the early development of atherosclerosis [1,2]. It is well-known that the main cause of decrease the quality of life patients with rheumatoid arthritis (RA) is a chronic pain syndrome. The cause of pain can be joint inflammatory process, systemic manifestations of RA (vasculitis, pericarditis, pleurisy, polyneuropathy), complications of drug therapy, comorbid conditions. Pain in the stomach area may be associated with NSAID-gastropathy, problems with spinal discs, and perhaps with atherosclerotic lesions of the abdominal aorta.

Objectives: To estimate atherosclerotic changes of arteries in patients with RA and determine possible sources of pain in the abdomen by ultrasound-control palpation.

Methods: We included 75 patients with RA (age 38,7±7,4, males 93,3%) and 29 healthy subjects, matched for age and gender, without a history of cardiovascular diseases. An ultrasound investigation of the arterial vassal with measurement of the intima-media thickness (IMT) of carotids was performed. To determine the source of pain in the abdominal cavity ultrasound-control palpation of duodenal bulb, gallbladder, lumbar discs, and abdominal aorta was done. Severity of pain was assessed using the VAS.

Results: It has been determined, that in RA group IMT was 0.8 mm (0.7–0.9), compared with 0,6 mm (0,6–0,7) in control group. IMT positively correlate with the age, duration of disease, Ritchie index, C-reactive protein level. In 22 (29,3%) patients with RA we found atherosclerotic plaques lesion in carotids, aorta, and vessels of the lower extremities. Present of atherosclerotic plaques associated with disease durations (12 years (10–15) in group with plaques and 5 years (3–8) in group without plaques). The presence of atherosclerotic plaques is associated with rheumatoid factor (c^2=1,02, p>0,05), and systemic manifestations of RA (c^2=15,89, p<0,001).

In RA group 36 (48%) patients had indicated the presence of pain in the abdomen while performing ultrasound control palpation. In 15 (20%) cases was detected pain during palpation of the lumbar spine, VAS 48 (36–59). In 21 (28%) cases, patients indicated pain during palpation of the abdominal aorta, VAS 42 (31–65). In this group of patients we found signs of the atherosclerotic lesions of aorta: change in the contour of the vessel, the heterogeneous structure of the vascular wall. Atherosclerotic plaques in the abdominal aorta are founded in 21 (28%) cases.

Conclusions: Patients with RA had an increase thickness of IMT and atherosclerotic plaques, which appear in various vascular regions. During performing ultrasound-control palpation in 36 (48%) patients was detected pain, associated with vertebral changes 15 (20%), and with atherosclerotic changes of abdominal aorta – 21 (28%).

FRI0738-HPR QUALITY IN REHABILITATION FOR RHEUMATIC AND MUSCULOSKELETAL DISEASES (RMDS): DEVELOPMENT AND TESTING OF A RMD REHABILITATION QUALITY INDICATOR SET

I. Johansen[1], M. Klokkerud[1], T. Glott[2], M. Larsen[3], K. Lande[4], K.B. Hagen[1], I. Kjeken[1]. *[1]National Advisory Unit on Rehabilitation in Rheumatology, Diakonhjemmet Hospital; [2]Sunnaas Hospital; [3]National Rheumatism Association, Oslo; [4]Haugesund Rheumatism Hospital, Haugesund, Norway*

Background: Rehabilitation in Norway is characterized by a lack of coordination across levels of care, and by large variations in content and quality. A means to monitor the quality of care is to use quality indicators (QI), which are related to structure (the settings in which care is given), process (what is actually being done) or outcome of health care.

Objectives: To develop and test a set of quality indicators for rehabilitation of people with RMDs.

Methods: The QI set was developed following the Rand/UCLA Method and pilot-tested for validity and feasibility in 29 specialist and primary care rehabilitation units. Pass rates were recorded in telephone interviews with managers of the rehabilitation units (structure QIs (yes/no)), or patients (process and outcome QIs (yes/no)). Time use and participants rating of face validity on a numeric rating scale (0–10, 10=high validity) were recorded. Separate QI pass rates and summary QI pass rates were calculated.

Results: A total of 164 patients (mean (SD) age 58.5 (16.5) years and 76% women) participated. Mean (range) validity score for managers/patients was 8.3 (8)/7.9 (9), and mean answering time was 6.0/5.5 minutes.

A 100% summary pass rate was reached by only two of the rehabilitation units and 4% of the patients.

Conclusions: To our knowledge this is the first QI set developed to measure QI pass rates for rehabilitation of RMDs. The results indicate that the QI set is acceptable to respondents, and it's validity and feasible format make it suitable for monitoring quality of rehabilitation. The large variety in pass rates suggests a high potential for quality improvement in rehabilitation.

Goal attainment at discharge	41	Reached important goals	89
Goal attainment 3–6 months after discharge	21		
Function at admission and discharge e	79	Had important improvement in physical, psychological or social function	86
Function 3–6 months after discharge	24		
HRQoL at admission and discharge	29	Had improvement in quality of life	77
HRQoL 3–6 months after discharge	17		
Registration of adverse events	96	Experienced negative events	12

*External HPs are health professionals from other health care settings, such as primary care.

We thought to measure the value for patients we should let them participate in the project and asked them about what is of value for them and what are there goals. A good reason to start with a patient panel.
Objectives: For this reason we aimed to create a patient panel of rheumatology patients that are well informed and prepared to actively cooperate and participate in research, and co-design novel healthcare strategies.
Methods: Staff members (e.g. doctors and nurses) were asked to nominate patients that are expected to actively participate in the panel. Nominated patients were verbally approached and asked to participate. After mutual agreement a contract was signed were patients discretion was warranted, the capacity to handle confidential information was assessed and equality between members of the panel and staff was ensured. Enlargement of the panel is primarily staff-driven, but panel members are also invited to actively recruit other rheumatology patients.
Results: The initial enrolment period lasted for six months. Thereafter, meetings were organized were discussion were held on various themes such as goals and value for rheumatology patients. Additionally, a focus group of rheumatoid arthritis (RA) patients was assembled to evaluate a PROMs measurement tool. To date, a number of four panel discussion have been held. Currently, our patient panel consists of 54 patients with all kinds of rheumatic diseases. Their demographic and clinical data are presented in Table 1.

Table 1

	Value
Patients (n)	54
Gender (%male)	17
Age (yrs)	51 (20–77)
Disease duration (yrs)	9 (0–30)
Diagnosis (%)	
– Rheumatoid Artrithis	54
– Arthrosis	15
– Fibromyalgia	10
– SpA (including APs and SA)	12
– Other	9

Our panel has been asked to participate in other (hospital-wide) programmes including the development and evaluation of a patient portal. We organize about three meetings for the whole panel every year and arrange focus group meetings to discuss specific subjects.
Conclusions: Panel members are very open and enthusiastic. Some quotes: "I'm happy to do something in return for the good care I receive.", and "I want to promote participation in scientific research". Deployment of patient participation for co-creating innovations alongside research is an asset these days to connect changes to patients perception.
In real live involving patient as an expert is not an effortless action for both patients and the expert care takers, it leads to satisfaction and an effective treatment.

FRI0740-HPR ONLINE REMOTE MONITORING OF PATIENTS WITH RHEUMATOID ARTHRITIS: FIRST RESULTS OF A PILOT STUDY

L. Renskers[1], S.A.A. Rongen[1,2], S. Teerenstra[3], M.E.J.L. Hulscher[1], P.L.C.M. van Riel[1,2]. *[1]IQ Healthcare, Radboud Institute for Health Sciences, Radboud university medical center, Nijmegen; [2]Rheumatology, Bernhoven, Uden; [3]Department for Health Evidence, Radboud Institute for Health Sciences, Radboud university medical center, Nijmegen, Netherlands*

Background: Since the disease activity of patients with RA tends to fluctuate between visits and disease flares are easily missed during regular visits, patients might benefit from a more closely spaced determination of disease activity, which could be realised by iMonitor[1]. iMonitor is a Software Medical Device developed and funded by Pfizer. This online system allows patients to complete three kinds of patient-reported outcome measures (PROMs): the Health Assessment Questionnaire (HAQ), Rheumatoid Arthritis Impact of Disease (RAID) and Rheumatoid Arthritis Disease Activity Index-5 (RADAI-5). iMonitor might contribute to identification of patients who need additional medical attention in between visits and reduction of visits for patients with stable disease activity.
Objectives: To determine the degree to which the PROM-scores in iMonitor are associated with DAS28. Moreover, PROM preferences and completion rates were studied.
Methods: Patients were recruited at Bernhoven (Uden, the Netherlands) by an announcement on the hospital website, leaflets and meetings. Instruction classes were organised in which researchers assisted patients in using iMonitor. Patients indicated which PROM(s) they want to complete in iMonitor and chose reminder email frequency (weekly, two-, four, six, or eight-weekly). Descriptive analyses were used to describe characteristics of the study population. Scatter plots with regression equations were performed with DAS28 as dependent and PROM as independent variable to determine the association between DAS28 and PROMs. Moreover, Pearson's correlations were calculated. PROM-scores within the fourteen day window before and after DAS28 assessment were included.
Results: In total 33 patients with RA were included, seventeen of them were female (52%). Mean (±SD) age was 56±11 years. Seventeen patients (52%) attended the instruction classes. Majority of patients (n=10) chose all three PROMs to complete, nine patients chose RAID+RADAI-5, seven chose HAQ+RAID, three chose RAID, two chose RADAI-5 and two chose HAQ+RADAI-5. From March 2016 until December 2016, 435 RAID-values, 329 RADAI-5-values and 222 HAQ-values were gathered. When taking PROM-values within the fourteen day window before and after DAS28 assessment, 159 DAS28-values could be coupled to 320 PROM-values. Regression analysis showed the following proportions of explained variance (R^2): 0.17 for HAQ, 0.32 for RAID and 0.29 for RADAI-5. Pearson's correlation coefficients were 0.41 for HAQ, 0.57 for RAID and 0.54 for RADAI-5. Most chosen reminder email frequency was four weeks (n=21). Completion rates (measured until December 31, 2016) were 65% for patients with one week PROM-frequency and for patients with two, four, six and eight week frequency completion rates were 39%, 24%, 30% and 0%, respectively.
Conclusions: RAID and RADAI-5 were moderately associated with DAS28 and showed highest proportions of explained variance. The association between HAQ and DAS28 was weaker. Patients receiving a weekly reminder email showed highest completion rates. This pilot study is a first step towards personalised healthcare and patient involvement in online remote monitoring.

FRI0741-HPR SCREENING FOR DEPRESSION AND ANXIETY IN AN OUTPATIENT RHEUMATOLOGY CLINIC USING VALIDATED SELF-APPLIED QUESTIONNAIRES

L.F. Perez, A. Martinez, M. Moreno, L. Silveira. *Reumatologia, Instituto Nacional de Cardiologia Ignacio Chavez, Mexico City, Mexico*

Background: Anxiety and depression are often present in chronic rheumatic diseases. Recognition of these psychological disorders is fundamental for proper patient management. The absence of screening leaves more than >50% of patients with depression unidentified. Patient Help Questionnaire-9 (PHQ-9) and General Anxiety Disorder-7 (GAD-7) are two validated self-applied questionnaires that are appropriate to assess the presence of, depression and anxiety, respectively.
Objectives: 1) To assess the prevalence of depression and anxiety in a hospital based outpatient Rheumatology clinic and 2) To provide the attending physician with appropriate instruments that allow a rapid orientation on the psychological status of her/his patient.
Methods: Consecutive patients that attended our outpatient Rheumatology clinic from March to June 2016 were invited to participate in this crosssectional study. Participants filled out PHQ-9 and GAD-7 in the waiting room. The prevalence and severity of anxiety and depression were calculated for the most prevalent diagnoses.
Results: A total of 410 patients were recruited; 339 (82.8%) were female. Overall, 191 (46.6%) patients reported depressive symptoms (PHQ-9>5). Of them, 87 (21.2%) were classified as having moderate depression or higher (PHQ-9 >10). Prevalence of depression and anxiety among study participants according to each rheumatic disease is depicted in Table 1. Prevalence of moderate or severe depression was significantly different among various rheumatic diseases (p=0.001). Regarding anxiety symptoms, they were reported in 168 (40.7%); 67 (16.2%) of them had moderate or severe anxiety.

Disease	N	Moderate or severe depression	Moderate or severe anxiety
SLE	99 (24.1 %)	16 (16.2 %)	12 (12.1 %)
RA	107 (26.1 %)	26 (24.3%)	17 (15.9%)
FM	87 (21.3 %)	**30 (34.5 %) p= 0.001**	**27 (31 %) p=0.001**
OA	69 (16.8 %)	**25 (36.2 %) p= 0.001**	**22 (31.9 %) p=0.001**
SSc	18 (4.4 %)	13 (26 %)	8 (16 %)
Inflammatory myopathies	14 (3.4 %)	4 (28.6 %)	2 (14.3 %)
Osteoporosis	49 (12 %)	14 (28.6 %)	9 (18.4 %)
APS	42 (10.2 %)	**1 (2.4 %) p= 0.001**	3 (7.1 %)

Table 1. Prevalence of depression and anxiety among study participants according to each rheumatic disease. (SLE – Systemic lupus erythematosus, RA – Rheumatoid Arthritis, FM – Fibromyalgia, OA – Osteoarthritis, SSc – Systemic sclerosis, APS – Antiphospholipid syndrome.

Conclusions: This cross-sectional study shows that anxiety and depression are frequent in the Rheumatology clinic. We demonstrated that the use of a self-applied screening tool can help clinicians to properly detect depression and anxiety associated with diverse rheumatic diseases. Specia attention should be paid to patients with fibromyalgia and osteoarthritis.

FRI0742-HPR DOES THE USE OF TECHNOLOGICAL DEVICES IMPROVE THE RELIABILITY OF MEASURING THE ACTIVE CERVICAL RANGE OF MOTION IN PATIENTS WITH NECK PAIN? A SYSTEMATIC REVIEW WITH META-REGRESSION

A. Rondoni[1], G. Rossettini[1], M. Strobe[1], F. Gallo[2], D. Ristori[1], M. Testa[1]. *[1]Department of Neuroscience, Rehabilitation, Ophthalmology, Genetics, Maternal and Child Health, University of Genova, Savona; [2]Department of Health Sciences, University of Genova, Genova, Italy*

Background: Economic impact of neck pain shows an increasing trend. In order to limit the costs of spine disorders management, it is important to assess clinical efficacy and the cost-worthiness of new technological devices, recently introduced in physical therapist's clinical practice
Objectives: This systematic review compares, in patients with non-specific neck pain, the reliability of measures of Active Cervical Range of Motion (ACROM) detected with technological devices with those assessed with low cost, common-use devices. As secondary outcomes, it was investigated if ACROM reliability depends on the plane on which the measured movement is performed
Methods: The literature search was carried out in Medline, Scopus, Embase, The Cochrane Library, CINHAL, PEDro and grey literature until August 2016. Inclusion criteria were: reliability design, population of adults with nonspecific neck pain, examiners of any level of experience, measures repeated at least twice and statistics indexes on reliability. Exclusion criteria were: other study designs, asymptomatic population or mixed population, single or none ACROM measure, inadequate statistics. The risk of bias was assessed by QAREL. It was considered inexpensive a device that costs at maximum 500 euros. A Univariate, and a Multivariate Analysis, were performed by using the Linear Mixed-Effect Model
Results: Searching the databases yielded 35,151 records. Nine studies met all eligibility criteria. The QAREL mean score of the selected studies was 3.7 out of 11. No significant effect of the type of device (inexpensive versus expensive) on ICC was observed for intra-rater (ICC=0.93vs0.91 p-value>0.99) and inter-rater reliability (ICC=0.80vs0.87 p-value>0.99) [Table 1]. The plane of movement did not affect inter-rater reliability (p-value=0.11) while significantly influenced the intra-rater reliability (p-value=0.0001) assessed with low-cost devices. Intra-rater reliability significantly decreases (p-value=0.0129) in frontal plane movements (side bending) compared with movement on the sagittal plane (flexion-extension).

Table 1. Comparison of intra and inter-rater reliability between tool types

Characteristics	ICC Descriptive statistics	Mixed effect model	
	Mean (SD)	β (95% CI)	p-value
Intra-rater reliability			
Tool Type			0.99
Expensive	0.91 (0.07)	0	
Inexpensive	0.93 (0.02)	0.01 (-0.04 : 0.06)	
Direction			0.56
Flexion & Extension	0.91 (0.07)	0	
Rotation	0.95 (0.02)	0.03 (-0.01 : 0.07)	
Side Bending	0.92 (0.01)	0.01 (-0.02 : 0.04)	
Age	rho =0.29	0.00 (-0.01 : 0.01)	0.79
Inter-rater reliability			
Tool Type			0.99
Expensive	0.87 (0.09)	0	
Inexpensive	0.80 (0.12)	0.03 (-0.15 : 0.21)	
Direction			0.06
Flexion & Extension	0.82 (0.09)	0	
Rotation	0.86 (0.11)	0.04 (-0.02 : 0.11)	
Side Bending	0.77 (0.13)	-0.04 (-0.10 : 0.01)	
Age	rho =0.58	0.01 (-0.01 : 0.03)	0.43

Conclusions: The use of expensive devices to measure ACROM in adults with nonspecific neck pain does not seem to improve the reliability of the assessment. The assessment of side bending showed the lowest level of inter-raters reliability. Since the quality of the analysed studies is low, the conclusion of the present study should be taken cautiously

FRI0743-HPR THE ASSOCIATION OF PHYSICAL FITNESS COMPONENTS WITH SLEEP QUALITY IN WOMEN WITH FIBROMYALGIA: THE AL-ÁNDALUS PROJECT

M. Borges-Cosic[1], V. Segura-Jiménez[2], F. Estévez-López[1,3], I.C. Álvarez-Gallardo[2], V.A. Aparicio[4], P. Acosta-Manzano[1], B. Gavilán-Carrera[1], M. Delgado-Fernández[1]. *[1]Physical education and sport, University of Granada, Granada; [2]Physical Education, University of Cádiz, Cádiz, Spain; [3]Department of Psychology, University of Utrecht, Utrecht, Netherlands; [4]Department of Physiology, University of Granada, Granada, Spain*

Background: Fibromyalgia women report poorer sleep quality, fewer hours of sleep, greater nighttime awakenings, and non-restorative sleep compared with healthy people and other clinical populations (Diaz-Piedra et al., 2015). Previous literature has shown a positive effect of exercise training on sleep quality in women with fibromyalgia (Munguía-Izquierdo et al., 2008). Given the close relationship between exercising and physical fitness improvement, it is important to ascertain the individual influence of physical fitness components on sleep quality in this population.
Objectives: To examine the individual association of physical fitness components with sleep quality in women with fibromyalgia.
Methods: A total of 444 women with fibromyalgia (means±sd =51.3±7.5 years old) from Andalusia (southern Spain) were included in this cross-sectional study. The Senior Fitness test battery was used to assess physical fitness. This battery consists of the chair sit-and-reach, back scratch, 30-second chair stand, arm curl, 8-foot up-and-go (lower score indicates better performance) and 6-minute walk tests, which assess lower body flexibility, upper body flexibility, lower body strength, upper body strength, speed agility and cardiorespiratory fitness, respectively. Sleep quality was measured using the total score of the Pittsburgh Sleep Quality Index (PSQI) questionnaire (greater score indicates worse sleep quality). Linear regression was used to explore the association of each physical fitness component with global sleep quality. Analyses were controlled for age, total body fat percentage, marital status, educational level, medication for relaxation/sleep and regular menstruation.
Results: Lower body flexibility (b=-0.033, β=-0.103), upper body flexibility (b=-0.031, β=-0.096), lower body strength (b=-0.191, β=-0.157), upper body strength (b=-0.111, β=-0.142) and cardiorespiratory fitness (b=-0.008, β=-0.154) were inversely associated with greater scores in the PSQI questionnaire (all, $p<0.05$). Speed-agility (b=0.282, β=0.128) was positively associated with the score in the PSQI ($p<0.01$).
Conclusions: The current study showed that higher physical fitness is generally associated with better sleep quality in women with fibromyalgia. It is important to mention that all the physical fitness components seem to be associated with sleep quality. Lower body strength and aerobic capacity were the components that showed the strongest associations with sleep quality. Future studies are warranted to elucidate the causality of these relationships.

FRI0744-HPR THE EFFECTIVENESS OF THE LOWER DOSE OF LASER TREATMENT ON KNEE OSTEOARTHRİTİS

E. Ekiz[1], K. Capaci[2], M. Korkmaz[3]. *[1]Physical therapy and rehabilitation, Alaşehir State Hospital, Manisa; [2]Physical therapy and rehabilitation, Ege University, Izmir; [3]Physical therapy and rehabilitation, Afyonkarahisar State Hospital, Afyonkarahisar, Turkey*

Background: During knee osteoarthritis (OA) therapy; medications, physical therapy modalities, exercises and surgical procedures are used. In previous studies, the benefits of low level laser therapy (LLLT) for pain in the low back, shoulder, elbow, and hand have reported.
Objectives: In this study we aimed to investigate the effectiveness of LLLT on pain, functional status, and quality of life in patients with knee osteoarthritis.
Methods: Patients with Kellgren-Lawrence stage 2–3 knee osteoarthritis were enrolled. It was planned as a prospective, randomized and double-blind study. Group 1 received active laser therapy and group 2 placebo laser therapy. Patients have been provided active/placebo laser therapy for two weeks (5 days a week, a total of 10 sessions). Patients were evaluated before, immediately after and 1 or 3 months after treatment. Outcome measurements included pain intensity at rest and at movement on visual analog scale, knee function using Western Ontario McMaster Universities Osteoarthritis Index (WOMAC) scale, active/passive joint range of movement, quality of life using Short form 36 (SF-36), and 15-meter walking distance, painless walking distance.
Results: In this study, we observed improvements in knee pain, 15-meter walking distance, WOMAC pain, stiffness and function scores, Lequesne index, and SF-36 physical function and social function ($p<0.05$) in active LLLT group. Also, significant improvements were detected in SF-36 physical role, mental health, vitality and emotional role parameters compared with placebo laser group ($p>0.05$).
Conclusions: The present study demonstrated that LLLT is safe and effective upon pain and functional parameters on knee osteoarthritis. However, we think further long-term studies which will include more patients in order to determine the priority and effectiviness are required.

DOI: 10.1136/annrheumdis-2017-eular.5187

FRI0745-HPR **INVESTIGATION OF ASSOCIATION BETWEEN WRIST PAIN, FUNCTIONAL PERFORMANCE, GRIP AND PINCH STRENGTH IN CHILDREN AND ADOLESCENTS WITH JUVENILE IDIOPATHIC ARTHRITIS: CROSS-SECTIONAL STUDY**

S.N. Arman[1], E. Tarakci[2], O. Kasapcopur[3]. *[1]Department of Physiotherapy and Rehabilitation, Faculty of Health Science; [2]Department of Physiotherapy and Rehabilitation, Faculty of Health Science; [3]Medical Faculty of Cerrahpasa, Department of Pediatric Rheumatology, Istanbul University, Istanbil, Turkey*

Background: Juvenile idiopathic arthritis (JIA), among the most common chronic diseases of childhood, can be associated with pain. reduced range of motion, decreased muscle strength and functionality (1).
Objectives: The aim of this study was to assess the relationships between wrist pain and functional performance, grip and pinch strength in children and adolescents with JIA.
Methods: Cross-sectional study design was included 42 (36 female. 6 male) children and adolescents with JIA aged between 8 and 18 years. Patients who have at least one affected wrist included in the study. Sociodemographic data and clinical features were assessed by physical therapists. Hand grip strength was assessed with Jamar dynamometer Lateral, tip and palmar pinch strengths were assessed with Baseline pinchmeter. Wrist pain during the activity was evaluated with Numeric Rating Scale (NRS). A score of 0 indicated "no pain" and 10 indicated "extreme pain" for NRS. Functional performance of hand was assessed with "Jebson Taylor Hand Functional Test" (JTHFT). JTHFT consists 7 subtests: writing a 24-letter. card turning, picking up small common objects and placing them in a container, stacking checkers, stimulated feeding, moving light objects and moving heavy objects. All tests except writing performed on both right and left hand for JTHFT.
Results: The mean age and duration of disease was 13.05±3.04 (age range 8–18) and 6.55±3.78 years. respectively. Patient population consisted of 28 patients with polyarticular arthritis. 14 patients with oligoarticular arthritis. 39 of 42 patient's wrists were affected bilaterally. Significant relationships were found between writing and right palmar pinch strength (r= -0.34 p=0.023), right hand grip strength and right stimulated feeding (r=-0.32 p=0.039), left hand grip strength and left moving heavy objects (r=-0.33 p=0.028). Also, significant relationships were found between right lateral pinch strength and stimulated feeding (r=-0.33 p=0.028) and right stacking checkers (r=-0.31 p=0.039). For right side, significant relationships were found between palmar pinch and moving light objects (r=-0.35 p=0.020), moving heavy objects (r=-0.32 p=0.039), stimulated feeding (r=-0.36 p=0.017), stacking checkers (r=-0.36 p=0.017), card turning (r=-0.34 p=0.026) and JTHFT-total (r=-0.40 p=0.008).
Conclusions: The results of our study showed that hand grip and pinch strengths considerably decreased in children and adolescents with JIA, according to the normal means of the grip strengths of healthy children and adolescents reported in the literature (2). Our study suggested that decreased hand grip and pinch strengths may result impairment daily functions but wrist pain does not effect grip strengths or functional performance in children and adolescents with JIA. Therefore, we conclude that the grip training program will be effective in improving the functional performance of children and adolescents with JIA.

FRI0746-HPR **THE FACTORS AFFECTING STAIR CLIMBING IN PATIENTS WHO HAVE AN AFFECTED KNEE JOINT WITH OLIGOARTICULAR JUVENILE IDIOPATHIC ARTHRITIS**

S.N. Arman[1], E. Tarakci[1], O. Kasapcopur[2]. *[1]Division of Physiotherapy and Rehabilitation, Faculty of Health Science; [2]Department of Pediatric Rheumatology, Medical Faculty of Cerrahpasa, Istanbul University, Istanbil, Turkey*

Background: Juvenile idiopathic arthritis (JIA) encompasses a complex group of disorders with arthritis as a common feature. Patients with JIA may experience significant disability owing to muscular weakness, joint pain, contracture, and reduced mobility. Stair climbing performance is frequently used as a measure of lower extremity funtions in patients with chronic disease.
Objectives: The aim of this study was to investigating the factors affecting stair climbing in patients who have an affected knee joint with oligoarticular JIA.
Methods: 30 patients (aged 6–18 years) who have an affected knee joint with oligoarticular JIA were included in this study. Active range of motion (AROM) of knee was evaluated with universal goniometer. Muscular strength was estimated at maximal isometric force for the muscles of the lower extremities by using a portable handheld dynamometer (Lafayette, LA). Postural balance control was evaluated by using the Flamingo Balance Test (FBT). Static balance was measured by using the Functional Reach Test (FRT). Stair climbing performance was assessed with 10-stair climbing test (10SCT). All tests were performed thrice and the mean values of all were recorded. Relations between the factors affecting stair climbing in JIA were assessed by multiple linear regression analysis.
Results: The mean age was 9.63±2.76 and the mean disease duration was 4.41±2.16 years. Significant relationships were found between 10SCT and hip flexion muscle strength (r=-0.45 p=0.013), hip external rotation muscle strength (r=-0.48 p=0.007), knee extension muscle strength (r=-0.45 p=0.015) and dorsiflexion muscle strength (r=-0.37 p=0.044). According to linear regression analysis, stair climbing performance was affected by only hip flexion muscle strength (β=-0.40 p=0.026). However, it was not found relationships between AROM, FRT, FBT and 10SCT ($p>0.05$).
Conclusions: Stair climbing is a biomechanically complex activity of daily life for children. In current study, it was found that stair climbing performance was related with lower extremity muscle strengths in patients with JIA. Althought patients with JIA had only one affected knee joint, hip flexion muscle strength was primary predictor of stair climbing performance. We suggested that stair climbing performance should be considered in patients with juvenile idiopathic arthritis. Thus, not only affected joint, but also all lower extremity joints should be assessed multidimensionally.

FRI0747-HPR **FEASIBILITY OF FOUR QUESTIONNAIRES TO EVALUATE PATIENT EDUCATION FOR PEOPLE WITH INFLAMMATORY ARTHRITIS**

R. Røe[1], K. Gronning[2], L.R. Eriksson[1], H.A. Zangi[3] on behalf of the Norwegian patient education expert panel. *[1]Dept. of Rheumatology, Diakonhjemmet Hospital, Oslo; [2]Department of Public Health and Nursing, Center for Health Promotion Research, Norwegian University of Science and Technology, Trondheim; [3]National Advisory Unit on Rehabilitation in Rheumatology, Dept. of Rheumatology, Diakonhjemmet Hospital, Oslo, Norway*

Background: No core set of outcomes to evaluate patient education (PE) programmes exists. Evaluation of existing outcome measures is recommended[1]. A Norwegian expert panel comprising patients and health professionals experienced in patient education (PE) participated in a 3-round Delphi-process. The aim of the process was to obtain consensus about outcome domains that might be influenced by PE for people with inflammatory arthritis (IA). Six domains were identified: Understanding disease and treatment, knowledge about healthy life style, coping strategies, self-efficacy, empowerment and communication with health professionals. Through a systematic literature search and further Delphi-rounds, the expert panel identified four patient-reported outcome measures (PROMs) that might capture these outcome domains.
Objectives: To test the feasibility of four identified PROMs suitable to evaluate patient education programmes.
Methods: Arthritis Self-Efficacy Scales (ASES) for pain and symptoms, Effective Consumer Scale (EC-17), Health Education Questionnaire (heiQ) and Patient Activation Measure (PAM) were tested in 13 PE programmes for people with IA at six rheumatology departments in Norway. The PROMs were divided into two test-sets, set A (ASES, EC-17 and PAM) and set B (ASES and heiQ). Data were collected before, immediately after and 3 months after PE programmes. The instruments were tested for missing values, internal consistency (Cronbach's α) and ability to detect change. Floor and ceiling effects were considered to be present if more than 15% of the patients achieved the lowest or highest possible score on each item.
Results: 104 patients answered the questionnaires before participation in a PE programme, 63 in group A and 41 in group B, respectively. 96 (92%) answered the questionnaires after intervention and 78 (75%) responded at 3-month follow-up. Missing values were few in all PROMs (range 0–1.7%). Cronbach's α was acceptable in ASES pain (0.75) and ASES symptoms (0.81), EC-17 (0.91) and PAM (0.78). HeiQ comprises eight separate subcategories; seven categories had acceptable Cronbach's α (0.72–0.86). All PROMs showed statistically significant improvements after the PE programmes. At 3-month follow-up statistically significant changes were found only in EC-17 (p=0.01, SRM 0.4) and three heiQ subcategories; emotional distress (p=0.01, SRM 0.5), skill and technique acquisition (p=0.02, SRM 0.5) and health service navigation (p=0.02, SRM 0.5). There were ceiling effects in all PROMs at baseline, 10/13 items in PAM, 5/17 in EC-17, 3/11 in ASES and 14/40 in heiQ. No floor effects were detected in any of the PROMs.
Conclusions: Based on this pilot study in patients with IA, EC-17 and three of the heiQ subcategories were the most feasible PROMs in terms of internal consistency and ability to detect change. Although ASES did not exhibit significant changes at 3-month follow-up, it should be considered as an outcome measure, because it is the only instrument to measure self-efficacy.

FRI0748-HPR CROSS-CULTURAL VALIDATION OF THE PORTUGUESE "RHEUMATOID ARTHRITIS IMPACT OF DISEASE" SCORE: CROSS-SECTIONAL STUDY

R.J.O. Ferreira[1,2], L. Gossec[3], S. Hewlett[4], C. Duarte[1,5], J.K. Nicklin[4], J.A.P. da Silva[1,5], M. Ndosi[4]. *[1]Centro Hospitalar e Universitário de Coimbra; [2]UICiSA:E, Escola Superior Enfermagem de Coimbra, Coimbra, Portugal; [3]Paris 06 University, Paris, France; [4]University of the West of England, Bristol, United Kingdom; [5]Faculdade de Medicina da Universidade de Coimbra, Coimbra, Portugal*

Background: The Rheumatoid Arthritis Impact of Disease (RAID) score[1] assesses 7 impact domains of interest for people with rheumatoid arthritis (RA). Its use in research and clinical practice has been growing, and it is already translated into over 70 languages[2] but the cross-cultural validity of the Portuguese RAID has not been well established.
Objectives: To validate the Portuguese RAID for use in Portugal.
Methods: This was a single centre, cross-sectional validation study involving 2 phases: (i) cognitive debriefing with 38 patients to determine comprehension of the existing[2] Portuguese RAID (ii) cross-cultural validation using data from adult patients who were willing and able to complete the Portuguese RAID unaided. Analyses included fit to the Rasch model (implying construct validity, reliability and statistical sufficiency), tests for unidimensionality and invariance across different patient subgroups i.e. age, gender, education background, disease duration, function and culture. To test invariance to culture, the Portugal dataset was compared with datasets from France (n=195) and the UK (n=205).[3] RUMM2030 software was used in all analyses.
Results: Phase I led to minor changes in phrasing 3 items to enhance understanding and conceptual equivalence between the original RAID and the Portuguese version. In Phase II, 288 patients were included: mean (SD) age=60 (12) years, 82% females, 76% with disease duration ≥5 years, 30% on biologics. The Portuguese RAID was shown to have adequate fit to the Rasch model and high internal consistency (Table 1). Unidimensionality and invariance to age, gender, disease duration and function were confirmed (data not shown). The scale was well targeted for patients with different levels of disease impact (Figure 1). Pooling the datasets from Portugal, France and the UK revealed no cultural response bias (Table 1). RAID was then calibrated into logit-based scores to enable parametric analyses and bias-free cross-cultural comparisons if desired (data not shown).

Table 1. Results of Rasch analysis from pooled data

Country	N	RAID (n items)	Fit Residual Mean (SD)		Chi² Interaction		Person Separation Index
			Item	Person	Value (DF)	p-value	
Portugal	288	7	-0.13 (2.53)	-0.67 (1.60)	40.50 (35)	0.24	0.94
UK	205	7	0.22 (1.72)	-0.44 (1.37)	40.50 (35)	0.17	0.93
France	195	7	0.19 (1.99)	-0.71 (1.57)	25.69 (21)	0.22	0.91
Pooled	688	7	-0.06 (3.48)	-0.65 (1.55)	94.88 (63)	0.01	0.93
		6*	-0.34 (3.88)	-0.63 (1.44)	66.04 (54)	0.13	0.93
Expected values for perfect fi			0 (1)	0 (1)		>0.05	>0.85

DF, degrees of freedom; *6 items for cross-cultural comparisons (items 2 "Function" and 5 "Physical well-being" combined).

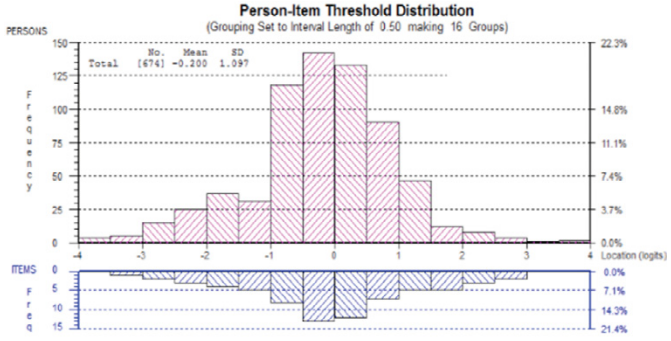

Figure 1. Distribution of items and persons along the same scale (logit score) confirming good targeting of the RAID.
The x-axis is the logit score and represents the interval scaling of the items according to the Rasch model, with –4 being no impact and 4 being high impact of disease.

Conclusions: This study confirms the Portuguese RAID as a robust unidimensional tool for use in Portugal. The raw scores of the 7-item RAID can be used with confidence in clinical practice. Conversion charts are available to enable accurate cross-cultural comparisons across Portugal, France and the UK.

FRI0749-HPR THE EFFECT OF A SUPPORTED OSTEOARTHRITIS SELF-MANAGEMENT PROGRAM ON PHYSICAL ACTIVITY, PAIN, QUALITY OF LIFE AND SELF-EFFICACY. AN INTERVENTION STUDY WITH A REFERENCE GROUP

T.S.J. Jönsson[1], C.A. Thorstensson[2], E. Ekvall Hansson[3], L. Dahlberg[4]. *[1]Department of orthopaedics, Institute of Clinical Sciences, Lund; [2]Department of Clinical Neuroscience and Rehabilitation, Institute of Neuroscience and Physiology, Gothenburg; [3]Department of Health Sciences, Division of Physiotherapy; [4]Department of Orthopedics, Institute of Clinical Sciences, Lund, Sweden*

Background: People with osteoarthritis are less physical active than others and a large part are sedentary. It is unclear how to increase the physical activity level for patients with osteoarthritis.
Objectives: The primary aim of this study was to evaluate the effects from an evidence based supported osteoarthritis self-management program in patients with knee or hip osteoarthritis on physical activity. Secondary aim were to evaluate the effect on pain, quality of life and self-efficacy.
Methods: An intervention study with a reference group in which 104 patients (29–75 years) with knee (n=84) or hip (n=20) osteoarthritis participated in the intervention. Patients were referred to a supported osteoarthritis self-management program that include physical therapist delivered information and individually adapted exercise. The reference group comprised 28 patients (49–75 years) with knee (n=16) or hip (n=12) osteoarthritis from the waiting list at an orthopedic university clinic. Outcome measurements were made at baseline, 3 and 12 months. Physical activity were objective measured with an accelerometer. The secondary outcomes were patient reported, Visual Analog Scale (VAS) were used to measure pain, EQ-5D to measure quality of life and Arthritis Self Efficacy Scale to measure self-efficacy.
Results: The supported osteoarthritis self-management program did not improve physical activity *(p=0,77)* between baseline and 3 month follow up compared to the reference group. But it did improve pain (*p=0,02*), quality of life (*p=0,002*), self-efficacy-other (*p=0,015*) and self-efficacy-pain (*p=0,033*) between baseline and 3 month follow up compared to the reference group. The improvements in pain and quality of life in the intervention group persisted at 12 month follow-up.
Conclusions: The supported osteoarthritis self-management program delivering information and individualized exercise according to the national program BOA in Sweden improved pain, quality of life and self-efficacy. Despite these results, the physical activity level were not improved. More research on how to improve the physical activity in patients with osteoarthritis is needed.

FRI0750-HPR CONSTRUCT VALIDITY OF THE INTERNATIONAL PHYSICAL ACTIVITY QUESTIONNAIRE – LONG FORM IN PATIENTS WITH AXIAL SPONDYLOARTHRITIS

T.W. Swinnen[1,2,3], S. Willemijns[2], W. Dankaerts[1], R. Westhovens[2,3], K. de Vlam[2,3]. *[1]Research Group for Musculoskeletal Rehabilitation; [2]Skeletal Biology and Engineering Research Center, KU Leuven; [3]Division of Rheumatology, University Hospitals Leuven, Leuven, Belgium*

Background: Physical activity (PA) is increasingly recognized as an important outcome measure in patients with axial spondyloarthritis (axSpA). Indeed, PA interventions in axSpA have shown to improve clinical status and to reduce comorbidity. The International Physical Activity Questionnaire-Long Form (IPAQ-LF) may be a feasible self-reported PA measurement tool, but its validity is unknown in axSpA.
Objectives: To establish the convergent construct validity of the IPAQ-LF in axSpA.
Methods: Forty patients with axSpA (Male/Female: 24/16; Mean±SD, Age:44.38±11.30 yrs, BMI: 26.27±5.11 kg/m^2, disease duration: 11.40±9.50 yrs, disease activity (BASDAI): 3.69±2.59) completed the IPAQ-LF and wore the SenseWear Pro3 Multisensor Armband during five consecutive days (three weekdays and two weekend days). A priori, significant directional associations

evidenced by Spearman correlation coefficients of ≥.50 were hypothesized between IPAQ-LF total or its subscales and the armband to conform convergent construct validity (p<.05).
Results: IPAQ-LF total PA (Median (IQR): 16.71 (5.91–45.15) MET.hrs/day) was associated with Physical Activity Level (r=.434, p<.01), moderate to (very)vigorous PA (MET≥3, r=.439, p<.01), moderate PA (MET ≥3<6, r=.432, p<.01) and inactive time (MET≤1.8, r=-.382, p<.05) obtained with the armband. Similar, IPAQ-LF moderate PA (Median (IQR): 10.39 (2.41–23.71) MET.hrs/day) was related with PAL (r=.492, p<.01), moderate to (very)vigorous PA (r=.456, p<.01), moderate PA (r=.444, p<.01) and inactive time (r=-.491, p<.05). Also, IPAQ sitting (Median (IQR): 14.91 (10.89–20.80) hrs/day) was correlated to PAL (r=-.461, p<.01), moderate to (very)vigorous PA (r=-.391, p<.05), moderate PA (r=-.386, p<.05) and inactive time (r=.496, p<.01). No relevant nor significant correlations were found for the other IPAQ-LF subscales. Taken together, no hypothesis could be confirmed.
Conclusions: Even at a group level, the convergent construct validity of IPAQ-LF in axSpA was not confirmed. Self-reported PA outcomes may provide important contextual information on PA, but perform poor at quantifying PA levels in axSpA. Future research on a feasible self-reported PA measurement tool for these patients is required.

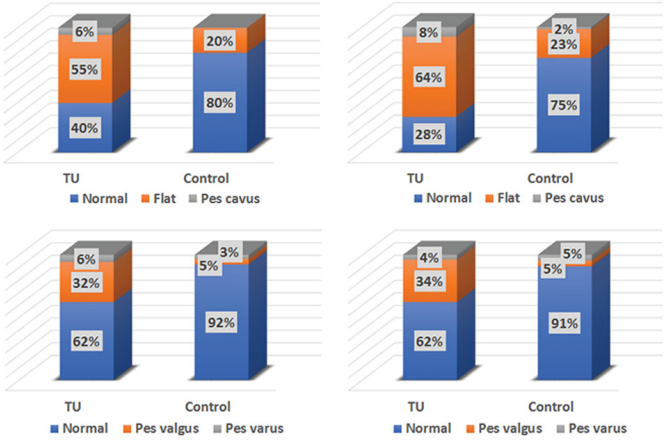
HPR epidemiology and public health (including prevention)

FRI0751-HPR SAFETY PROFILE OF TOFACITINIB IN PATIENTS WITH RHEUMATOID ARTHRITIS - A REAL WORLD EXPERIENCE WITH GOOD RESULTS



A. Malpica[1], P. Santos-Moreno[2], K. Mendez[3], D. Buitrago-Garcia[1].
[1]Epidemiology; [2]Rheumatology; [3]Pharmaceutical chemist, Biomab, Center for Rheumatoid Arthritis, Bogota, Bogota, Colombia

Background: Tofacinitib is an oral Janus Kinase for the treatment for rheumatoid arthritis (RA). The efficacy and safety of tofacitinib in monotherapy or in combination with other DMARDs has been demonstrated in clinical trials. However previous studies had report hematological changes and infections associated to the use of this medication (1, 2); in the European Union (EU) Tofacitinib is an investigational medicine and has not been approved for use because concernings regarding its safety.
Objectives: We aim to describe the safety profile of Tofacitinib in patients with RA in in a real-life setting in Bogotá, Colombia.
Methods: During 2015- 2016 we followed patients from a RA specialized center in Colombia receiving Tofacinitib. Patients were treated with therapeutic goals T2T and a multidisciplinary approach. Adverse events were classified according the Common Terminology Criteria for Adverse Events (CTCAE) of the World Health Organization. Descriptive epidemiology for continuous variables, measure of central tendency and dispersion for qualitative and categorical variables through percentages and averages were calculated.
Results: We included 56 patients receiving tofacitinib, 80% were woman, 20% men. Mean age was 60±11 years. The mean time with RA was 17 months ± 12. 70% of patients had comorbidities; the most frequent comorbidity was hypertension 30%, followed by osteoporosis 25%, 7.5% Sjogren's syndrome, 7.5% diabetes mellitus among others. 70% of patients received some Anti-TNF drugs before using Tofacitinib; average time receiving tofacitinib was 33±32 weeks, mean DAS28 was 3.7±1.6. Regarding safety profile 10 of 56 patients presented any adverse event. 5 were mild, 4 moderate and 1 severe (1.7%). Diarrhea 1, Infections 1, Abdominal discomfort 3, Mouth papules 1, Rash 1, Sinusitis 1, Headache 1, Folliculitis 1 and Pancreatitis 1.
Conclusions: Tofacitinib is a safe and effective medication for patients with AR; regarding safety the proportion of patients with any AE is lower compared to previous studies, but the type of events were similar to clinical trials (1); none of our patients presented hematological changes; none of our patients presented Herpes Zoster infection.

FRI0752-HPR COMPUTER PODOMETRIC MEASURING SYSTEM IN ASSESSMENT OF FLAT FEET AND LOWER LIMBS DEFORMITIES IN PATIENTS WITH SYSTEMIC SCLEROSIS

R. Michalik[1], A.J. Owczarek[1], P. Kotyla[2], J. Chudek[3], P. Antończak[4], E. Kucharz[2]. *[1]Department of Statistics, SPLMS in Sosnowiec, Medical University of Silesia in Katowice, Sosnowiec; [2]Department of Internal Medicine and Rheumatology; [3]Department of Pathophysiology, SMK in Katowice, Medical University of Silesia in Katowice, Katowice; [4]Department of Cosmetology, SPLMS in Sosnowiec, Medical University of Silesia in Katowice, Sosnowiec, Poland*

Background: Systemic sclerosis (SSc) is a connective tissue disease characterized by an excessive collagen production, fibrotic changes in the skin, internal organs, and vascular involvement. Patients with SSc may have pathological changes in their joints, especially in feet that enclosed: flat feet, valgus or varus foot, hallux valgus, tendinopathy, foot ulcers, joint space narrowing, joint subluxation and degenerative changes [1, 2].
Objectives: The aim of the study was to assess occurrence and the severity of lesions and deformities of spine and joints of lower limbs, especially of feet, in patients with SSc, in comparison to the healthy volunteers.
Methods: All subject have anamnesis, anthropometric tests, and feet assessment with the computer podometric measuring system.
Results: The study enclosed 53 patients with SSc (69.8% female) in mean age 55±12 and 65 healthy volunteers (53.8% female) in mean age 45±15. Disease duration median was 3 years (IQR =6). In comparison to healthy volunteers, patients with SSc have more frequent flat feet and pes valgus (p<0.001) – Figure 1. No significant differences (p=0.96) were observed in round back (8% both groups) and round-concave back (28% vs. 30%) occurrence. Patients with SSc have diminished spine mobility (15.06±5.52 vs. 26.09±6.52 [cm]; p<0.001), to small knee-joint and ankle flexion/extension regardless of body side, more often hallux valgus and longitudinal flat foot. No differences were observed in transverse flat foot and heel varus/valgus occurrence.

Abstract FRI0752-HPR – Table 1. Results of ANOVA with repeated measurements in SSc and control group with comparison between feet

Group	TU		Control		ANOVA		
Variable	Right	Left	Right	Left	p_{group}	p_{foot}	$p_{group*foot}$
Knee-joint flexion (°)	108.7±11.9	107.4±12.6	136.2±6.8	136.2±6.7	**<0.001**	0.61	0.63
Knee-joint extension (°)	0.13±3.86	-0.68±4.22	-1.29±1.63	-1.28±1.74	**<0.05**	0.34	0.32
Ankle flexion (°)	8.7±4.8	9±5.4	18.9±2.2	18.8±2.2	**<0.001**	0.82	0.73
Ankle extension (°)	32.8±10.9	31.6±10	45±4.3	44.9±4.5	**<0.001**	0.53	0.58
Computer podometric measuring system							
Hallux valgus angle α (°)	10.5±7.2	12.0±8.8	7.7±5.6	7.8±6.4	**<0.01**	0.22	0.26
Hallux varus angle β (°)	15.9±5.1	15.6±5.9	15.3±4.1	16.1±4.4	0.98	0.39	0.09
Heel angle γ (°)	14.3±1.6	14.4±1.8	14.3±1.4	14.7±1.4	0.59	0.06	0.15
Godunov- Sztriter Index (KY)	0.45±0.12	0.46±0.16	0.42±0.06	0.43±0.08	**<0.05**	0.46	0.68
Chippaux-Smirak Index (CSI)	0.38±0.09	0.40±0.11	0.29±0.09	0.30±0.09	**<0.001**	**<0.01**	0.06
WGWP	24.9±4.3	24.4±6.4	28.4±2.7	28.1±3.9	**<0.001**	0.48	0.82
Wejsflog Index	2.56±0.1	2.57±0.1	2.58±0.08	2.58±0.09	0.35	0.80	0.48

WGWP - The index of depth of the longitudinal arch of the foot.

Conclusions: Patients with SSc have a relatively high prevalence of feet pathological deformities and a smaller range of flexion of the joints than the lowest normal range, but mostly normal curvature of the spine.

FRI0753-HPR PAIN SPREAD AND PAIN INTENSITY IMPROVE OVER TIME IN WOMEN WITH FIBROMYALGIA AND CHRONIC WIDESPREAD PAIN. A 12 YEAR FOLLOW UP STUDY

A. Bergenheim[1,2,3], S. Johannesson[3], L. Nordeman[1,2], M. Joelsson[3], K. Mannerkorpi[2]. *[1]Närhälsan Research and Development Primary Health Care, Region Västra Götaland; [2]Institute of Neuroscience and Physiology/Physiotherapy, Sahlgrenska Academy, University of Gothenburg, Göteborg; [3]Närhälsan Rehabilitation Centres, Region Västra Götaland, Sweden*

Background: In the Western world, the prevalence of chronic widespread pain (CWP) is about 10–15% while Fibromyalgia (FM) affects approximately 1–3% of the population. The ACR 1990 criteria define CWP as pain ≥3 months on the right and left side of the body, above and below the waist and axial skeletal pain. The 1990 criteria for FM are CWP in combination with pain in ≥11 of 18 tender points on manual palpation. Previous studies indicate that some patients with FM or CWP improve over time and the key to improvement is an important question in research and clinical practice.

Objectives: The primary objective was to investigate the change of pain intensity and pain distribution after 12 years in 166 women with FM or CWP.

The secondary objective was to compare baseline values of health related variables between patients who fulfilled the criteria for FM/CWP at the 12 year follow-up and patients who did not.

Methods: In 2004, 166 women with FM or CWP participated in a randomized controlled trial in Sweden aiming to investigate effects of patient education and pool exercise. All 166 were invited to the present study in 2016 and 126 women (75%) participated. Data was collected by a standardized interview, questionnaires of health related aspects and a physical examination.

Primary, within-group changes were calculated for pain distribution (Bergman's pain drawing 0–18) and the subscale for pain intensity (0–100 mm) included in the Fibromyalgia Impact Questionnaire (FIQ).

Secondary, the group who fulfilled criteria for FM or CWP at follow-up were compared with the group who did not fulfil the criteria for FM or CWP, in overall health status (FIQ total), symptoms of stress (Stress and Crisis Inventory – SCI-93), walking capacity (6 min walk test), hand grip force (the Grippit) and self-reported physical activity (Leisure time physical activity instrument).

Results: Primary: The 126 women with FM or CWP improved in pain distribution: mean values at baseline 12.9 (SD 3.4) vs follow-up 11.4 (SD 4.7), $p<0.001$ and pain intensity: mean values at baseline 69 mm (SD 18.5) vs follow-up 59 mm (SD 22), $p<0.001$.

Secondary: 18% (n=23) of the 126 women did not fulfil the 1990 criteria for FM or CWP at follow-up, and they showed significantly better health status, lower symptoms of stress and higher walking capacity in 2004, than the women who still had FM or CWP at follow-up. Baseline mean values FM/CWP (n=123) vs Not FM/CWP (n=23): FIQ total 66 (SD 16) vs 55 (SD 15), p=0.006; SCI-93 80 (SD 23) vs 59 (SD 22), $p<0.001$; 6 min walk test 502 m (SD 86) vs 542 m (SD 80), p=0.028. No significant differences were found between the groups for baseline values of hand grip force and level of physical activity.

Conclusions: This study showed that distribution and severity of pain improved during 12 years in women with FM or CWP. The group that improved most (18%), reported better health status, lower stress and had better walking capacity 12 years earlier. This knowledge is important for health care professionals to motivate the patients to apply a variety of strategies, including physical activity, to improve their health and symptoms.

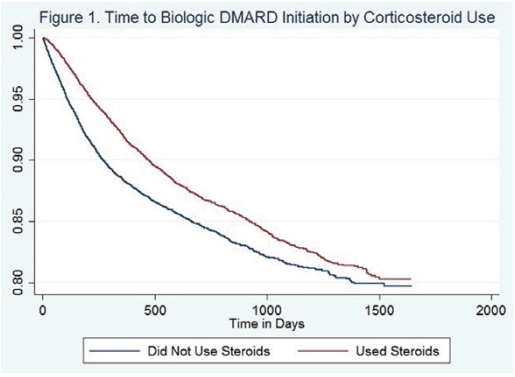
FRI0754-HPR IMPACT OF CORTICOSTEROID UTILIZATION ON BIOLOGIC DISEASE-MODIFYING ANTIRHEUMATIC DRUG INITIATION AMONG PATIENTS WITH RHEUMATOID ARTHRITIS



C.A. Spivey[1], J. Griffith[2], C. Kaplan[1], A. Postlethwaite[1], A. Ganguli[2], J. Wang[1]. *[1]University of Tennessee, Memphis; [2]AbbVie, North Chicago, United States*

Background: Treatment guidelines recommend low dose corticosteroids (steroids) as an effective short-term (<3 months) therapy among rheumatoid arthritis (RA) patients to "bridge" patients until benefits of disease modifying anti-rheumatic drugs (DMARDs) are observed and in flare management.[1] Physician quality reporting system (PQRS) measures in the US require a documented management plan for patients on steroids >10 mg/day and this may be a prompt to advance RA therapy. Understanding steroid treatment patterns and associated burden prior to biologic DMARD initiation can inform clinical and policy decision-makers on the appropriate use of these two drug classes in RA management.

Objectives: To examine effects of steroid treatment patterns on initiation of biologic DMARDs and adverse effects of steroid utilization before biologic DMARD initiation among patients with RA.

Methods: A retrospective analysis was conducted of adult RA patients (18 and older) in the US MarketScan Database (2011- 2015). The earliest date a patient was diagnosed with RA was the index date. The following patterns of oral and injectable steroid utilization were analyzed: whether steroids were used; duration of steroid use (short/long duration defined as < or ≥3 months); and steroid dosage (low as <2.5 mg/day, medium as 2.5-<7.5 and high as ≥7.5 mg/day). Kaplan-Meier survival analysis was used to compare time to initiation of first biologic DMARD across groups of steroid utilization. The effects of steroid use on initiation of biologic DMARDs were examined using Cox proportional hazards models. Likelihood and number of adverse events were examined using logistic and negative binomial regression models. Independent variables in all models included patient demographics and health characteristics.

Results: A total of 25,537 patients were included (40.82% used steroids). Based on Kaplan-Meier survival analysis, steroid users (Figure 1), those with longer duration, and in lower dosage categories had delayed time to initiation of a biologic DMARD than their counterparts (nonusers, those with shorter duration and higher dosages, respectively) ($P<0.001$). According to Cox proportional hazards model, lower hazard of biologic DMARD initiation was associated with steroid use ([HR]=0.89, 95% Confidence Interval [CI]=0.83–0.96, compared to nonusers), longer steroid duration (HR=0.73, 95% CI=0.60–0.89 compared to short duration) and lower dosages (HR=1.10, 95% CI=0.99–1.23 for medium dose and HR=1.93, 95% CI=1.59–2.34 for high dose compared to low dose). Higher likelihood of adverse events was associated with steroid use (Odds Ratio [OR]=1.13, 95% CI=1.06–1.20), and longer duration (OR=1.75, 95% CI=1.47–2.09) than their counterparts. Likelihood of adverse events did not significantly differ across dosages. Similar effects of steroid utilization were found on the number of adverse events.

Conclusions: The findings indicate that RA patients who use steroids, those with longer duration and lower dosages have delayed initiation of biologic DMARDS than their counterparts. RA patients who use steroids and those with longer duration have higher likelihood/number of adverse events prior to initiating biologic DMARDS.

FRI0755-HPR POTENTIAL BENEFITS OF BIOLOGICS ON CARDIOVASCULAR DISEASES AND ORTHOPEDIC SURGERIES IN PATIENTS WITH RHEUMATOID ARTHRITIS: A NATIONWIDE POPULATION-BASED COHORT STUDY IN TAIWAN

D.-Y. Chen[1], C.-H. Tang[2], F. Yu[3], C.-Y. Huang[4]. *[1]Division of Allergy, Immunology and Rheumatology, Taichung Veterans General Hospital, Taichung; [2]School of Health Care Administration, Taipei Medical University, Taipei; [3]Pfizer Ltd., New Taipei City; [4]Formosa Biomedical Technology Corp., Taipei, Taiwan, Province of China*

Background: Rheumatoid arthritis (RA) is a chronic, systemic inflammatory disorder, precipitating chronic inflammation of the joints, and also affects organs throughout the body, and even results in joint deterioration/disability. RA-related inflammation that is responsible for synovial lesions may be implicated in

the development of accelerated atherosclerosis, leading to increased risk of cardiovascular disease (CVD), and increased mortality.
Objectives: This study aimed at examining changes in the risk of deaths, CVD and RA-related orthopedic surgeries between the patients treated with conventional synthetic and biologic disease modifying antirheumatic drugs (csDMARD and bDMARD) for RA during 1997–2011.
Methods: Two cohorts of severe RA patients and their matched controls were identified from National Health Insurance claims database. The csDMARD cohort was patients who had medication claim for cyclosporine ≥50 mg/day with concomitant use of ≥2 csDMARDs for ≥28 days within 56 days after cyclosporine use during 1997–2003 (N=1,569). After csDMARD cohort was determined, the bDMARD cohort was selected if patients had ≥1 claim for bDMARD during 2003–2011 (N=1,530). Adjusted hazard ratios (aHRs) for the risk of death, myocardial infarction (MI), stroke, and RA-related orthopedic surgeries were assessed between the two cohorts and their controls, respectively, using Kaplan-Meier survival curves and Cox proportional hazards models.
Results: RA patients using bDMARD showed a markedly decreased risk of death (aHR:1.05; 95% CIs=0.84–1.33) compared with RA patients using csDMARD (aHR:8.75; CIs=7.43–10.31). Also, bDMARD was associated with a reduced risk of stroke (aHR:0.37; CIs=0.22–0.62) compared with csDMARD (aHR:0.73; CIs=0.51–1.05). For RA-related orthopedic surgeries, risks were slightly lower for bDMARD (aHR:4.14; CIs=3.30–5.20) compared with csMARD (aHR:5.77;CIs=4.88–6.81).
Conclusions: The introduction of biologics in the treatment of RA has showed to have beneficial impact on improving clinical outcomes, including decreased risks of death, stroke and RA-related orthopedic surgeries.

FRI0756-HPR EVALUATION OF MUSCULOSKELETAL COMPLAINTS ASSOCIATED WITH SMARTPHONE USE AMONG UNIVERSITY STUDENTS AND RELATED RISK FACTORS

E. Tonga, B. Özgül, E. Timurtas, M. Can, Y. Hasırcı, M.G. Polat. *Marmara University, Faculty of Health Sciences, Department of Physiotherapy and Rehabilitation, Marmara University, Istanbul, Turkey*

Background: Smartphone use for long periods in a static and unsupported arm position could bring about abnormal alignment of upper limb and could cause postural problems and musculoskeletal pain. There are very few studies in the literature that examine the effect of smartphone use on musculoskeletal problems and related factors.
Objectives: The primary aim of our study was to determine the musculoskeletal complaint associated with smartphone use among university students. other purpose of the study was to investigate the relationships with smartphone type, smartphone use frequency, smartphone use posture, smartphone use addiction level and psychological stress.
Methods: 349 university students (240 women, 109 men; mean age 20.79±1,35) were included to our study. We conducted a survey that contains questions about students' smartphone usage patterns and habits. Nordic musculoskeletal Questionnaire was used to determine the musculoskeletal complaint associated with smartphone use. Working posture while using smartphone were evaluated with Rapid Upper Limb Assessment (RULA). Smartphone addiction level were determined with Smartphone Addiction Scale (SAS). Also we use the Beck Depression İnventory (BDI) to determine the psychological distress. Pearson correlation analysis were used to associations between parameters.
Results: Our results showed that university students had a high frequency of smartphone use and that the frequency was related to the level of addiction (r=0.199 p=0.00). %43 of students were use their smartphones extremely more than 4 hours. Students specified that they use their smartphones often for messaging with smartphone applications (%86.5). the most frequent symptoms were found in the neck (%59.6), shoulder (%51.82) and upper back (%54.4) regions. Statistically significant relationship was found between daily frequency of smartphone use and RULA neck posture score (r=0.170, p=0.001). Also there were statistically significant relationships found between BDI score and upper limb (r=0.15, p=0.005) and upper back (r=0.152, p=0.004) postures while using smartphone.
Conclusions: Smartphone users complain at least one area (neck, upper extremity, upper back. The frequency of smartphone use and addiction level is associated with abnormal postures while using smartphones which associated physiological distress. Consequently, musculoskeletal rehabilitation programs should include an analysis of preventive strategies which should be multifactorial with the team work of all health professionals.

FRI0757-HPR NATURE OF JOINT INVOLVEMENT IN OSTEOARTHRITIS IN THE POPULATION: MULTI-JOINT OSTEOARTHRITIS, THE RULE NOT THE EXCEPTION?

E.M. Badley, D. Millstone, A.V. Perruccio. *Division of Health Care and Outcomes Research, Krembil Research Institute, Toronto, Canada*

Background: While population studies usually consider undifferentiated osteoarthritis (OA), cohort and other studies of OA typically focus on OA characterized by a primary joint involved, most frequently the knee, hip or hand. Relatively little attention has been paid to the involvement of other joints.
Objectives: To investigate the extent of multi-joint involvement in a representative sample of the population with OA.
Methods: Analysis of data from the Survey on Living with Chronic Diseases in Canada, Arthritis Component. This was based on a nationally representative sample of people aged 20 or older reporting arthritis as a long term health problem, diagnosed by a health professional, in the parent Canadian Community Health Survey, 2008. Respondents were asked about their type of arthritis, extent of pain on a 0–10 scale, and the extent to which arthritis affected their life (not at all; a little; moderately; quite a bit; extremely). Participants were also asked to indicate which joints were painful. The joints asked about were the right and left hands, wrists, elbows, shoulders, hips, knees, ankles, feet, back and neck. Data on other reported chronic health conditions (heart disease, respiratory, high blood pressure, migraines, mood disorders, bowel disorder/ulcers, stroke, cancer, and diabetes) and body mass index (BMI) were obtained from the parent survey. Analysis was restricted to people reporting OA (n=1749).
Results: The mean age of the sample was 65 years, with 44% aged less than 65; 74% were women. Ninety-three percent reported joint pain in the previous month. The mean "average" pain score was 5.2/10 with very little variation by age and gender. Overall, 92% reported that their arthritis affected their life at least a little, with 24% reporting quite a bit or worse, similarly with little variation by age and gender. The most frequently reported joint sites (e.g. one or both knees) were the knee (58%), hands (49%), back (47%), and hips (42%). Overall the sample was characterized by multi-joint involvement: only 10% reported only one troublesome joint, and 17% only one site. The mean number of painful joints was 5.6 (ranging from 1 to 18: median 5), and the mean number of joint sites was 3.9 (median 3). Women reported more joints than men (mean 5.9 vs 4.8) but there was no significant trend by age. There was no significant trend in number of joints by BMI, although the number of co-occurring conditions was higher in people with more painful joints; 25% of those with only 1–2 joints had a 2 or more co-occurring conditions, compared to 43% of those with 5 or more joints.
Conclusions: Although the most frequently reported painful joints were the knee, hip or hand, few people reporting OA in this representative population-based sample had joint symptoms in that joint alone, suggesting that studies that focus only on a primary joint may be missing the point. The lack of association of mean number of joints with obesity was surprising given a postulated metabolic contribution to OA. The association with co-occurring conditions needs further investigation. A reappraisal of our understanding of OA appears to be warranted given that multi-joint involvement appeared to be the rule not the exception.

FRI0758-HPR CO-MORBIDITY PROFILE IN PATIENTS WITH RHEUMATOID ARTHRITIS. DATA FROM RHEUMATOID ARTHRITIS REGISTRY IN QATAR

F. Alam, M. Hammoudeh, S. Al Emadi. *Rheumatology section Internal Medicine, Hmc Doha, Doha, Qatar*

Background: Comorbid conditions are frequently associated with rheumatoid arthritis (RA) which not only increase morbidity but also has impact on treatment and may shorten the life span of those patients.
Objectives: To study the prevalence of different comorbid conditions among patients with RA.
Methods: Data was collected from rheumatoid arthritis Registry in Qatar. Patients fulfilling 2010 ACR/EULAR criteria for RA were included in this observational study from period of June 2013 to November 2015. Data about Baseline demographics, treatment pattern, disease scores and details of comorbid conditions were recorded in this observational study
Results: Data of 496 patients was analyzed. Demographic and disease characteristic of our RA cohort was as follows: 75.8% were female, 74.9% were positive for rheumatoid factor, 79.8% were positive for anti CCP and 31.3% have erosion at the time of data collection. One hundred thirty patients (26.4%) were receiving biologic drugs, 71.8 were on synthetic DMARDS (either as monotherapy or different combination) and 39.7% were receiving concomitant steroid.
The most commonly associated comorbid conditions were hypertension (24.2%) followed by diabetes mellitus (20.6%), dyslipidemia 10.9%, hypothyroidism 10.9%, asthma and chronic obstructive disease 1.4%.

Steroid was used by 39.2% of patients with diabetes and hypertension.
Cardiovascular events (Ischemic heart disease and ischemic stroke) occurred in 2.2% of patients and 45.5% of patients with cardiovascular events were receiving concomitant steroid. Infections requiring hospital visit were recorded in 1.8% of patients; 77.8% of patients with infection were on biologic DMARD and 33.3% were receiving concomitant steroid.
Out of Two hundred seventy six patients who underwent DXA scanning for estimation of bone mineral density, 48.6% were having decrease bone density (37% osteopenia, 11.6% osteoporosis).
Steroid use was significantly associated with decrease bone density.
Conclusions: Comorbid conditions are frequently associated with Rheumatoid arthritis as observed in our cohort of patients. Patient care should not be focused only on arthritis care. All RA patients should be screened for comorbidities and treated accordingly in order to avoid their deleterious effect on patient health.

FRI0759-HPR COLLABORATION BETWEEN GENERAL PRACTITIONERS AND RHEUMATOLOGISTS TO MANAGE CARDIOVASCULAR RISK IN PATIENTS WITH RHEUMATOID ARTHRITIS PATIENTS

J. Weijers [1], S. Rongen-van Dartel [1,2], M. Hulscher [1], P. van Riel [1,2]. *[1]IQ healthcare, Scientific Institute for Quality of Healthcare, Radboud university medical center, Nijmegen; [2]Department of Rheumatology, Bernhoven, Uden, Netherlands*

Background: To reduce the risk of cardiovascular disease in rheumatoid arthritis (RA) patients, adequate cardiovascular risk management (CVRM) is necessary. CVRM implies assessment, treatment and monitoring of cardiovascular risk factors[1]. The updated EULAR guideline states that cardiovascular risk assessment should be considered at least once every five years in all patients with RA[2]. A few studies show suboptimal risk management in daily practice in selected groups of patients.
Objectives: This study aims to describe current performance of the CVRM recommendation in a hospital based RA population in the South of the Netherlands. In this region, general practitioners (GPs) and rheumatologists closely collaborate into manage RA patients' cardiovascular risk.
Methods: Due to the collaboration, CVRM is performed as a part of a transmural care program. The rheumatologist informs the GP when a patient has been diagnosed with RA. The patient is placed on a list for CVRM to be screened by a specialised nurse practitioner. As a part of the collaboration, laboratory results requested by the GPs and rheumatologists are collected in one digital patient record system. This system is used to check whether the RA patient's lipid profile was determined in the previous five years. If not, a letter with the listed patient is sent to the GP a reminder for screening the patient. In this study, we checked six months later whether lipid testing was ultimately performed.
Results: In 70% (n=475) of all 679 RA patients (mean age 63 (SD 9 years), 68% women and median disease duration of 7 years (IQR 3–11)) a lipid profile was determined in the previous five years.
Of the 204 non-screened RA patients, 98 had been screened after sending the letter to their GP (+48%), see Figure 1. No differences in gender and disease duration were found between the screened and non-screened patients (p=.46 and p=.25 respectively). By contrast screened patients were 10 years older compared to the non-screened patients (66 year (SD12) vs 56 (SD 15) year, $p<0.0001$).

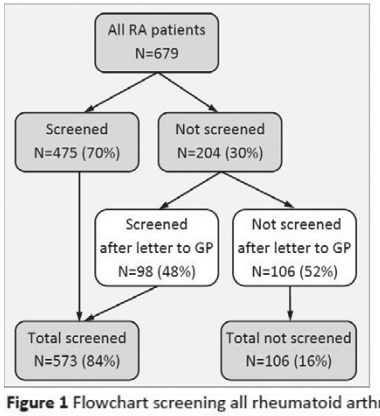

Figure 1 Flowchart screening all rheumatoid arthritis (RA) patients for their cardiovascular risk; results of sending a letter to general practitioners (GP).

Conclusions: As a result of the collaboration between GPs and rheumatologists, 70% of all RA patients was screened for CVRM. A small intervention, sending a reminding letter to the GP, increased this percentage even further, to 84%. This collaboration can be seen as a good practice to provide care in line with the EULAR guideline.

FRI0760-HPR BIOSIMILAR USE AMONG EUROPEAN RHEUMATOID ARTHRITIS PATIENTS AND IMPACT ON PATIENT OUTCOMES

L. Chanroux, F. Mboge, A. Wadiwalla. *Therapy Watch, Research Partnership, London, United Kingdom*

Background: Biologic agents have been shown to help control disease progression in rheumatoid arthritis (RA) and significant reduce joint damage. However, their considerable cost has limited their widespread use.
Objectives: Biosimilars offers the opportunity for significant cost savings for national health services and the aim of this research is to better understand their use among European rheumatologists and their potential impact on patient outcomes.
Methods: We used data collected as part of an online treatment survey conducted among a panel of 261 rheumatologists between January and December 2016 across 5 European markets (France, Germany, Italy, Spain and the UK). Physicians were sampled to provide a representative mix of practice types and regions. Our record form sample included 9,650 patient currently treated with a bDMARD, 297 of which received a biosimilar. We split the sample into 2 groups, biosimilar patients = those treated with Benepali (etanercept), Remsima (infliximab), Inflectra (infliximab) and Flixabi (infliximab) and originator patients = those treated with Enbrel (etanercept) or Remicade (infliximab). We analysed patient demographic data along with current DAS, joint count, HAQ score and perceived disease severity to assess response to therapy over time.
Results: Biosimilars accounted for a total of 2.4% of our biologic sample with the greatest uptake of these agents reported in the UK (3.8%) and the lowest in France (1.6%). Use of biosimilars increased in patients who started their current biologic in 2016 (8.1%), with a marginally higher use seen in patients on their 2nd or higher line of bDMARD therapy vs. those on their 1st bDMARD (9.4% vs. 7.5%, respectively).
We saw no significant difference in the distribution of biosimilar and originator patients by age and gender although biosimilar patients appeared to have more severe disease. While a smaller proportion of biosimilar patients were perceived to have moderate/severe RA at diagnosis (79.1% vs. 88.4%) a greater proportion were thought to have moderate/severe disease at their latest visit (64.3% vs. 44.2%). The average DAS28 of biosimilar patients was higher at a directional level but their average HAQ score and tender/swollen joint count were non-significantly lower. Biosimilar patients were more likely to suffer from a comorbid condition (87.2% vs. 74.1%) and a autoimmune condition beyond their RA (17.2% vs. 11.6%). There were no significant differences in the proportion of patients unable to work due to their disease (4.3% on average from the total sample).
We analysed the data focusing solely on 1st line patients to reduce any bias introduced by previous lines of therapy but observed similar trends. A higher proportion of biosimilar patients were considered to have moderate to severe RA at their latest visit (67.9% vs. 43.0%) and a greater proportion of patients had a DAS28 >5.1 (23.3% vs.3.0%).
Conclusions: Our research suggests that biosimilar uptake remains limited amongst European rheumatologists with a directional trend towards 2nd line use. Our data did not clearly show any significant differences in the profile of biosimilar patients or their outcomes. Increased governance from healthcare regulators and additional clinical data may be needed to further establish the efficacy and safety of these agents and drive their wider use, ensuring greater cost efficiency and the potential for wider access to biologic therapies for RA patients.

FRI0761-HPR CHRONIC WIDESPREAD PAIN PREVALENCE IN THE GENERAL POPULATION: A SYSTEMATIC REVIEW & META-ANALYSIS

P. Andrews, M. Steultjens, J. Riskowski. *Health and Life Sciences, Glasgow Caledonian University, Glasgow, United Kingdom*

Background: Chronic widespread pain (CWP) is a worldwide health problem and a significant contributor to disability. Understanding the impact of individual-dependent (e.g., gender) and contextual-dependent (e.g., survey method, latitude) factors have on CWP prevalence may provide a foundation population-based strategy for addressing CWP.
Objectives: To determine a general population worldwide estimate of CWP prevalence and to examine the individual and contextual-dependent factors related to CWP prevalence.
Methods: A systematic review was undertaken using seven databases. Along with data extracted from the manuscripts, additional contextual data including WHO development status and region, human development index (HDI; measure

Abstract FRI0761-HPR – Table 1. Individual- and contextual-dependent variables

		Random Effects Pooled Prevalence					Univariate Meta-regression	
		Studies	Estimates	Pooled Estimate	95% CI	I^2	I^2	p-value
Gender	Males (n=242808)	11	11	6.7	4.5–8.8	98.6	98.8	<0.01
	Females (n=290395)	11	11	10.9	8.1–13.7	98.7		
WHO Geographical Region	Europe (n=595876)	17	21	9.1	7.1–11.2	99.8	99.7	0.208
	Americans (n=16611)	6	6	10.9	5.1–16.7	99.4		
Latitude	<37° (n=6651)	6	6	10.5	4.5–16.5	98.9	99.8	0.622
	>37° (n=612233)	19	23	9.2	7.3–11.1	99.8		
Survey Type	Personal (n=551483)	18	22	10.0	7.7–12.3	99.5	99.5	0.746
	Non-Personal (n=67401)	7	7	7.8	4.8–10.7	99.4		
WHO Development Status	Developed (n=611999)	21	25	8.7	7.0–10.5	99.7	99.7	0.084
	Developing (n=6885)	4	4	13.9	6.4–21.4	98.5		
Socioeconomic Measures	GINI Index (n=618884)	25	29				99.5	0.258
	HDI (n=618884)	25	29				99.4	0.002
Reporting Quality	High (n=583819)	17	21	10.0	7.5–12.5	99.8	99.7	0.237
	Low (n=583819)	8	8	8.0	5.8–10.2	98.4		

Key: "Studies" refer to number of manuscripts, while "Estimates" relate to the number of countries within a manuscript that provided CWP prevalence estimates.

of socioeconomic position), GINI coefficient (measure of inequality), and latitude were added. Methodological reporting quality was assessed using the STROBE checklist [1]. Meta-analyses were conducted to determine global CWP prevalence, and individual- and contextual-dependent factors were evaluated using meta-regression analyses.

Results: Thirty studies across 20 countries (630,654 participants) met the inclusion criteria. Studies varied in CWP diagnostic criteria, survey method, and reporting quality. Study CWP sample prevalence ranged from 1.4–24.0%, with CWP in men ranging from 1.1–15.3%, while in women it ranged from 1.7–22.1%. Estimated overall CWP prevalence was 9.4% (7.6–11.3%). By gender, the global CWP prevalence estimate in women was significantly higher than for men (10.9% [8.1–13.7%] v 6.7% [4.5–8.8%], $p \leq 0.01$; Table). A meta-regression of the contextual factors showed the HDI was related to CWP prevalence (p=0.002), while other measures such as survey type, methodological reporting quality and GINI index showed no significant effect.

Conclusions: Globally CWP affects one in ten individuals within the general population, with women more likely to experience CWP than men. HDI was noted to be the socioeconomic factor related to CWP prevalence, with those in more developed countries having a lower CWP prevalence than those in less developed countries. There was a lack of data from countries with a lower socioeconomic position, and further CWP data in these areas can help determine if there are socioeconomic effects associated with CWP prevalence and can refine the CWP prevalence estimate.

FRI0762-HPR PREVALENCE OF TOBACCO USE IN AUTOIMMUNE INFLAMMATORY RHEUMATIC DISEASES (AIRDS): EFFICACY OF COUNSELING IN QUITTING TOBACCO USE

S.S. Baghel, R. Rawat, R.D. Thakran, C. Messi, S. Kapoor, S. Garg, V. Kashyap, Q. Zaheer, A.N. Malaviya. *Rheumatology, Indian Spinal Injuries Centre, New Delhi, India*

Background: Autoimmune inflammatory rheumatic diseases (AIRDs) are chronic in nature and common presentation involves the musculoskeletal system. Off lately, the researches have proved the strong association of tobacco in the development of the disease and increasing severity as well as reducing treatment efficacy. Therefore, awareness about the deleterious effect of tobacco and counselling to quit the same should be an imperative part of the patient education.

Objectives: To assess the prevalence of tobacco use among patients with AIRDs and the effect of counselling on quitting tobacco.

Methods: AIRDs patients attending the rheumatology clinic, willing to participate in the survey were enrolled in this study. Tobacco use was categorized as active [smoking or oral tobacco use] or passive (when the patient was exposed to tobacco smoke).All the information collected in pre-design form, which included demographic information and current status of tobacco use. They were also counselled about the methods of quitting tobacco and its importance and short-term follow-up details were recorded.

Results: 361 patients were enrolled in this study, out of them 162 (44.87%) were tobacco-naive and 199 patients (55.12%) were either active or passive tobacco users, among them active tobacco user 113 (56.78%), and passive user 86 (43.21%).Active tobacco users were further classified into mild 53 (47%), moderate 50 (44%) and severe 10 (9%) users. Other characteristics were as follows; Female: Male ratio1.02:1 [F: M (183:178)], Rheumatoid arthritis 268 (74.2%) [F: M (171:97)], Spondyloarthropathy 93 (25.8%) [M: F (81:12)]. Residential details were: urban 284 (79%) and rural 79 (21%). Educational status: 28 (8%) illiterate, 148 (41%) basic education, 106 (29%) graduate, 79 (22%) postgraduate. Co-morbidities status: 123 (34%) having multiple co-morbidities and 238 (66%) have no co-morbidities.

276 (75%) patients were unaware of the ill effects of tobacco use in AIRDs whereas, remaining 85 (25%) were having little knowledge about it.

The results of persistent counselling and creating awareness with the help of audio-visual aids were 49/113 (43.4%) quit from the active user's category, whereas, 64/113 (56.6%) were unable to quit. Among passive users, 9/86 (10.46%) could able to quit whereas in a large significant number of patients follow-up information could not be obtained.

Conclusions: The use of tobacco was significantly higher in males (61.80%) than females (38.19%).But females were mainly passively exposed to tobacco. By an intense and regular counselling by the specialist rheumatology nurses; 43.4% of active and 10.4%, passive users were able to quit tobacco.

FRI0763-HPR INVESTIGATING THE CLINICAL AND COST BURDEN OF PRIMARY SJÖGREN'S SYNDROME: A DESCRIPTIVE ANALYSIS FROM A US ADMINISTRATIVE CLAIMS DATABASE

S. Perera[1], L. Ma[2], R. Punwaney[3], S. Ramachandran[4]. *[1]GSK, London, United Kingdom; [2]GSK, Pennsylvania; [3]GSK, New York; [4]GSK, King of Prussia, United States*

Background: There is limited information available describing the disease burden of primary Sjögren's Syndrome (pSS).

Objectives: This retrospective cohort study aimed to provide a descriptive analysis of the clinical characteristics and disease burden of patients with pSS and describe their healthcare resource use and associated costs.

Methods: This retrospective cohort study (HO-15–16077) was conducted in the US Truven MarketScan® Commercial database. This database reports descriptive data from employees and their families, as covered by employer-sponsored private health insurance. The primary cohort comprised patients with ≥1 diagnosis of sicca syndrome prior to 1 January 2013, and continued enrolment for ≥24 months (1 January 2012 to 31 December 2013). Patients with any conditions mimicking sicca symptoms not due to SS were excluded, as were those with connective tissue disease that may suggest secondary SS. The 1:1 matched comparator population comprised subjects without a previous diagnosis of sicca syndrome (sicca-free). The primary objective was to describe the clinical characteristics and demographics of patients with pSS, including the proportion of patients with glandular versus extra-glandular disease. The secondary objective was to describe their healthcare costs and resource utilisation compared with sicca-free subjects.

Results: There were 12,717 eligible patients in the primary cohort: the majority (86%) were female and the mean age was 51 years. Overall, 61% of patients had claims associated with extra-glandular disease manifestations. These patients experienced a higher disease burden with 41% reporting pain, fatigue and/or insomnia, compared with 12% of patients with glandular disease only who reported pain, fatigue and/or insomnia. Patients in the primary cohort incurred greater annual healthcare service costs (1.6 times greater for all causes and 1.5 times greater for pSS-related causes) and healthcare resource utilisation compared with the sicca-free comparator cohort. The largest difference in SS-related resource utilisation was in the number of office visits (primary cohort: 5.8 visits per patient; comparator cohort: 4.7 visits per patient). Patients with extra-glandular disease also incurred greater average annual costs and used more healthcare resources than patients with glandular disease only.

Conclusions: Despite treatment, patients with pSS still experience a high disease burden. Here we have provided novel insights into the higher treatment cost and increased healthcare utilisation burden of pSS compared with the sicca-free cohort, in particular for patients with extra-glandular disease manifestations.

FRI0764-HPR MORTALITY IN PATIENTS WITH RHEUMATOID ARTHRITIS AND END STAGE RENAL DISEASE

S. Paudyal[1], J. Waller[2], A. Oliver[3], B. Le[3], N. Zleik[3], N.S. Nahman[3,4], L. Carbone[3,4]. *[1]Internal Medicine, School of Medicine, University of South Carolina, Columbia; [2]Biostatistics; [3]Medical College of Georgia, Augusta University; [4]Charlie Norwood Veterans Affairs Medical Center, Augusta, United States*

Background: Cardiovascular related mortality is higher in patients with rheumatoid arthritis (RA) compared to the general population, and accounts for more than half of all deaths in end stage renal disease (ESRD). The prevalence of ESRD is increasing and there are an increasing number of older patients with RA. Our recent study demonstrated approximately 1% of patients with ESRD have RA. The implications of ESRD on RA relative to the burdens of cardiovascular diseases, cardiovascular and all-cause mortality are not known.
Objectives: To determine whether patients with RA who have ESRD are at increased risk for cardiovascular disease (CVD) events, cardiovascular mortality and all-cause mortality compared to the general population of patients with ESRD.
Methods: Retrospective cohort study of adult patients (age 18 and older) with ESRD receiving renal replacement therapy (hemodialysis or peritoneal dialysis) in the United States Renal Data System (USRDS) who initiated dialysis between 2005 and 2008 followed for up to five years. Patients with an ICD-9 diagnostic code for RA on or before the start of dialysis and a 5% random sample of those without RA were included. Incident cardiovascular events, cardiovascular related mortality and all-cause mortality was determined in those with RA compared to those without RA.
Results: There were 2,824 subjects including 407 with RA and 2,417 without RA included in the analyses. There was no significant difference in the total number of incident CVD events by RA status (n=311 (76.4% RA) vs. n=1936 (80.1% without RA) (p=0.09). 76 patients with RA (18.7%) died from a CVD related cause compared to 403 without RA (16.7%), (p=0.32). Overall mortality was significantly higher in those with RA (n=226 (55.5%) vs. n=970 (40.1%) ($p<0.01$). Compared to those without RA, those with RA had a significantly shorter mean time in months from start of dialysis to any incident CVD event (17.5 (12.4)) vs. 21.2 (14.1) ($p<0.01$), CVD death, (34.2 (12.5) vs.37.9 (12.6) p=0.02), or all-cause mortality (33.1 (13.0) vs. 37.8 (12.6) ($p<0.01$). In final adjusted models, RA was associated with an increased risk for both CVD related mortality (aHR=1.23 (95% CI 1.05–1.43)) and all-cause mortality (aHR=1.22 (1.05 – 1.42) within five years. Risk factors for CVD and overall mortality included older age, a higher Charlson comorbidity index, tobacco use, needing assistance with ADLs and living in a nursing home. Black race and Hispanic ethnicity was associated with significantly less CVD and all cause-related mortality.
Conclusions: Physicians treating patients with RA and ESRD should be aware that these patients are at increased risk for cardiovascular related mortality and all-cause mortality compared with the general population of ESRD patients. Patients with ESRD and RA at higher risk for mortality can be identified by both demographic risk factors as well as overall health status.

FRI0765-HPR PREVALANCE OF SARCOPENIA IN ELDERLY WITH OSTEOARTHRITIS OF LARGE JOINTS

Y. Safonova[1], V. Tsurko[2]. *[1]Northwestern State Medical University named after II Mechnikov, Department of gerontology, Geriatrics and Nursing, St. Petersburg; [2]First Moscow State University named after IM Setchenov Department of Hematology and Geriatrics, Moscow, Russian Federation*

Background: Lean muscle mass and strength decline starting approximately at 40 years of age to become 25% of body weight at 75–80 years old [1]. Within the existing literature, sarcopenia is a highly prevalent condition in older people. The prevalence of sarcopenia increases considerably with age ranging from 5% to 13% in 60 to 70 years, from 11% to 50% for the population aged 80 years and older. In older persons, sarcopenia is related to falls and physical disability leading to reduced quality of life [2]. The prevalence of osteoarthritis increases with age so that 30 to 50% of adults over the age of 65 years suffer from this condition [3]. Age-related factor that contributes includes to the development of OA include a decline in muscle strength. People with lower extremity OA had a two to five times increased incidence of falls than age-matched healthy controls [4].
Objectives: Conduct analysis of condition of muscle strength and muscle functioning in older persons with osteoarthritis.
Methods: Prospective study of 159 patients aged 74±13,3 years was held. Condition of sarcopenia was estimated by lean body mass (LBM) in accordance with criteria of sarcopenia EWGSOP. Muscle strength was estimated by a hand dynamometer and muscle functioning was estimated on the basis of SPPB tests. Amount of pain was estimated by VAS.
Results: Sarcopenia was revealed in 31,45% of older persons with osteoarthritis. Cases of falls were observed in 28,30% (95% CI 21,5 - 36,0) in patients with osteoartritis with sarcopenia (average number of falls – 1,93) and in 16,98% of patients without sarcopenia (95% CI 11,5 – 23,7) (average number of falls – 0,48). Level of pain in patients with osteoartritis with sarcopenia amounted 3,16 points, in patients without sarcopenia – 3,49 points ($p>0,05$). Muscle strength in patients with sarcopenia was 14,36 kg, in patients without sarcopenia was significantly higher – 18,53 kg ($p<0,05$). Common point of SPPB tests in patients with sarcopenia was 6,9, in patients without sarcopenia significantly higher – 7,85 ($p<0,05$).
Conclusions: Patients with sarcopenia in the presence of osteoarthritis were observed to have significant decrease of muscle strength and muscle functioning, increase of frequency of falls which raises risk of repeated falls and their frequency, and consequently, deteriorates condition of musculoskeletal system in older persons.

HPR professional education, training and competencies

FRI0766-HPR DOWN'S ARTHROPATHY - CLINICAL AND RADIOLOGICAL FEATURES OF ARTHRITIS IN CHILDREN WITH TRISOMY 21

C. Foley, E.J. MacDermott, O.G. Killeen. *OLCHC, Dublin, Ireland*

Background: Down's Arthropathy (DA) was first reported in the literature in 1984. Crude estimates suggest higher incidence and prevalence rates of DA compared with Juvenile Idiopathic Arthritis (JIA), (JIA prevalence 1/1000, estimated DA prevalence 8.7/1000). Despite this fact, there remains a paucity of data on this condition. DA is rarely recognised at onset, & remains under-diagnosed. As a direct consequence children with DA are presenting with significant joint damage and disability at diagnosis.
Objectives: Perform a musculoskeletal examination on children with Trisomy 21 (T21) aged 0–20 years
Methods: Children with T21 were invited to attend a screening clinic. Screening involved completion of a health questionnaire & a comprehensive musculoskeletal examination. DA cases detected were investigated & managed as per normal clinical practice. Data on a convenience sample of 33 newly diagnosed children with JIA was collected to create a comparison group.
Results: 503 children with T21 have been screened for DA, 22 new cases have been diagnosed. All of these children had poor language skills or were non-verbal. Only 11% of the parents suspected that their child may have arthritis prior to attending our screening clinics, and this was only after reading our recruitment literature. In total, we now have 33 children attending our centre with DA (combining cases attending pre-dating the start date of the study). This suggests the prevalence of DA in Ireland is 18–21/1000.
The majority of children presented with a polyarticular pattern of disease. No cases of uveitis have been observed to date. 88% of the DA cohort had small joint involvement of the hands, significantly higher than that observed in the JIA comparison group. Erosive changes were reported on X-Ray in 29.2% of the DA cohort (9.5% in the JIA Cohort). Methotrexate-associated nausea was a significant barrier to treatment with this DMARD in DA. There was a significant delay in diagnosis of DA, 1.7 years v 0.7 years in the JIA cohort.
Conclusions: Children with T21 are at increased risk of developing arthritis. There is a lack of awareness of this risk among health care professionals & the general public at large. This almost certainly contributes to poor recognition of the disease and a delay in diagnosis. The predominant pattern of disease is polyarticular small joint arthritis. Treatment with standard protocols used in JIA

is complicated by drug-associated side effects in children with T21. However, a good response to treatment with steroid intra-articular joint injections has been observed. Our study has raised a number of questions. Future research to accurately define this disease & identify best practice with regards to treatment would be invaluable. We advocate that all children with T21 should have annual musculoskeletal examination as part of their health surveillance programme.

FRI0767-HPR PARTICIPATING IN A MUSCULOSKELETAL RANDOMISED CONTROLLED TRIAL: IDENTIFICATION OF EDUCATION TRAINING NEEDS BY OCCUPATIONAL THERAPISTS AND PHYSIOTHERAPISTS IN THE UK

J. Adams[1,2], P. Barratt[2], S. Bradley[3], S. Barbosa-Bouças[4], K. Hislop Lennie[5], P. White[2] on behalf of OTTER II Trial working group. *[1]Arthritis Research UK, Centre of Excellence Sport, Ex & OA; [2]Faculty of Health Sciences, University of Southampton, Southampton; [3]Occupational Therapy, Poole General Hospital, Poole; [4]Department of Psychology, Buckinghamshire New University, High Wycombe; [5]Health Sciences, University of Southampton, Southampton, United Kingdom*

Background: There is an association between clinical teams engaging with research and improvement in the delivery of health services[1]. Randomised controlled trials (RCTs) provide strong evidence to influence practice in musculoskeletal services. For occupational therapists (OTs) and physiotherapists (PTs) implementing RCTs is not yet commonplace. As part of a multi-centred clinical effectiveness and efficacy RCT of splints for thumb base osteoarthritis (OTTER II Trial) we established an education training programme to support clinical therapists deliver the trial across 15 UK hospitals.

Objectives: To evaluate the content of trial training to educate and support OTTER II Trial clinicians in undertaking clinical research roles.

Methods: Two trial training days were run in the North and South of England. Therapists provided details of their clinical trial experience. They were asked to identify one area in which they felt confident and one in which they were not confident in participating in a RCT. These perceived facilitators and barriers were summarised using descriptive statistics and content analysis.

Results: Thirty five clinicians (20 OTs,15 PTs) attended a training day, 13 (37%) had no previous experience with clinical trials; 19 (54%) had been involved with at least one previous clinical trial. Clinicians considered they were already confident in; delivering the trial standardised assessment and treatment to patients n=21 (60%); trusting the OTTER II trial team and their own hospital research departments to support their research role n=11 (31%); understanding the trial protocol and what needed to be delivered n=6 (17%) and, being convinced that the trial asked a relevant question 3 (9%). Areas in which clinicians considered they did not have confidence included; the logistics and time management of delivering a RCT in their own hospital n=18 (51%); the associated trial paperwork to be completed n=8 (23%); NHS computer access/wifi access for randomisation procedure n=7 (20%); recruiting participants to time and target n=6 (17%) and staff capacity to deliver a RCT in the NHS alongside clinical commitments n=5 (14%).

Conclusions: Well documented trial protocols and support from a trusted research team and local hospital research departments were identified as key areas that help clinicians become confident to engage with a national clinical RCT. Clinicians are less confident about managing the practical logistics, staff time and trial paperwork involved in delivering a national RCT. Clinicians identify that they possess core clinical assessment and treatment skills that already equip them to recruit and treat patients as part of a national trial. The logistics of delivering a trial requires ongoing negotiation and support from clinical service managers and the clinical trial teams to ensure clinicians are supported to deliver the RCT to time and target.

FRI0768-HPR MUSCLE WASTING IN OSTEOARTHRITIS MODEL INDUCED BY ANTERIOR CRUCIATE LIGAMENT TRANSECTION

J.M.D.S. Silva, P.V.G. Alabarse, V.D.O.N. Teixeira, E.C. Freitas, F.H. de Oliveira, R.M.D.S. Chakr, R.M. Xavier. *Faculdade de Medicina, UFRGS, Porto Alegre, Brazil*

Background: Osteoarthritis (OA) is a chronic joint disease characterized by progressive loss of articular cartilage and abnormal bone formation. Furthermore, there are changes in periarticular muscles, such as loss of muscle mass, strength and function. These features may contribute to functional impairment among patients.

Objectives: This study aimed to investigate the molecular pathways involved in muscle wasting in an animal model of OA induced by anterior cruciate ligament (ACL) transection in rats.

Methods: Female Wistar rats were allocated into two groups: OA (submitted to the ACL transection; n=9) and SHAM (submitted to surgical procedures without ACL transection; n=8) [1]. Spontaneous exploratory locomotion, nociception and body weight of animals were evaluated weekly. Twelve weeks after the disease induction, animals were euthanized and the right knee joints were collected for further confirmation of the disease by histopathology, accordingly to OARSI histologic scoring system [2]. Gastrocnemius muscle from the right hind paw were dissected and weighed. Gastrocnemius was used for evaluation of muscle atrophy [3] and protein expression of myostatin, MuRF-1, MyoD and myogenin. Data were compared by Student's t test or ANOVA followed by Tukey's test or ANOVA followed by Mann–Whitney's U-test. The results are expressed as mean values ± standard deviation (SD) for symmetric variables and as medians with interquartile range for asymmetric variables. Significance was accepted at $P<0.05$.

Results: Histopathology of the right knee joints confirmed the development of the disease in animals from OA group. Gastrocnemius area of animals from OA group had a reduction of about 10% compared to animals from SHAM group. Protein expression of myostatin was increased in OA group, while myogenin expression was decreased. MuRF-1 and MyoD expression was similar in both OA and SHAM groups. Spontaneous exploratory locomotion, nociception, body weight and weight of gastrocnemius showed no difference between OA and SHAM groups.

Conclusions: Gastrocnemius atrophy in OA induced by ACL transection involves increased protein expression of myostatin and decreased protein expression of myogenin. In this model, muscle wasting may be linked to myostatin-induced deficits in satellite-cell differentiation due to decreased expression of myogenin.

FRI0769-HPR EVALUATION OF THE EFFECTIVENESS OF DEEP WATER RUNNING FOR THE TREATMENT OF CHRONIC NONSPECIFIC LOW BACK PAIN

J.S. Arakaki, F.M. Jennings, S.R. Toffolo, J.C. Tamashiro, J. Natour. *Rheumatology, Universidade federal de São Paulo- UNIFESP, São Paulo, Brazil*

Background: Low back pain (LBP) is one of the most common musculoskeletal conditions and can lead to disability. Aerobic fitness exercises have recently been suggested as important in the management of pain and physical disability of LBP patients, but there are still no studies that prove the best exercise modality for this condition. One proposed modality is the Deep Water Running (DWR) which are aquatic conditioning exercises that simulates normal running on soil.

Objectives: To evaluate the effectiveness of Deep Water Running in the treatment of chronic nonspecific low back pain.

Methods: It was a randomized controlled trial with a duration of 16 weeks with evaluations performed before the intervention and 8 and 16 weeks after the beginning of the training. The population was composed of 60 patients aged over 18 years with diagnosis of chronic nonspecific low back pain. The intervention group performed aerobic conditioning exercise (Deep Water Running) in a heated pool. The sessions had duration of 50 minutes and frequency of 3 times a week for 16 weeks and with 70% of the maximum heart rate, with 10 bpm less for the difference in the behavior of HR in aquatic environment. The control group underwent aerobic conditioning by treadmill exercise for 50 minutes, 3 times a week for 16 weeks, and also with 70% of maximal heart rate. *Evaluation instruments:* Visual analog pain scale (EVA) in cm; Likert Scale of pain improvement and worsening according to the patient and according to the evaluator; Functional capacity through the Roland-Morris questionnaire and 6-minute walk test; SF-36 for general quality of life; And amount of anti-inflammatories used during the study period. Evaluations were performed by an evaluator who was unaware of the patient allocation group.

Results: The two groups were homogeneous regarding most clinical demographic characteristics in the initial evaluation. The two groups showed statistically significant improvement in the variables Roland Morris, EVA for pain and Time up and go, but no statistically significant differences were found between groups. At the Likert scale, the 6-minute walk test and the amount of anti-inflammatories used during the study, no significant differences were found, the two groups remained unchanged. No adverse events were observed in either group during the exercise program.

Conclusions: Deep water running aerobic exercise is as effective as treadmill walking in improving pain and functional capacity in patients with chronic nonspecific low back pain.

FRI0770-HPR A BETTER WAY TO DECREASE KNEE SWELLING IN PATIENTS WITH KNEE OSTEOARTHRITIS: INTERMITTENT PNEUMATIC COMPRESSION – A RANDOMIZED CONTROLLED CLINICAL TRIAL

Z. Sarı, O. Aydoğdu, I. Demirbüken, U.S. Yurdalan, G.M. Polat. *Physiotherapy and Rehabilitation, Marmara University, Health Sciences Faculty, Istanbul, Turkey*

Background: One of the most common symptoms of knee OA is swelling. Knee swelling negatively affects knee mechanics and muscle activity in patients with OA. Thus, knee swelling should be eliminated in the early period of rehabilitation. The utility of cold therapy for musculoskeletal injuries has been clearly established (1). It was shown that cold therapy may not be a statistically effective modality in improving range of motion and decreasing knee swelling (2).
Intermittent pneumatic compression (IPC), which has been used to treat limb swelling, is a common option for patients with lymphedema and venous leg ulcers. Currently, IPC is primarily used in the prevention of deep venous thrombosis. It is also used for venous insufficiency, arterial occlusive disease, prevention of hematoma, etc (3). However, despite its widely accepted use, the literature on IPC in musculoskeletal injuries is limited. In particular, there is no report on whether IPC, which is known to have positive effects on circulatory problems, affects the knee swelling in OA.
Objectives: In this study, we hypothesized that IPC may have better outcomes on knee swelling. We also investigated whether IPC may contribute to better short-term patient outcomes in patients with knee OA rather than cold therapy.
Methods: This was a randomized, prospective, comparative clinical study. The study included 81 patients aged 18–65, who were admitted to the Or – Ahayim Balat Hospital. The patients were randomly divided into two groups. One group (n=36) received ultrasound, transcutaneous electrical nerve stimulation, electrical stimulation, exercise, and cold packs. The second group (n=45) received ultrasound, transcutaneous electrical nerve stimulation, electrical stimulation, exercise, and IPC. The primary outcome on pre- and post – treatment follow – up was knee swelling. Secondary outcome measures included range of motion, muscle strength, pain intensity and disability.
Results: Intermittent pneumatic compression significantly decreased knee swelling in patients with osteoarthritis ($p<0.001$). A significant difference between the groups was found in knee swelling in favour of the intermittent pneumatic compression group (p=0.028). We also found significant improvements in range of motion, muscle strength, pain intensity and disability in both groups ($p<0.05$). No significant differences in any of secondary outcome variables between the groups ($p>0.05$).
Conclusions: The mechanism of our hypothesis was that in opposite of cold therapy which has local effects, IPC may affect circulatory of all lower extremity in patients with swollen knee. This randomized - controlled trial confirmed the hypothesized advantage of intermittent pneumatic compression over cold - pack on knee swelling in patients with knee osteoarthritis.

FRI0771-HPR WORK – RELATED LUMBAR PAIN IN PHYSIOTHERAPISTS WHO WORK IN DIFFERENT FIELDS – A PILOT STUDY

B. Karakoç, Z. Sarı, O. Aydoğdu, U.S. Yurdalan. *Physiotherapy and Rehabilitation, Marmara University, Health Sciences Faculty, Istanbul, Turkey*

Background: Having a job exposing the load on the lumbar region increases lumbar pain risk. Lumbar pain takes first place in musculoskeletal disorders among health care workers. A survey which investigated musculoskeletal disorders in physiotherapists indicated that the most common musculoskeletal disorders have seen in the lumbar region.
Objectives: The aim of this study was to determine the work – related lumbar pain in physiotherapists who work in different fields and differences in terms of occupational and personal variables.
Methods: This was a prospective, comparative and multi – central study. Physiotherapists who accepted to participate in this study voluntarily and work at any of paediatric, orthopaedic and neurological fields were received. Eighty – eight physiotherapists were taken first assessment. Their demographic information were taken and they filled out the Oswestry Low Back Disability Questionnaire. Twenty – nine cases who had any orthopaedic disease, surgical history and did not fill the entire of the Oswestry Low Back Disability Questionnaire excluded from the study. Twenty – eight women and 31 men met the criteria for inclusion.
Physiotherapists were divided into three groups as paediatric (n=21), orthopaedic (n=24) and neurological (n=14). Lumbar pain level, the number of daily patient transfer, daily working hours and daily standing working hours in three groups were compared. One – way ANOVA was used to compare the groups. SPSS v11.5 was used for the statistical analysis.
Results: There were no significant differences in lumbar pain levels between groups (p=0.342). Daily standing working hours of paediatric group were significantly less than orthopaedic group (p=0.021) and the number of daily patient transfer were significantly higher in paediatric group according to orthopaedic group (p=0.028). Daily standing working hours and the number of daily patient transfer of neurological group had no differences between other groups (p=0.173).
Conclusions: We think that the reason why no differences between the pain level of paediatric and orthopaedic group may be due to more daily transfers in paediatric group and more daily standing working hours in orthopaedic group. The cause why no differences between neurological field and others, might be because of another working factors which we did not assessed. There is a need for research examining in detail on working conditions and trials including more cases.

FRI0772-HPR FORMAL RHEUMATOLOGY TRAINING FOR GENERAL PRACTITIONERS

S. Khan [1], A. Mohammad [1], K.P. O'Rourke [1], C. Sheeehy [2]. *[1]Rheumatology, Rheumatology, Midland Regional Hospital, Tullamore, Tullamore; [2]Rheumatology, University Hospital Waterford, Waterford, Ireland*

Background: Formal post graduate training in rheumatology is limited for primary care physicians or general practitioners. General practitioners (GPs) have extraordinary wide knowledge base, and deal with all age groups, from minor ailments to serious illnesses, thus it's not possible to expect them to have a strong hold of specialised conditions like inflammatory arthritis (IA) (2). General practitioners can be trained to manage these conditions in order to break the disconnect between the flow of knowledge and the burden of care in rheumatic conditions.
Objectives: The Rheumatology department in Midlands Regional Hospital and University Hospital Waterford facilitates GPs teaching in rheumatology outpatients clinics. Every year six GP trainees are trained by consultant rheumatologist. Each trainee receives one on one education in managing rheumatologic conditions including joints and soft tissue injections. This survey was done to evaluate whether GP trainees benefited from it in diagnosing and treating rheumatologic diseases when compared to non rheumatology trainees.
Methods: This is a cross sectional study of a convenience cohort. GP trainees who received rheumatology training as part of their hospital rotation were included as "cases", and compared to those who didn't have any formal rheumatology exposure during their training g as "control". The cases attended supervised rheumatology outpatients for one year, and. A questionnaire was emailed as well as distributed to the GP trainees, it included questions on trainees' ability and comfort level in diagnosing, assessing and managing inflammatory and non inflammatory conditions, along with joint and soft tissue injections.
Results: There were 60 participants in the study, 30 cases and controls each. Majority (94%) didn't have formal rheumatology teaching in the medical school, but had rheumatology experience post graduation, 30 being GP trainee in rheumatology and 7 as senior house officers attached to rheumatology team. The GP trainees had an average of 7 months exposure to rheumatology. The GP trainees who attended the rheumatology clinics were confident in: examining joints, differentiating musculoskeletal/ mechanical from inflammatory conditions, educating patients and commencing them on DMARDs, interpreting serological tests (RF, CCP, ANA etc), managing osteoarthritis, tennis elbow, and soft tissue and intra-articular Knee and shoulder injections, as compared to the trainees who didn't have any formal rheumatology training ($P<0.001$).
Conclusions: Rheumatology teaching for the GP trainees is certainly beneficial, and helps them in managing rheumatologic conditions in primary care settings.

HPR patients' perspectives, functioning and health (descriptive: qualitative or quantitative)

SAT0717-HPR **PREGNANCY AND DELIVERY IN PATIENTS WITH RHEUMATOID ARTHRITIS AND SPONDYLOARTHRITIS**

A. Zbinden[1], S. van den Brandt[2], P.M. Villiger[1], M. Østensen[1], F. Förger[1].
[1]Department of Rheumatology, Immunology and Allergology, Inselspital, University of Bern, Berne, Switzerland; [2]Academic Medical Center, University of Amsterdam, Amsterdam, Netherlands

Background: Inflammatory rheumatic disease do have an influence on pregnancy course and outcome. There is little knowledge about the comparison between two rheumatic diseases.
Objectives: To analyze pregnancy complications, pregnancy outcome and delivery mode in patients with rheumatoid arthritis (RA) and spondyloarthritis (SpA).
Methods: Patients with RA and SpA were compared with those of matched healthy controls (HC) with respect to pregnancy complications, pregnancy outcome and delivery mode. Patients and controls were prospectively followed at the University of Bern.
Results: We analyzed 244 pregnancies, of which 96 pregnancies occurred in 86 RA patients, 78 in 70 SpA patients and 70 in 70 healthy women.
Pregnancy complications (gestational diabetes, preeclampsia, infection, premature rupture of membranes) were more frequent in RA patients (11.5%) and in SpA patients (17.9%) than in HC (1.4%).
Pregnancy outcome of 174 pregnancies in RA and SpA patients resulted in 178 live born infants, 6 sets of twins, one stillbirth and one induced fetal demise. The induced fetal demise was performed in a twin pregnancy on a fetus with a congenital anomaly. Congenital anomalies occurred in 6 infants (3 in RA and 3 in SpA patients). All HC had live births. Median birth weight was lower in patients compared with HC (RA: 3100g, SpA: 3245g, HC: 3455g). RA and SpA patients had more often small for gestational age infants (birth weight <10th percentile; RA: 16.2%, SpA: 11.4%, HC: 1.4%) and preterm deliveries (RA: 18.8%, SpA: 11.5%, HC: 1.4%).
With regard to delivery mode, most women had vaginal deliveries (RA: 51.0%, SpA: 57.7%, HC: 72.9%). Birth by caesarean section (elective and emergency), was more frequent in RA and SpA patients than in the healthy controls (RA: 44.8%, SpA: 39.7%, HC: 27.2%). Emergency caesarean sections were indicated in 22.9% of pregnancies among RA patients, in 21.8% of SpA patients and in 14.3% of healthy women.
Conclusions: Pregnancy complications, caesarean section, and adverse child outcomes were more frequent in patients with RA and SpA compared to healthy women. However, no significant differences in pregnancy outcomes were observed between RA and SpA patients indicating comparable risks induced by the autoimmune inflammatory process.

HPR measuring health (development and measurement properties of PROs, tests, devices)

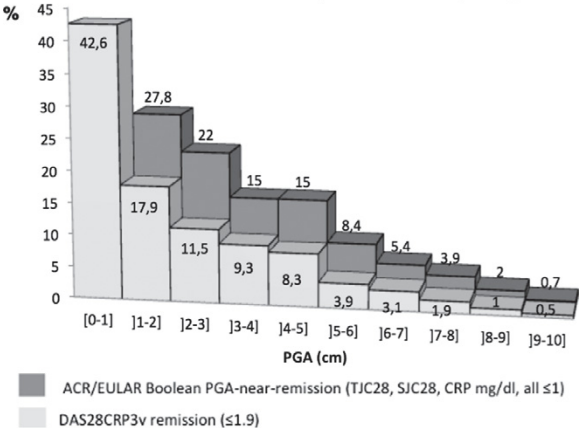
SAT0718-HPR **INFLUENCE OF PATIENT GLOBAL ASSESSMENT ON THE DISEASE ACTIVITY ASSESSMENT IN PATIENTS WITH RHEUMATOID ARTHRITIS: A METEOR CROSS-SECTIONAL STUDY**

R.J.O. Ferreira[1], M. Ndosi[2], C. Duarte[1], P. Carvalho[1], A. Chopra[3], K. Salomon-Escoto[4], D. Vega[5], D. van der Heijde[6], P. Machado[7], J.A.P. da Silva[1] on behalf of METEOR investigators. *[1]CHUC, Coimbra, Portugal; [2]UWE, Bristol, United Kingdom; [3]CRD, Pune, India; [4]UMMMC, Worcester, United States; [5]HU/UANL, Monterrey, Mexico; [6]LUMC, Leiden, Netherlands; [7]UCL, London, United Kingdom*

Background: Disease activity indices (DAI) are used to guide immunosuppressive therapy in rheumatoid arthritis (RA). The inclusion of patient global assessment (PGA) in these indices has been questioned as it conveys mainly disease impact rather than disease activity.
Objectives: To determine the influence of PGA on patient disease states and to determine PGA correlations with inflammatory parameters, disease impact, demographic, clinical and contextual factors.
Methods: The METEOR international database was used, namely data from patients' first available visit with no missing values on PGA, tender and swollen joint counts (TJC28, SJC28) and C-reactive protein (CRP). Remission rates were compared according to the DAS28CRP3v vs 4v and ACR/EULAR Boolean remission vs near-remission (failing 1 of the 4 criteria) definition. We assessed the correlation of PGA with (predominantly) inflammatory (TJC28, SJC28, CRP) and disease impact (pain and HAQ) factors. We used hierarchical modelling to explain PGA by 4 blocks (B) of independent variables (B1: gender, age, disease duration; B2: biologic DMARD, Gross National Income; B3: pain, HAQ; and B4: TJC28, SJC28, CRP).
Results: Among the 18280 patients analysed, 1930 (10.6%) were in DAS28CRP4v remission, and 2197 (12.0%) in DAS28CRP3v remission. According to the Boolean definition, 1207 (6.6%) patients were in remission. PGA was the main obstacle to Boolean remission: 2090 (79.0%) of the 2645 near-remission patients (Table 1). A considerable proportion of patients with low inflammation perceived high PGA (Figure 1).
PGA correlated better with Pain (r_p=.79) and HAQ (r_p=.55) than with TJC28 (r_p=.45), SJC28 (r_p=.36) or CRP (r_p=.25).
In the entire dataset, 60.2% of PGA variance was explained by Pain and HAQ, 1.8% by B1 and B2 of covariates and only 1.3% by B4 (TJC28, SJC28, CRP) (Table 2). In near-remission patients, B4 did not contribute significantly to changes in the model.

Table 1. Remission and near-remission rates (n=18280)

Disease Activity	3v	4v
DAS28CRP#, n (%)		
Remission (≤1.9)	2197 (12.0)	1930 (10.6)
Low (≤2.2)	3855 (21.1)	3485 (19.1)
Moderate to High (>2.2)	1228 (66.9)	12865 (70.3)
ACR/EULAR Boolean, n (%)		
Remission	1207 (6.6)	
Near-rem. PGA	2090 (11.4)	
Near-rem. CRP	214 (1.2)	
Near-rem. SJC28	165 (0.9)	
Near-Rem. TJC28	176 (1.0)	
Non-Remission	14428 (78.9)	



#Fleischmann 2015 (PMID:25143522).

Table 2. Hierarchical multivariable regression analysis to explain PGA

Model Block	All patients (n=6388)			Patients in Near-Remission (n=831)		
	Adj. R^2	R^2 change	sig. F Change	Adj. R^2	R^2 change	sig F Change
B1	0.008	0.008	<0.001	0.015	0.018	0.002
B2	0.018	0.010	<0.001	0.024	0.012	0.007
B3	0.620	0.602	<0.001	0.423	0.398	<0.001
B4	0.633	0.013	<0.001	0.426	0.004	0.092

Legend: B1 = Gender + Age + Dis. duration; B2 = B1 + Gross Nat. Income + bDMARD; B3 = B1 + B2 + Pain + HAQ; B4 = B1 + B2 + B3 + TJC28, SJC28, CRP.

Figure 1 - PGA distribution in patients in remission by DAS28CRP3v (n=2197) and in PGA-near-remission by Boolean definition (n=2090).

Conclusions: Two thirds of patients that achieve TJC28, SJC28, and CRP≤1 still perceive high PGA despite disease "inflammatory" control. The weight of PGA in DAI could lead to immunosuppressive overtreatment. In these patients, disease impact management, including non-pharmacological treatments delivered by Health Care Professionals, are more likely to be effective.

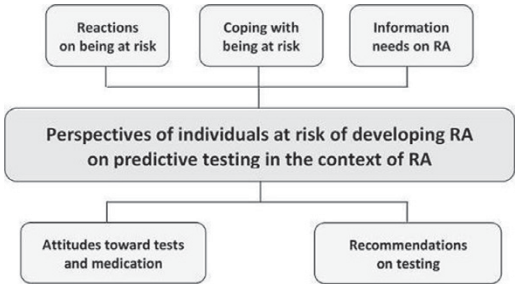
HPR patients' perspectives, functioning and health (descriptive: qualitative or quantitative)

SAT0719-HPR **"AND SUDDENLY YOU ARE A PERSON AT RISK OF DEVELOPING RHEUMATOID ARTHRITIS!" DIFFERENT PERSPECTIVES OF INDIVIDUALS ON PREDICTIVE TESTING – RESULTS OF AN INTERNATIONAL QUALITATIVE INTERVIEW STUDY**

E. Mosor[1,2], M. Stoffer[2], G. Steiner[2], K. Raza[3], R.J. Stack[3], G. Simons[3], M. Falahee[3], G. Schett[4], A. Hueber[4], M. Engelbrecht[4], J. Smolen[2], T. Stamm[1]. *[1]Section for Outcomes Research, CeMSIIS - Center for Medical Statistics, Informatics, and Intelligent Systems, Medical University of Vienna; [2]Division of Rheumatology, Department of Internal Medicine III, Medical University of Vienna, Vienna, Austria; [3]Department of Rheumatology, University of Birmingham and Sandwell & West Birmingham Hospitals NHS Trust, Birmingham, United Kingdom; [4]Rheumatology and Immunology, Department of Internal Medicine 3, Universitätsklinikum Erlangen, Erlangen, Germany*



Background: People at risk of developing rheumatoid arthritis (RA) may be candidates for interventions aimed at preventing RA development [1]. The identification of such "at risk" populations includes testing for genetic and other (e.g. autoantibody) biomarkers. However, little is known about the people's perspectives on these tests, how they react and cope when identified as being a person "at risk" and what their unmet needs are.

Objectives: To expore the perceptions about RA and predictive testing and to understand the various reactions and coping strategies used when identified as being at risk of developing RA from the perspective of those directly concerned.

Methods: As part of the EuroTEAM project, a qualitative interview study with people who were informed of being at risk of developing RA was conducted. An interview schedule was developed and pilot-tested. Interviews were audio-recorded, transcribed verbatim and analyzed using thematic analysis.

Results: A total of 34 individuals (with rheumatoid factor and/or ACPA positive) already informed of being at risk of developing RA participated in the study, from Austria (n=15), Germany (n=15), and the UK (n=4). In Vienna, people who had been tested within an expanded health exam participated in this study. In Birmingham and Erlangen, people with arthralgia were recruited from the outpatient clinics. Analysis of the interview data revealed five overarching themes related to predictive testing in the context of RA (Figure).

There were differences between the perceptions of althralgia patients and asymptomatic individuals. People suffering from pain were much more frightened and worried when informed of being at risk of developing RA. As a consequence, they modified their lives in a larger extent and had greater knowledge about RA than those without any symptoms who were rather surprised, kept calm and hardly changed their lifestyle after being tested positive. Allmost all participants in this study would appreciate precise predictive tests in the context of RA. However, more than half of them would refuse synovial biopsy (even if this could help quantify risk more accurately) or preventive medication. Recommendations for an improved procedure of predictive testing in the field of RA were given, which could promote uptake of preventive strategies.

Conclusions: Participants showed large differences in views about predictive testing in the context of RA risk and offered specific suggestions that should be incorporated into service design and delivery in the context of future predictive testing programmes. These findings may also be relevant to prediction and prevention in the context of other diseases where multiple genetic risk factors interact with environmental risk factors to drive disease development.

SAT0720-HPR **LONGITUDINAL ANALYSIS OF RESPONSE, COSTS AND RESOURCE USE OF PATIENTS WITH RHEUMATOID ARTHRITIS INITIATING BIOLOGIC DISEASE-MODIFYING ANTIRHEUMATIC DRUGS (BDMARDS) IN TAIWAN USING THE NATIONAL HEALTH INSURANCE RESEARCH DATABASE**

Q. Shi[1], T. Treuer[2], B.C. Wang[3], C.L. Gaich[4], C.-H. Lee[5], W.-S. Wu[5], W. Furnback[3], K.-J. Li[6], C.-H. Tang[7]. *[1]Eli Lilly & Co., Shanghai, China; [2]Eli Lilly & Co., Budapest, Hungary; [3]Elysia Group Ltd., Taipei, Taiwan, Province of China; [4]Eli Lilly & Co., Indianapolis, United States; [5]Eli Lilly & Co; [6]National Taiwan University; [7]Taipei Medical University, Taipei, Taiwan, Province of China*

Background: Rheumatoid arthritis (RA) is an inflammatory disorder associated with a significant physical and psychological burden. Patients with RA experience a lower quality of life than patients without RA. This study utilizes Taiwan's National Health Insurance Database (NHIRD) which is a claims-based database recording all interactions with the National Health Insurance (NHI) system.

Objectives: The objective of this study was to use the NHIRD to estimate the percentage of newly treated patients with inadequate response (IR) to biologic disease-modifying antirheumatic drugs (bDMARDs) as well as the costs and resources.

Methods: Data were from the catastrophic illness file within the NHIRD from 1/1/2009 to 12/31/2013. The index period spanned 2010 with a pre-index period consisting of the index date – 365 days, and patient follow-up was index date to 365 days post-index. Patients with a catastrophic illness card for RA were included in the study. Biologically-naïve patients included those who did not have a claim for a bDMARD or exclusion diagnoses in the pre-index period. Biologically-naïve patients with a bDMARD claim were indexed upon their first claim for a bDMARD during the index year. A validated algorithm was used to examine the rate of inadequate response in the biologically-naïve cohort of patients. Inadequate responders met one or more of the following criteria during their year of follow-up: low adherence (proportion of days covered <0.80); switched to or added a second bDMARD; added a new conventional synthetic DMARD (csDMARD); received ≥ 1 glucocorticoid injection; or increased oral glucocorticoid dosing. All-cause mean annual direct costs and resource use were measured in the year of follow-up. Costs were converted from NT$ to EUR using 1 NT$ =0.03 EUR.

Results: A total of 818 biologically-naïve patients initiated a bDMARD and were included in the study. At 1 year of follow-up, 66.01% (n=540) were classified as bDMARD-IR, 31.54% (n=258) were classified as confirmed stable, and 2.44% (n=20) were of unknown response status. Mean annual total direct costs in the follow-up year were €14,669 and €12,867 for the confirmed stable and inadequate responder cohorts, respectively. Mean annual non-medication costs were 40.4% (€578) higher for the IR cohort, and mean annual medication costs were 17.2% (€2,379) higher for the confirmed stable cohort. IR patients had higher mean annual resource utilization in the follow-up year with increases in hospital admissions (0.46 vs. 0.1), hospital days (3.4 vs. 0.49), outpatient visits (42.50 vs. 37.66), and emergency department visits (0.51 vs. 0.3).

Conclusions: A significant proportion of patients with RA initiating a bDMARD for the first time showed an IR to their treatment within a year. Patients with an IR had increased resource utilization and higher non-medication costs than those with stable disease. This level of IR suggests an unmet need in the RA treatment paradigm.

SAT0721-HPR **EXPOSURE TO PASSIVE SMOKING AND RA RISK; RESULTS FROM THE SWEDISH EIRA STUDY**

A.K. Hedström[1], L. Klareskog[2], L. Alfredsson[1]. *[1]Institute of Environmental Medicine; [2]Department of Medicine, Karolinska Institutet, Stockholm, Sweden*

Background: Smoking has consistently been associated with increased risk of developing rheumatoid arthritis (RA). However, no studies have been performed investigating the effect of exposure to environmental tobacco smoke (i.e. passive smoking) on RA risk.

Objectives: The aim of this study was to estimate the influence of passive smoking on the risk of developing the two major subsets of RA, defined by anti-citrullinated protein antibodies (ACPA) status.

Methods: A population-based case-control study using incident cases of RA was performed in Sweden, and the study population in this report was restricted to include never smokers (589 cases, 1764 controls). The incidence of RA among never smokers who had been exposed to passive smoking was compared with that of never smokers who had never been exposed, by calculating the odds ratio with a 95% confidence interval employing logistic regression.
Results: No association was observed between exposure to passive smoking and RA risk (OR 1.0, 95% CI 0.8–1.2 for ACPA positive RA, and OR 0.9, 95% CI 0.7–1.2 for ACPA negative RA). No suggestion of a trend between duration of passive smoking and RA risk was observed.
Conclusions: No association was observed between exposure to passive smoking and RA risk, which may be explained by a threshold below which no association between smoke exposure and RA occurs.
Acknowledgements: The EIRA study was supported by grants from the Swedish Medical Research Council, the Swedish Council for Health, Working life and Welfare, King Gustaf V:s 80-year foundation, the Swedish Rheumatism Foundation, Stockholm County Council, the insurance company AFA, the EU-supported AutoCure and BeTheCure projects, and from the COMBINE (Controlling chronic inflammatory diseases with combined efforts) project.

Background: Family history of rheumatoid arthritis (RA) is a surrogate for an individual's genetic and partly environmental risk of developing RA. It is assessed daily in clinical practice and its magnitude and pattern of distribution may provide information on the RA etiology.
Objectives: We investigated the association between family history of RA and the risk of anti-citrullinated peptide antibody (ACPA)-positive and ACPA-negative RA in the Malaysian population.
Methods: Data from the Malaysian Epidemiological Investigation of Rheumatoid Arthritis (MyEIRA) population-based case-control study involving 1,055 early RA cases and 1,055 age, sex and residential area-matched controls were analyzed. Information from interview-reported family history of RA or rheumatic stiff back among first degree relatives was used to estimate the risk of developing ACPA-positive and ACPA negative RA. The odds ratio (OR) with 95% confidence interval (CI) was calculated.
Results: In this study, 64% of the RA patients were ACPA-positive and 40% of the overall RA carried HLA-DRB1 shared epitope (SE) alleles. Family history of RA was significantly associated with an increased risk of developing RA in the Malaysian population (RA versus controls, 17.0% vs. 7.7%, OR 2.4, 95% CI 1.8–3.2, $p<0.0001$). The association between positive family history and risk of RA was uniformly observed for the ACPA-positive RA (OR 2.5, 95% CI 1.8–3.3, $p<0.0001$) and ACPA-negative RA (OR 2.3, 95% CI 1.6–3.2, $p<0.0001$) subsets, respectively. A dramatically increased risk for ACPA-positive RA was seen in individuals who both were having positive family history of RA and carried HLA-DRB1 SE alleles (OR 14.7, 95% CI 7.7–27.8). We also observed a lesser risk magnitude in the ACPA-negative RA patients (OR 5.7, 95% CI 2.7–11.9).
Conclusions: Our data demonstrate that family history of RA remains an important clinical risk factor for RA. In addition, positive family history of RA was associated with an increased risk of developing both the ACPA-positive and ACPA-negative RA in the Malaysian population, suggesting that the two RA subsets are similar in genetic risk factors that overlap with these diseases.

SAT0723-HPR GENDER DIFFERENCES IN COPING STRATEGIES AND ILLNESS ACCEPTANCE IN PATIENTS WITH INFLAMMATORY ARTHRITIS – A NATIONWIDE CROSS-SECTIONAL STUDY

B.A. Esbensen[1,2], C. Flurey[3], K.V. Jensen[1], L. Andersen[1], N.M. Hammer[1].
[1]Rigshospitalet - Glostrup, COPECARE, Centre for Rheumatology and Spine Diseases & Research Unit, Glostrup; [2]Department of Clinical Medicine, Faculty of Health and Medical, University of Copenhagen, Copenhagen, Denmark; [3]Rheumatology Unit, Bristol Royal Infirmary, West England, Bristol, United Kingdom

Background: There is an increasing focus on how patients with inflammatory arthritis (IA) manage living with arthritis. There are a preponderance of women with RA (70%), thus previous research has overall focused on female patients and their management. Research in other long term conditions suggests men need their own health strategy[1], thus it is important to investigate whether there are gender differences in coping strategies and illness acceptance within chronic IA.
Objectives: To explore gender differences in IA as reflected by coping strategies and illness acceptance. Furthermore, to identify factors associated with high degree of illness acceptance.
Methods: The study was conducted as a nationwide cross-sectional study using online survey during 2016. Patients >18 with rheumatoid arthritis (RA), psoriatic arthritis (PsA) and axial spondyloarthritis (axSpA) were invited to contribute through: The Danish Rheumatism Organization, local arthritis networks, diagnosis networks, and rheumatology departments across the country. The self-report online questionnaire comprised Socio-demographics, Diagnosis, Symptoms (pain, fatigue, global), Medications, Disease Activity, Functional Status, Coping (i.e. confrontation, avoidance and acceptance-resignation) and Illness Acceptance. As recommended by EULAR 2 patients with RA (KVJ & LA; male and female, respectively), were included as equal research partners in all phases of the study. Descriptive statistics were applied to explore gender differences, and logistic regression analyses were performed to test for factors associated with illness acceptance.
Results: In total, 664 (85% women) were included in the study; RA 53%, PsA 27% and axSpA 20%. More men (40%) than women (30%) were treated with biological DMARDS (p=0.048). No significant gender differences were found in disease activity, symptoms and functional status. Overall, the total sample had high degree of illness acceptance and no significant difference was found between males and females. Regarding illness coping, women with IA tend to use avoidance as a coping strategy significantly more than men (p=0.015). In the final multivariable regression model, higher education (OR=1.46; 1.02–2.11), longer time diagnosed (OR=1.21 per 1-yr. increase; 1.01.-1.05), lower physical disability (OR=0.76; 0.69–0.85), better coping with fatigue (OR=1.13; 1.05–1.22), less avoidance (OR=0.93; 0.87–0.99) and acceptance-resignation (OR=0.62; 0.62–0.75) as coping strategies were significantly associated with high degree of illness acceptance.
Conclusions: No significant differences were found in illness acceptance among women and men with IA. However, women tended to use avoidance as a coping strategy more than men. High levels of illness acceptance may be explained by high education, longer disease duration, and better physical function, better coping of fatigue and less use of passive coping strategies.

SAT0724-HPR GOTHENBURG NURSE LED TIGHT CONTROL STUDY – GOTNET. PATIENTS' EXPERIENCES OF NURSE-LED CARE AND TIGHT CONTROL. A QUALITATIVE STUDY OF PATIENTS WITH RHEUMATOID ARTHRITIS

U. Bergsten[1,2], A.-S. Sjö[1]. *[1]Rheumatology Department, Sahlgrenska University Hospital, Gothenburg; [2]Department of Research, Development and Education, Region Halland, Varberg, Sweden*

Background: Rheumatoid arthritis (RA) is a chronic inflammatory illness, using both pharmacological and non-pharmacological therapies. Some patients experience good treatment, knowledge about their illness and situation. For other patients, it might look different depending on how much they know about their illness. Earlier research has primary focused on patients in remission. In order to strengthen and support patients with RA that are not feeling well, to give them more knowledge about their situation, one strategy could be that they have access to a nurse-led rheumatology clinic with person-centered care (PCC).

Objectives: The aim of this study was to describe patients' experiences of nurse-led care tight control.
Methods: Qualitative design was used in order to receive deeper understanding of the phenomenon. Interviews were conducted with 12 informants (with strategic sample) that participated in the intervention group of a randomized controlled trial exploring the effect of patient centered care, the Got-Net study. The interviews were analyzed using phenomenography approach.
Results: The informants' experiences of nurse-led care tight control emerged in three categories. The three categories describe the process, the relationship between the concepts. The first step describes the *Meeting of competence*, the next step that the informant experienced was *Relationship building* and the last step to have *Made a personal journey*.
Conclusions: Patients with RA who got the opportunity of nurse-led care and tight control became strengthen, got extended knowledge about their illness. Patients have been treated on their own level, knowledge and needs, by using a person-centered approach.

HPR interventions (educational, physical, social and psychological)

SAT0725-HPR GOTHENBURG NURSE LED TIGHT CONTROL STUDY - GOTNET. A STUDY COMPARING "CARE AS USUAL" WITH NURSE LED CLINIC, TIGHT CONTROL AND PERSON CENTRED CARE IN PATIENTS WITH RHEUMATOID ARTHRITIS (RA) AND WITH MODERATE/HIGH DISEASE ACTIVITY

U. Bergsten[1,2], K. Almehed[2], L. Jacobsson[3]. [1]*Department of Research, Development and Education, Region Halland, Varberg;* [2]*Rheumatology Department, Sahlgrenska University Hospital, Gothenburg;* [3]*Department of Rheumatology a Inflammation Research, Institute of Medicine, Gothenborg, Sweden*

Background: The treatment guidelines of EULAR recommend treatment according to "tight control" (TC), clear treatment goals (Treat-to-Target, T2T) and patient involvement. Despite this, the care for patients with RA needs to be improved as demonstrated by the fact that as many as that 45% of patients with RA in Sweden (according to the Swedish Rheumatology Quality Register in 2015) do not reach the level of low disease activity. One way to overcome this could be nurse led clinics of RA patients, which for patients in remission have shown positive effects on patient's pain, knowledge and self-efficacy. We hypothesized that a nurse-led clinic based on the above principles of TC, T2T and Person-centered care would result in better outcome compared to care as usual.
Objectives: The aim of the study was to compare the effect of such nurse-led clinic with frequent visits and person-centered care with regular care of patients with established RA and a moderate to high disease activity.
Methods: This was a randomized, controlled, blinded assessor study that aimed to compare the effect of nurse-led clinic with regular care of patients with the established RA. Inclusion criteria were; duration of RA >2 yrs., DAS28>3.8, age <85 yrs. and not having experience with all available csDMARDs and bDMARDS. Patient with any severe current comorbidity were excluded. Intervention Group (IG): intervention included two elements; 1) disease activity control every 6th week, with clear treatment goals (DAS28 <2.6)and escalation of pharmacological therapy according to existing Swedish guidelines, 2) a written person-centered care health plan with shared goal setting and decision making between patient and nurse. Control Group (CG): Patients in the control group were followed by a physician once every 3 to 6 month. Evaluation was done at w 26 both per protocol (shown) and according to intention to treat (ITT) with LOCF. Primary outcome was change in DAS28 at week 26 and secondary outcome the proportions of good/moderate EULAR response. Pre study power calculations estimated group sizes to 60 patients in each group. Due to difficulties in the recruiting process the study was stopped preterm
Results: The study included 70 patients of which (IG: 36 and CG: 34) with similar baseline characteristics as a result of the randomization. Sixty-two patients completed the study at w 26 (IG: 29 and CG: 33). Both groups improved significantly in DAS 28 (Table 1). The change in DAS 28 was not significantly different between groups, although the numerical improvement was larger in the IG compared to CG (Table 1). Furthermore, significantly more patients in the IG improved according to EULAR Good or Moderate response (Table 1). Results were similar when analyzing according to ITT with LOCF.

Table 1. Primary outcome (delta DAS 28) and secondary outcome (good/moderate EULAR response)

	IG	CG	Difference (95% CI)
ΔDAS 28 (95% CI)	1.5 (-2.0,-1.0)	1.1 (-1.6,-0.6)	- 0.43 (-1.13,0.27)
EULAR Good/Moderate (%)	22/29 (76%)	16/33 (48%)	27% (3–51%)

Conclusions: This controlled trial suggest that a nurse-led clinic for RA patients with moderate/high disease activity may be effective. Although not shown, it likely to be cost-effective and possible to implement in clinical care.

HPR patients' perspectives, functioning and health (descriptive: qualitative or quantitative)

SAT0726-HPR FUNCTIONAL IMPAIRMENT IN PATIENTS WITH RA IN AN EIGHT YEAR PERSPECTIVE

A. Bremander[1,2,3], K. Forslind[4,5], K. Eberhardt[1], M. Andersson[1,3]. [1]*Department of Clinical Sciences, Section of Rheumatology, Lund University, Lund;* [2]*School of Business, Engineering and Science, Halmstad University;* [3]*Spenshult Research and Devlopment Centre, Halmstad;* [4]*Department of Clinical Sciences, Section of Rheumatology, Lund University, Lund and Helsingborg;* [5]*Department of Research and Education, Helsingborg's hospital, Helsingborg, Sweden*

Background: In people with Rheumatoid arthritis (RA) impaired physical functioning is an acute as well as long term effect of the disease. Observational performance tests reflecting range of motion in upper as well as in lower extremities should be easy to perform in the clinic as well as in research as a complement to self-reported measures of physical functioning. The Signal Of Functional Impairment (SOFI)[1] is a performance test which so far has been applied only in Sweden but commonly used in the clinic and in long term follow-up clinical studies.
Objectives: The aim was to study performance-based function assessed with SOFI over 8 years and, secondly, to study which items included in SOFI that were associated with change in functioning over time.
Methods: An inception cohort of 1 052 patients with early RA, from the BARFOT-study, recruited 1992–2006 was investigated, mean (SD) age was 54 years (14), 70% were women. The patients were followed by a structured protocol at baseline, 3 and 6 months and at 1, 2, 5, and 8 years. SOFI consists of 3 parts measuring hand, arm (upper), and leg (lower) function (1). Hand function is tested by 4 movements; cylinder grip (H1), pen grip (H2), pincer grip (H3) and opposition of the thumb (H4). Arm function is assessed by 3 movements; hand behind the head and the ability to touch the cervical spine processes with fingers (A1), elbow supination (A2) and elbow extension (A3). Leg function is tested by 4 movements; the ability to touch the opposite knee with the heel while sitting (L1), knee extension in supine position (L2), dorsiflexion of the foot standing on a balance board (L3), and the ability to stand on tip toes without shoes (L4). An assessor scores the patient's ability to perform the different tests on an ordinal scale (0=normal, 1= partly impaired and 2= unable to perform). The range of SOFI scores is 0–44 (best to worst).
Results: At baseline the mean (SD) SOFI was 7.2 (5.8), and at 1 year follow-up the improvement was 2.75 (5.65), p<0.001. From 1 year to 8 year follow-up the deterioration was 1.5 (4.6), p<0.001. When studying hand, upper and lower function separately, the pen grip and the ability to stand on tip toes improves most during the first year. From 1 to 8 year the pincer grip and the ability to stand on tip toes are the items that deteriorate most (Figure). Assessment of the pen grip, the pincer grip and the ability to stand on tip toes explain 58% to 70% of the SOFI score over time, with the highest rate at 5 (65%) and 8 years follow-up (70%).

Conclusions: Functioning as assessed by SOFI improved during the first year in patients with early RA and then deteriorated slowly. Over a longer period, pincer grip and the ability to stand on tip toes seemed to be the two most important items to measure when assessing functional impairment over time.

SAT0727-HPR THE EFFECT OF INSPIRATORY MUSCLE TRAINING ON AEROBIC CAPACITY, PULMONARY FUNCTION AND FUNCTIONAL STATUS IN PATIENTS WITH ANKYLOSING SPONDYLITIS: A RANDOMIZED CONTROLLED STUDY

B. Basakci Calik, E. Gür Kabul, H. Taskın, O. Telli Atalay, U. Bas Aslan, M. Tascı, F. Bıcakcı, A.I. Yıldız. *Pamukkale University, Denizli, Turkey*

Background: In ankylosing spondylitis (AS) the chronic inflammatory process mainly affects the axial skeleton with ensuing pain and limitation of thoracic and spinal mobility. Most of the AS patients have the complaint of reduced exercise capacity. Pulmonary function impairment, chest wall restriction, weak respiratory muscle performance, peripheral muscle weakness and deconditioning have been reported as the hypotheses for reduced exercise capacity.
Objectives: The aim of this study was to evaluate the effects of inspiratory muscle training on aerobic capacity, pulmonary function and functional status in patients with AS.
Methods: A total of 32 patients (18 female, 16 male; mean age: 37.3±10.4 years) were included in this study. The patients were randomized as two groups; Group I consisted of 16 patients, received inspiratory muscle training (IMT) in addition to conventional exercise (CE), Group II consisted of 16 patients, received only CE. All assessments were done before and after the training (8 weeks) for every patient. Standard pulmonary function tests were applied for pulmonary volumes. Maximum inspiratory pressure (PImax), maximum expiratory pressure (PEmax) were also measured as respiratory muscle strength. Six-minute walk test (6MWT) was used for the assessment of aerobic capacity. For the evaluation of functional status, the Bath Ankylosing Spondylitis Functional Index (BASFI), Bath Ankylosing Spondylitis Disease Activity Index (BASDAI), Bath Ankylosing Spondylitis Metrology Index (BASMI) were used. CE training program consisted of 20 exercises: motion and flexibility exercises of the cervical, thoracic, and lumbar spine; stretching of the hamstring muscles, erector spine muscle, and shoulder muscles. IMT training load was based on 50% of the patient's sustained maximum inspiratory pressure. The patients started by performing ten loaded inspiration with a 60 second rest period between each inspiration for three sets in each session. Four sessions of IMT was applied in a day. The exercises were performed as home program for five days per week, 40 minutes per session. Wilcoxan test was used to compare groups.
Results: After eight weeks follow-up, patients in Group I had a significant increase in PImax (p=0,000), PEmax (p=0,05), and 6MWT (p=0,041) compared with Group II (p=0,134, p=0,020, p=0,281, respectively). There were no significant differences of spirometric measurements. Comparison of the groups showed significantly superior results for group I in BASDAI (p=0,049).
Conclusions: Ankylosing spondylitis patients who performed eight weeks of inspiratory muscle training in addition to conventional exercise training, had an increased respiratory muscle strength, a better aerobic capacity, and disease activity than those who performed conventional exercise only. Inspiratory muscle training should be disseminated with these patients due to advantages.

SAT0728-HPR A PATIENT SATISFACTION SURVEY: PATIENTS' PERCEPTIONS OF BIOLOGIC DOSE TAPERING

C. Jones, H. Robinson, D. Rees, V. Jolliffe, J. Trickey, J. Wood, S. Andrews, S. Capillas, A. Peall. *Rheumatology, Wye Valley NHS Trust, Hereford, UK*

Background: Evidence shows that remission can be maintained in selected patients whose biologic medication is dose tapered[1]. In June 2015 we began tapering the doses of selected rheumatoid arthritis, ankylosing spondylitis and psoriatic arthritis patients in disease remission. The process was agreed with the local commissioners and a protocol[2] was devised to guide safe and evidence based biologic dose tapering. Benefits include reduced medication burden for patients, fewer day-case infusions and financial savings. However, there is a lack of knowledge of patients' perceptions of the process.
Objectives: Our department proposed to investigate patients' perceptions of their experience of dose tapering. We wanted to assess patients' understanding and acceptance of the process and ensure they felt included in decision making. Patient feedback enables reflection and improved practice.
Methods: An anonymous, tick-box, patient satisfaction survey was devised. It requested that patients stated the extent to which they agreed with a statement, also allowing free-text comments. The survey was posted to relevant patients after their identification from our biologics database. A stamped addressed envelope was provided for return of the completed survey.
Results: 56 surveys were posted, 46 (82%) were returned. 31 (67%) of patients were pleased to taper their medication, 35 (76%) felt fully included in decision making and 36 (78%) agreed that they had the opportunity to ask questions. Of the 13 patients whose disease flared post-taper, 8 (62%) agreed that they were promptly reviewed in clinic, 1 patient (8%) disagreed.
Some admitted to anxiety prior to dose tapering, however once established on their new dose, continuing disease remission was reassuring. Patients felt that they could contact the rheumatology helpline if required. Some also expressed that their quality of life had improved due to the decreased medication burden.
6 (37.5%) of the 16 rituximab patients who replied, disagreed that they were included in the decision to dose taper. Therefore, clinicians must ensure information provided is clear, that a full discussion occurs and the patient has an opportunity to ask questions. On review, it was evident that the wording of the survey may have caused confusion for rituximab patients. The term "dose reduction" may have suggested that the dose of medication in their infusion was reduced. In practice, the patient decreased from two infusions to one.
Conclusions: The majority of patients expressed that they were content with the biologic dose tapering process and felt sufficiently included in decision making. Importantly, a large proportion of patients were of the opinion that they were reviewed quickly when their disease flared.
Practice can be improved from the knowledge that some patients would appreciate more communication regarding the decision to dose taper. Also, when undertaking further patient surveys, questions must be clear and unambiguous.

SAT0729-HPR PSYCHOLOGICAL PROFILE OF PATIENTS WITH FIBROMYALGIA SYNDROME

D. Xhaxho[1], J. Lauri[2], M.A. Lauri[3], J. Fleri Soler[1], A. Borg[1], C. Mercieca[1]. *[1]Rheumatology, Mater Dei Hospital; [2]Mathematics; [3]Psychology, University of Malta, Swatar, Malta*

Background: Fibromyalgia (FM) is a chronic non inflammatory condition characterized by pain and fatigue as well as physical and psychological symptoms. Management can be particularly challenging and a combination of pharmacological and non pharmacological treatments are recommended.
Objectives: The aim was to study the level of anxiety and depression in fibromyalgia patients and whether these were associated with symptom severity, functional status, social or demographic factors.
Methods: A cross sectional survey of 155 consecutive patients attending the nurse-led fibromyalgia clinic was carried out. Patients were diagnosed using the 2010 ACR diagnostic criteria. Demographic data, Widespread Pain Index (WPI), Symptom Severity Score (SSS), VAS pain and VAS fatigue were recorded. Patients filled in the self-administered questionnaires including the Revised fibromyalgia impact questionnaire (FIQR), Hospital Anxiety and Depression Scale (HADS). Patients were classified as suffering from high anxiety or depression if HADS was $\geq$11, moderate if 8–10 and low $\leq$7 for each scale respectively.
Cross tabs and chi squared were used to study associations between anxiety and depression and social and demographic factors. Logistic regression analysis was performed to identify whether WPI, SSS, FIQR, VAS pain and VAS fatigue were predictors of severe anxiety and depression.
Results: One hundred fifty five patients (92% female) participated in the survey. The average age was 50.3 years (SD 11.5) and mean duration of symptoms 13.4 years (SD 11.3). The mean HADS-A (anxiety) was 11.8 (SD 4.13), HADS-D (depression) 9.1 (SD 3.8) and FIQR 60.3 (SD 17.6).
High levels of depression were reported by 31.5%, moderate 32.1% and low 30.3%. High levels of anxiety were reported by 60%, moderate 21.2% and low 13.3%. Both high levels of anxiety and depression were found in 25.2% of patients.
SSS was the single best predictor for anxiety (p=0.001) while disease duration (p=0.01), SSS (p=0.02) and FIQR (0.04) predicted depression. VAS pain and VAS fatigue were not good predictors of severe anxiety and depression. When patients with high levels of anxiety and depression were compared with those with moderate and lower levels no association was found with age or social factors including occupation, marital status, level of education and family support.
Conclusions: Both severe anxiety and depression were highly prevalent in our FM cohort, particularly anxiety. All FM patients need to be screened for anxiety and depression particularly those with high SSS and FIQR scores and longer disease duration.
A psychiatrist and psychotherapist with a special interest in FM are essential members of the multidisciplinary team to ensure that anxiety and depression are addressed early prior to starting further interventions for FM.

SAT0730-HPR DIFFERENCES IN PERCEPTION OF THE DISEASE CONSTRAINTS BETWEEN THE CHILD AND PARENTS IN JIA

E. Ünal[1], P. Kısacık[1], G. Arin[1], N.B. Karaca[1], E.D. Batu[2], Z.S. Arıcı[2], E. Sönmez[2], Y. Bilginer[2], S. Özen[2]. *[1]Department of Physiotherapy and Rehabilitation, Hacettepe University Faculty of Health Science; [2]Pediatric Rheumatology, Hacettepe University Faculty of Medicine, Ankara, Turkey*

Background: Studies suggest that the perception of the child and family differ in juvenile idiopathic arthritis. This may pose a problem for the clinician's assessment (1,2).
Objectives: The aim of this study was to evaluate the differences in perception of the disease constraints between child and parent in JIA.
Methods: 129 children with JIA were included in the study.The main complaint about the illness was requested to be expressed in writing by both the child and the family. Individuals' expressions and demographic data were recorded. The main complaints were considered nominal. The correlation between the parent's and child's expressions were examined. The types of complaints were classified as none, functional, symptomatic, and both functional and symptomatic.
Results: The age range of children ranged from 6 to 21 (mean±SD; 12,86±3,68). When the complaints of the 129 children and the parents were compared, 45,7% were different, 20,2% were partially similar and 34,1% were perfectly similar complaints.When the answers of the 59 children and parents who differ in their complaints were examined; 67.8% of the children expressed a milder disease than their parents (Table1). While the family mostly concentrated on the symptoms, the children were worried on functional complaints (Table1).

Table 1. Results of the evaluations

	Child + Parent (n=129)	Differing perception of problems in the child and parent (n=59)
Group of complaint - Child		
None n (%)	49 (38)	16 (27,1)
Function n (%)	43 (33,3)	23 (39)
Symptom n (%)	20 (15,5)	9 (15,3)
Function + Symptom n (%)	17 (13,2)	11 (18,6)
Group of complaint - Parent		
None n (%)	50 (38,8)	16 (27,1)
Function n (%)	10 (7,8)	4 (6,8)
Symptom n (%)	57 (44,2)	36 (61)
Function + Symptom n (%)	12 (9,3)	3 (5,1)

Conclusions: As a result of this study, there was a difference between parent's and child's perception of the disease. While children report functional complaints, parents focus on symptomatic complaints. Exercise approaches should focus on the child's functional complaints and identify common goals with the family. Families should be educated about the importance of the complaints that the child expresses.

SAT0731-HPR SYMPTOMS OF PAIN, FATIGUE AND SELF-EFFICACY IN YOUNG PATIENTS WITH SPONDYLOARTHRITIS – A COMPARISON BETWEEN WOMEN AND MEN

A. Torell[1], A. Bremander[2,3,4], S. Bergman[3,4,5], E. Haglund[2,4]. *[1]Department of physiotherapy, Ängelholms sjukhus, Ängelholm; [2]School of Business, Engineering and Science, Halmstad Univeristy, Halmstad; [3]Department of clinical Sciences, Lund, Section of rheumatology, Lund University, Lund; [4]Spenshult R&D center, Sweden, Halmstad; [5]Primary Health Care Unit, Department of Public Health and Community Medicine, Institute of Medicine, The Sahlgrenska Academy, University of Gothenburg, Gothenburg, Sweden*

Background: Spondyloarthritis (SpA) often has an early disease onset with inflammatory back pain debuting already in young adulthood. Studies have shown gender differences in disease specific areas but few studies have focused only on the younger subjects. Extended knowledge based on self-reported information can help to better understand the characteristics of these younger women and men with SpA.
Objectives: To study the differences between young women and men with SpA with regard to self-reported pain measures, disease activity, fatigue, self-efficacy and health status.
Methods: A cross-sectional population based cohort of 201 patients age 18–36 years with SpA identified through a health care register by searching for ICD-10 codes for SpA between the years 2003–2007. They all responded to a questionnaire survey in 2009. 29% were diagnosed with ankylosing spondylitis, 39% with psoriatic arthritis, and 32% with undifferentiated spondyloarthritis. The survey included questions concerning pain (NRS 0–10 and a pain mannequin), fatigue (NRS 0–10), self-efficacy (ASES 10–100, low-high). The pain mannequin was used to categorize patients into groups; no chronic pain (NCP), chronic regional pain (CRP)or chronic widespread pain (CWP). Self-reported disease activity (BASDAI 0–10) and health status (EQ5D, 0–1) were used to describe the group. Characteristic symptoms are reported as mean, standard deviation (SD) and frequencies. T-test and Chi2 test were used to study gender differences.
Results: The mean age (SD) was, 30 (5) years, 60% were women. The group reported disease activity scores (BASDAI) of 3.8 (2.3), health status 0.75 (0.16), and a disease duration of 7 (5) years. One third were smokers or former smokers, and 69% reached WHO's recommended level of health enhancing physical activity. 21% reported CRP, 41% CWP and the remaining 38% reported NCP. More women reported CWP pain than men, (48% vs. 30%, p=0.026). Women also reported worse pain compared to men, (3.9 (2.4) vs. 2.9 (2.1), p=0.001), worse fatigue (5.0 (2.6) vs. 3.9 (2.7), p=0.003), less self-efficacy for pain (53 (20) vs. 59 (21), p=0.040) and also for symptoms (59 (19) vs. 65 (20), p=0.038).
Conclusions: A significant proportion of both women and men reported symptoms consistent with chronic widespread pain already at young age. Women reported in general worse health compared to men, including pain distribution, pain intensity and pain management. This information could be valuable for clinicians in the care of young patients with SpA.

SAT0732-HPR RESILIENCE AND POSITIVE AFFECT ARE RELATED TO THE EXPERIENCE OF FATIGUE IN PATIENTS WITH A RHEUMATIC DISEASE

E. Taal[1], K. Schreurs[1], L. Guddorf[1], C. Bode[1], M. van de Laar[2]. *[1]Psychology, Health & Technology, University Twente; [2]Rheumatology, Medisch Spectrum Twente, Enschede, Netherlands*

Background: Fatigue is a common symptom in patients with a rheumatic disease. Resilience, the ability to bounce back or recover from stress, has been found to be related to lower fatigue in patients with cancer, traumatic brain injury, cardiac disease and fibromyalgia (see e.g. [1])
Objectives: To study the relationships of resilience and the resilience related factors positive affect, acceptance and engaged living with fatigue in patients with rheumatic diseases.
Methods: 57 patients with a rheumatic disease (rheumatoid arthritis, 70%; osteoarthritis, 11%; others, 9%) completed an online questionnaire. Fatigue was assessed with SF-36 vitality scale; pain with a VAS; Resilience with BRS and resilience related factors with PANAS (positive affect), AAQ-II (Acceptance) and ELS (engaged living). Data were analysed with hierarchical multiple regression analyses.
Results: Resilience, positive affect, acceptance and engaged living were multivariate significantly related to fatigue (R^2 =0.54; $P \leq 0.001$). Resilience (β=0.29; $P \leq 0.05$) and positive affect (β=0.39; $P \leq 0.01$) were significant individual predictors of lower fatigue in multiple regression analysis. Acceptance and engaged living were not significantly related with fatigue in the multivariate model. The relationship between resilience and fatigue was partially mediated by positive affect. When pain was included in the model the relations of resilience (β=0.27; $P \leq 0.05$) and positive affect (β=0.34; $P \leq 0.05$) with fatigue remained significant.
Conclusions: Resilience and positive affect may be predictors of decreased fatigue in rheumatic patients. Further longitudinal studies are needed to examine the causality of these relationships.

SAT0733-HPR A QUALITATIVE STUDY ON OBSTACLES AND MOTIVATIONS TO VACCINATIONS IN RHEUMATOID ARTHRITIS

F. Fayet, C. Savel, M. Rodere, M. Soubrier, S. Mathieu. *Rheumatology department, CHU Clermont-Ferrand, Clermont-Ferrand, France*

Background: Rheumatoid arthritis (RA) is characterized by an increased risk of infection, which is further enhanced by the associated treatments like corticosteroid therapy or biologicals. To diminish this risk, influenza and

pneumococcal vaccinations have been recommended prior to initiating treatment with biological agents. The COMEDRA trial, conducted in France, revealed the usefulness of a nurse-led consultation in the management of RA-associated comorbidities. Despite this, however, only 40% of patients were shown to be appropriately vaccinated (1).
Objectives: This study sought to better understand the obstacles encountered in RA patients as to influenza and pneumococcal vaccinations, along with their motivations.
Methods: This qualitative study was conducted at the rheumatology department by means of semi-directed nurse-led interviews lasting about 45 minutes, between July and November 2015. Four topics were analyzed: obstacles and motivations to influenza vaccination, obstacles and motivations to pneumococcal vaccination, post-vaccination follow-up, and information sources. The interviews were registered and transcribed within 45 hours post-interview, and were pursued until data saturation. Transversal data analysis was carried out by the nurse in charge of the interview, then by a second nurse, with the two analyses assembled according to the traditional concept of double reading. Differences between both analyses were thoroughly discussed, with a consensus sought by a third researcher, namely a rheumatologist, as necessary.
Results: Overall, 15 interviews were conducted involving 11 women and 4 men, with a mean age of 63 years (29–83). All patients were suffering from RA and undergoing at least one immunosuppressant therapy. Most (80%) were vaccinated against pneumococcus, but only 33% against influenza, with eight patients declaring having been affected by influenza and one by pneumococcus-related pulmonary disease.
The obstacles to vaccinations, revealed during the interviews, primarily concerned fears of unwanted effects in relation with the vaccinations, particularly concerning the influenza vaccination. The patients also reported anxieties in relation with the vaccines' excipients, with overdoses, or with disease reactivation. Moreover, media impact, contradictory information, the fact that vaccinations were not always proposed, and the lack of traceability may also be considered obstacles against vaccinations. Influenza is often considered a benign disease, and the vaccine poorly efficacious. Patients with prior influenza were more motivated towards vaccination. The primary motivation reported by the patients, and especially as to the pneumococcal vaccination, was the protection provided by the vaccine. The perception of frailty and increased infection risk associated with the disease and its treatments were other sources of motivation, and particularly when vaccination was highly recommended by the physicians, and when there had been no public controversy.
Conclusions: The fears and motivations associated with these two vaccinations are not identical. Influenza vaccination appears to be poorer perceived, patients reporting more fears related to it. With respect to pneumococcus vaccination, we only collected a few comments, given that the vaccine is less well know, and thus better accepted.

SAT0734-HPR THE EFFECT OF RHEUMATIC DISEASES ON WORK ABILITY: A STUDY OF SELF-ASSESSMENT OF SF-36 IN PATIENTS WITH SMART SYSTEM OF DISEASE MANAGEMENT (SSDM)

H. Song[1], J. Gu[2], H. Wu[3], S. Li[4], Y. Zhao[5], H. Sun[6], J. Huang[7], X. Li[8], R. Wu[9], B. Wu[10], C. Xiao[11], L. Qian[12], F. Xiao[13], H. Xiao[13], M. Wang[13], Y. Jia[13], Z. Zhang[5]. *[1]Department of Rheumatology and Immunology, Department of Rheumatology and Immunology, Beijing; [2]The Third Affiliated Hospital of Sun Yat-sen University, Guangzhou; [3]Department of Rheumatology and Immunology, Dongguan People's Hospital, Dongguan; [4]The First Affiliated Hospital of PLA General Hospital, Beijing; [5]Department of Rheumatology and Immunology, The First Affiliated Hospital of Harbin Medical University, Harbin; [6]Shandong Provincial Hospital, Jinan; [7]The sixth Affiliated Hospital of Sun Yat-sen University, Guangzhou; [8]Anhui Medical University Affiliated Provincial Hospital, Hefei; [9]The First Affiliated Hospital of Nanchang University, Nanchang; [10]The First People's Hospital of Jingzhou, Jingzhou; [11]TCM-Integrated Hospital of Southern Medical University, Guangzhou; [12]The Second Affiliated Hospital of Medical University of Anhui, Hefei; [13]Medical Department, Shanghai Gothic Internet Technology Co., Ltd., Shanghai, China*

Background: A variety of rheumatic diseases can significantly affect the patient's quality of life and work ability. SF-36 is a commonly used tool to assess the quality of life and work ability in patients with chronic disease. In the past, most patients were guided by doctors/nurses to assess SF-36 in a paper form. At present, there is a lack of research on the quality of life in patients with rheumatic diseases by using new mobile tools in the real world.
Objectives: To explore the effect to the life ability of rheumatic disease and the potential association between the disease activity and SF-36 in patients with rheumatoid arthritis (RA) using SSDM.
Methods: SSDM is a new smart disease management mobile tool, which includes physicians' and patients' application system. After entering the results of SF-36 assessment by patients, all data can be synchronized automatically to the mobile terminal of authorized rheumatologist. According to the scores of SF-36 ($<$12.5, 12.5–50 and $>$50), the quality of life was divided into three levels: poor, moderate and good.
Results: From June 2016 January 2017, data were extracted online from the mobile terminals of 839 adult patients (284 male and 555 female) in 62 hospitals across China. All patients performed self-assessment of SF-36 for a total of 1,065 times. The mean age was 38.12±13.87 (18 to 81) years and the median disease duration was 20.60 (0 to 573) months. There are 25 kinds of rheumatic diseases involved, including RA (23%), ankylosing spondylitis (AS, 19%), systemic lupus erythematosus (SLE, 13%), osteoarthritis (OA, 11%), Sjogren syndrome (SS, 10%), polymyositis/dermatomyositis (PM/DM, 6%), mixed connective tissue disease (MCTD, 6%) and others (12%).
The 8 items of SF-36 index were averaged between 49.07 (General Health perceptions, GH) to 74.12 (Physical Functioning, PF). The overall mean score of patients with different rheumatic diseases was higher than 50. However, there were 5 kinds of rheumatic diseases with average score of 5 items less than 50, including: MCTD, SS, PM/DM, AS and SLE in patients with GH score: 44.24, 44.60, 47.87, 47.93 and 49.16, PM/DM in patients with the Emotional Role functioning (RE): 47.52, Physical Role functioning (RP): 44.68 and AS patients with Reported Health Transition (HT): 49.64, respectively. In RA patients, 38% and 37% of patients reported that their ability to work were affected by disease and mood changes respectively. Bivariate correlation analysis showed that DAS28 was negatively correlated with the two item scores (RP and RE) of SF-36 index in RA patients, $p<0.01$.
Conclusions: SSDM can be used to assess SF-36 in patients with rheumatic disease. The Quality of life scores in patients with MCTD, SS, PM/DM, AS, and SLE were more likely to be affected by rheumatic disease. The disease activity (DAS28) of RA patients was negatively correlated with the work ability (RP and RE of SF-36 score).

SAT0735-HPR PATIENTS' ASSESSMENT OF THE APPLICABILITY OF THE ULTRASOUND IMAGE METHOD

J.A. Mendonça[1], W.H. Rodrigues Ferreira[2], I.M.M. Laurindo[3]. *[1]Rheumatology, Pontifical Catholic University of Campinas, Campinas; [2]Rheumatology, Gruparj Petrópolis, Petrópolis; [3]Rheumatology, Universidade Nove de Julho, São Paulo, Brazil*

Background: The applicability of ultrasonography in diagnosis and monitoring of rheumatic diseases has been steadily growing but little is known about the patient's perspective.
Objectives: To assess the patient's knowledge of the ultrasound (US) method and its clinical applicability as well as to evaluate how much was learned after a lecture.
Methods: Patients with rheumatic diseases were invited to an educational meeting that included an US lecture. They were asked to fill out a questionnaire before and after the 35-minute lecture about US and its clinical uses. The questionnaire included questions about their disease and treatment, their educational background (years of study) and ten questions about US and its clinical uses (table).These ten questions had to be answered with *"yes"*, *"no"*, or *"I am not sure"*.
Results: A total of 70 patients attended the lecture and answered the questionnaires. Their demographic characteristics were as follows: Mean ± SD: age 63±12 years, disease duration: 9.6±0.8 years, the most frequent self- reported diagnosis was rheumatoid arthritis (57,2%), while osteoarthritis accounted for another 20%. Most patients had only eight years of study (64.3%) and a university degree was reported by 14%. The questionnaire responses of 66 patients with rheumatic diseases were analysed. There was a noticeable increase in the positive responses to these questions: 1, 2, 3 and 7, after the lecture, 44%

Table - Questions :

1)Do you know what arthritis is?

2)Do you know what an ultrasound exam is?

3) Do you believe that an ultrasound exam could help in the diagnosis of your disease?

4) Do you believe that an ultrasound exam could help in monitoring your treatment?

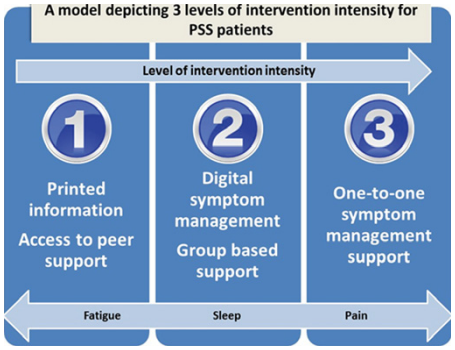
5)Have you ever had one of your joints examined by ultrasound ?

6)Has the exam changed your treatment?

7) Do you think that an ultrasound exam would help you to better understand what is happening to your joints?

8)Do you think that an ultrasound exam would help you follow the treatment ?

9) Do you believe that an ultrasound exam can detect inflammation in your joints even when it is not clinically diagnosable by your doctor?



10) Do you think that an ultrasound exam would help you to understand your illness better?

(p=0.001); 29% (p=0.001); 10% (p=0.06); 27% (p=0.009), respectively. Although only 26% of the patients have had an articular US, in 65% it led to a change in treatment. Positive answers to some questions, which were perhaps too complex, showed a discrete increase, less than 10%, conceivably due to the surprisingly high background of positive answers.
Conclusions: As expected, the US image method was familiar to most but not its applicability in articular diseases. After the lecture there was an increase in understanding of the positive impact of US in rheumatic diseases, implying that short and focused lectures are a useful tool in educational programs for patients.

SAT0736-HPR "LIKE A BAG OF LIQUORICE ALLSORTS – EVERYBODY'S GOT DIFFERENT FLAVOURS": A QUALITATIVE FOCUS GROUP STUDY TO EXPLORE SYMPTOMS OF FATIGUE, SLEEP DISTURBANCES AND PAIN IN PRIMARY SJÖGREN'S SYNDROME PATIENTS AND TO DEVELOP A FUTURE MODEL OF CARE

K.L. Hackett[1,2], V. Deary[2,3], K. Deane[4], J.L. Newton[1,2], W.-F. Ng[1,2], T. Rapley[1]. *[1]Newcastle University; [2]Newcastle upon Tyne NHS Foundation Trust; [3]Northumbria University, Newcastle upon Tyne; [4]University of East Anglia, Norwich, United Kingdom*

Background: Fatigue, sleep disturbances and pain, are symptoms of primary Sjögren's syndrome (PSS). However, current clinical interventions predominantly focus on treating patients' dryness symptoms.
Objectives: To explore the experience of fatigue, sleep disturbances and discomfort in people with PSS, to investigate the impact of these symptoms on patients' daily lives and to develop an intervention strategy to address them.
Methods: Qualitative focus groups with open-ended questions allowed participants to explore ideas together and focus on issues they perceived as being important. PSS patients (n=10) and spouses (n=3) took part in three focus groups divided into six sessions which were facilitated by two clinician researchers using a topic guide. Discussion topics included; the symptoms, strategies used by patients used to manage their symptoms, possible future intervention components proposed from the literature and possible modes of delivering future interventions. The meetings were audio-recorded, transcribed verbatim and analysed using thematic analysis[1].
Results: Patient participants all experienced these symptoms. Symptom severity varied within individuals and flares occurred unpredictably. Fatigue, sleep disturbances and discomfort, all affected patients' lives and those around them and sometimes felt overwhelming. Discomfort symptoms included oral and ocular dryness, tingling, nausea and difficulties tolerating light and noise. The invisible nature of these features meant patients often struggled to meet others' expectations, which affected their mood and resulted in social withdrawal. Fatigue was a major barrier to engaging in work, productivity and leisure activities. Sleep disturbances further compounded the fatigue. Patients employed a range of strategies to self-manage their symptoms to varying degrees of success.
Participants expressed a need for tailored support from health care professionals which included information provision, access to peer support and professional support to apply symptom management information. A three stepped model of care was proposed. The model includes different modes of delivering intervention content, including written information, education groups, peer support, digital self-management and one-to-one therapy. Intervention intensity increased with each step in the model.

Conclusions: Symptoms of fatigue, sleep disturbances and discomfort all impact on PSS patients' daily lives and individualised interventions are needed to support self-management. Care needs to be tailored as different patients require variable levels of support. A stepped model of future symptom management delivery is proposed.

SAT0737-HPR FACILITATORS AND BARRIERS FOR PARTICIPATION IN PHYSICAL ACTIVITIES IN JUVENILE IDIOPATHIC ARTHRITIS PATIENTS AND HEALTHY CONTROLS

K. Risum[1], A.M. Selvaag[1], Ø. Molberg[1], H. Dagfinrud[2], H. Sanner[1]. *[1]Oslo University Hospital; [2]Diakonhjemmet Hospital, Oslo, Norway*

Background: Knowledge is sparse regarding facilitators and barriers for participation in physical activity (PA) in patients with juvenile idiopathic arthritis (JIA) and whether they differ from controls. Furthermore, knowledge about preferences for leisure time physical activities and participation in physical education (PE) in school in JIA patients is limited.
Objectives: To explore participation in PA and PE in JIA patients, and to explore facilitators and barriers for PA participation in JIA and matched controls.
Methods: The study cohort included 60 JIA patients (50 girls, 10 boys) and 60 controls individually matched for age and sex randomly selected from the Norwegian Population Registry. Of the JIA patients, 30 had persistent oligoarthritis and 30 had polyarticular disease (extended oligoarthritis and polyarticular RF +/-). The patients were aged 10–16 years and recruited consecutively at Oslo University Hospital in 2015. Participation in PA and facilitators and barriers for PA participation, were explored with structured interviews. The interview guide was developed for this study based on literature review and clinical experience. Differences between the study groups were analyzed using the McNemar test.
Results: Participation in physical activities was not significantly different between JIA patients and controls (Table 1). The most commonly practiced organized physical activities in both groups were dancing and soccer, and the most commonly practiced unorganized physical activities were jogging, training at fitness center and strength exercising at home. Participation in PE is shown in Table 1. Fun was the most reported facilitator for participation in PA both in patients and controls, 40 (67%) vs 45 (75%), respectively, p=0.32. Becoming fit was an often reported facilitator in patients and controls, 12 (20%) vs 21 (35%) respectively, p=0.07. Being with friends was a facilitator more often reported by controls than patients, 13 (22%) in controls vs 1 (2%) patient (p<0.001). Less pain was a facilitator in 4 patients, but not in any controls (p=0.06). 26 (43%) patients and 19 (32%) controls reported barriers for participating in PA (p=0.46). More controls reported time as a PA barrier, 11 (18%) vs 3 (5%) (p=0.02), while more patients reported pain as a barrier; 18 (30%) vs 8 (13%) (p=0.03). Disease activity was a barrier in 4 (7%) patients.

Table 1. Participation in physical activity (PA) and physical education (PE)

	JIA (n=60)	Controls (n=60)	p-value
Participation in PA (organized/unorganized)	51 (85)	56 (93)	0.14
Participation in organized PA	38 (63)	47 (78)	0.11
Participation in unorganized PA	41 (68)	42 (70)	1.00
Participation in PE			<0.001
Always	42 (70)	59 (98)	
Always (sometimes with modification)	16 (27)	0 (0)	
Sometimes	2 (3)	1 (2)	

Numbers are n (%),

Conclusions: The majority of JIA patients and controls participated in organized or unorganized PA. Fun was the most reported facilitator in patients, followed by becoming fit and having less pain. Pain was the dominant PA barrier in patients, while time was the most frequently reported barrier in controls. Some patients experienced disease activity as a barrier. Nearly all the patients (97%) participated regularly in PE, but ¼ needed some modifications. These results are reassuring, and highlight the importance of enjoyment for participation in PA.

SAT0738-HPR EXPERIENCES OF TELE-HEALTH FOLLOW-UP IN PATIENTS WITH RHEUMATOID ARTHRITIS: A QUALITATIVE INTERVIEW STUDY

L.R. Knudsen[1], A. de Thurah[1,2], K. Lomborg[2,3]. *[1]Department of Rheumatology, Aarhus University Hospital; [2]Department of Clinical Medicine, Aarhus University; [3]The Research Programme in Patient Involvement, Aarhus University Hospital, Aarhus, Denmark*

Background: Recently, the effectiveness of monitoring disease activity in rheumatoid arthritis (RA) through patient reported outcome (PRO) based tele-health follow-up was tested in a randomized controlled trail, TeRA (1). The TeRA study evaluated the effectiveness of the tele-health follow-up but did not study how patients grasp this new form of disease control. Many studies on tele-medicine focus on the over-all patient satisfaction with tele-medicine follow-up, but gives limited insight into what drives patient satisfaction (2).
Objectives: To explore the experiences of a PRO based tele-health follow-up from the perspective of patients with RA with a special attention on experiences of taking a more active role and assuming more responsibility in the disease control.
Methods: The qualitative research strategy was Interpretive Description (3). From October 2015 to January 2016 we conducted individual semi-structured interviews

with 15 patients with RA who had taken part of the tele-health follow-up. The selection of participants was purposive and participants with different sex, age, disease duration and severity were included. Age ranged from 28 – 77 years and disease duration from 4 – 41 years. The analysis of the interview transcripts was inductive with a constant comparative approach. First, we identified the main themes that could describe the participants' experiences. Subsequently, we constructed patient types that could explain different perspectives on the tele-health follow-up.

Results: Five themes covered the participants' experiences with PRO based tele-health follow-up: "A flexible solution", "Responsibility", "Knowledge of RA", "Communication and involvement" and "Continuity". Two different types of personalities: "the keen patient" and "the reluctant patient", represented opposite perspectives and preferences regarding the core value of and approach to the tele-health follow-up compared to usual out-patient care.

Conclusions: In general, the participants had positive perceptions towards the PRO based tele-health follow-up and saw this as a flexible, time and resource saving solution. Disadvantages were mainly related to the missing face-to-face contact with health professionals. The two types of personalities, 'the keen patient' and 'the reluctant patient', contribute to the understanding of patients' different needs, wishes and abilities to take part in tele-health follow-up. Thus, our findings call for more insight of how tele-health follow-up could be integrated in routine clinical practice with a special attention on how to support "the reluctant" patient types.

SAT0739-HPR PATIENTS' PREFERENCES TOWARD CHARACTERISTICS OF TREATMENT WITH BIOLOGICAL AGENTS DIFFER ACCORDING TO EXPERIENCE WITH THEIR RHEUMATIC DISEASE AND TREATMENT RECEIVED OR PRESCRIBED: RESULTS FROM THE CARA STUDY

L. Sinigaglia[1], P. Sarzi-Puttini[2], L. Scalone[3,4], C.M. Montecucco[5], R. Giacomelli[6], G. Lapadula[7], I. Olivieri[8], A. Giardino[9], P. Cortesi[3,4], L.G. Mantovani[3,4], M. Mecchia[9] on behalf of CARA Study. *[1]Rheumatology Unit, G. Pini Hospital; [2]Rheumatology Unit, L. Sacco University Hospital, Milano; [3]University of Milano Bicocca, Monza; [4]CHARTA Foundation, Milano; [5]University of Pavia School of Medicine, IRCCS Policlinico San Matteo Foundation, Pavia; [6]Rheumatology Unit School of Medicine, University of L'Aquila, L'Aquila; [7]Rheumatology Unit, University of Bari, Bari; [8]Rheumatology Institute of Lucania (IRel), the Rheumatology Department of Lucania, San Carlo Hospital of Potenza and Madonna delle Grazie Hospital of Matera, Potenza and Matera, and the Basilicata Ricerca Biomedica (BRB) Foundation, Italy, Potenza and Matera; [9]MSD Italia, Roma, Italy*

Background: The development of biologic therapies has created a more complex decision-making process to select the treatment option for patients. In order to optimize the appropriateness of the decisions, it is necessary to be informed and aware of the preferences of the interested parties and the influence of their experiences on their preferences for the different treatments.

Objectives: To estimate preferences of relevant treatment characteristics valued by the different subjects involved in the management of patients with rheumatic diseases. This abstract focuses on patients' preferences.

Methods: We involved patients with rheumatoid arthritis (*RA*), ankylosing spondylitis (*AS*) or psoriatic arthritis (*PsA*), who according to clinical practice, at the time of data collection had for the first time a prescription of (*naïve*), or received treatment with (*experienced*) biological drugs for at least 3 months in the last 12 months. Through a Discrete-Choice-Experiment, the participants valued 16 possible scenarios in which pairs of similarly effective treatments were described with 6 characteristics including 2–4 possible levels each: (1) frequency of administration; (2) mode and place of administration; (3) hospitality, service, efficiency and courtesy of health personnel; (4) frequency of reactions at the site of drug administration; (5) generalized undesired reactions or allergic reactions involving the whole body; (6) additional contribution added as healthcare taxes to be paid by all the citizens to make available the treatment to target patients.

Results: 513 patients from 30 centres through Italy participated, balanced for diagnosis and treatment experience (around 20% of each subgroup). Characteristics 4, 3 and 6 were the first, second and third most important ones for every subgroup, the fourth most important characteristic was 1 (*experienced RA*), 5 (*naïve AS*), and 2 for the other subgroups. Across all the subgroups, patients generally preferred very satisfactory levels of (3), infrequent (4), mild (5), and no (6). Instead, for characteristics (1) and (2) the patients generally preferred the frequency, mode and place of administration that were closer to those actually experienced or prescribed.

Conclusions: Taking into account the different opinions of patients on at least some treatment characteristics could guide the conduction of good choices aimed to optimize benefits and to allocate efficiently resources.

SAT0740-HPR SIGNIFICANT OTHERS AS BOTH BARRIERS AND FACILITATORS FOR PARTICIPATION IN DAILY ACTIVITIES IN PERSONS WITH EARLY RHEUMATOID ARTHRITIS – AN INTERVIEW STUDY WITHIN THE SWEDISH TIRA PROJECT

M. Bergström[1], A. Sverker[1,2,3,4], Å. Larsson Ranada[1], E. Valtersson[2,3], I. Thyberg[5,6], G. Östlund[7], M. Björk[1,5]. *[1]Department of Social and Welfare Studies, Linköping University, Norrköping; [2]Department of Activity and Health; [3]Department of Medical and Health Sciences; [4]Department of Rehabilitation Medicine; [5]Department of Rheumatology; [6]Department of Clinical and Experimental Medicine, Linköping University, Linköping; [7]School of Health Care and Social Welfare, Mälardalen University, Eskilstuna, Sweden*

Background: Restrictions in participation in persons with rheumatoid arthritis (RA) have been reported to be closely connected with more pain, fatigue and difficulties in performing daily activities. In addition, support and positive interactions with others have been considered important. We therefore need to understand how significant others of persons with RA can be facilitators or barriers, in participation in daily activities. This becomes of even greater importance in the sensitive and adapting phase of early RA.

Objectives: To describe the meaning of significant others in relation to participation in daily activities in persons with early RA.

Methods: This interview study is part of the multicenter project TIRA. Fifty-nine persons (58% women) participated. Inclusion criteria were a diagnosis of RA during three years and being in working age, <64 years of age. Semi-structured interviews were conducted using Critical Incidence Technique (CIT) [1] and the material was analyzed using content analysis [2]. The study was approved by the Regional Ethics Committee.

Results: Four categories were revealed: *(1) Feelings and thoughts related to significant others*, where participants would feel like being someone's burden, taking out aggression on others, and express anxiety about how relationships and activities would function in the future. *(2) The importance of physical contact*, referring to both the problematic and manageable impact RA could have on intimate life, as well as body contact in the form of hugging. *(3) Getting the support you want*, where participants distinguished getting help they had not asked for, from helping each other out. The first being experienced as degrading, and the latter as feeling more involved in the activity. *(4) Adaption of daily activities*, referring to how the person and significant others consciously modified their activities and activity choices when needed.

Conclusions: Significant others can be either a barrier or facilitator for participation in daily activities, for persons with early RA. From a clinical point of view it is important to further involve significant others in the rehabilitation process, in order to enhance participation in daily activities for persons with RA.

SAT0741-HPR PHYSICAL PERFORMANCE AND GAIT SPEED OF FALLER AND NON-FALLER ELDERLY PEOPLE WITH KNEE OSTEOARTHRITIS LIVING IN THE COMMUNITY

M. Karapinar, A. Abit Kocaman, N. Kirdi. *Department of Physiotherapy and Rehabilitation, Hacettepe University, Ankara, Turkey*

Background: Osteoarthritis (OA) is the most prevalent chronic degenerative joint disease in the elderly population. The main signs and clinical symptoms of this disease are pain, edema, stiffness, and articular instability. OA is considered to be an intrinsic risk factor for the occurrence of falls. Falls constitute as one of the major public health concerns. They frequently have a negative impact on the daily life of elderly people and could lead an increase of dependence, fear of new falls, fractures, immobility and death.

Objectives: The purpose of this study was to compare physical performance and gait speed among older people with knee osteoarthritis with and without a history of falls.

Methods: The community-dwelling older people (65 and older) were recruited from different social senior groups and from the Hacettepe University Hospital Geriatric Outpatient Clinic. 102 patients were screened and 62 subjects with unilateral knee OA were evaluated. We used a standardized questionnaire, consisting of sociodemographic datas, cognitive function, and history of falls during the previous year. Thirty one elderly with a history of falls and also 31 without a history of falls were studied. Physical performance was evaluated with Short Physical Performance Test (SPPT). Walking speeds were measured with Six Metre Walk Test. Fear of falling (FOF) was assessed by a question (Do you have fear of falling? yes/no)
Results: There were no differences between faller and non-faller elderly people in terms of age (76±8,4 years) and BMI (30,4±3,1 kg/m^2). A statistically significant difference was found in terms of walking speeds and short physical performance test ($p<0,005$, $p<0,005$).
Conclusions: As a result of this study, it was shown that the elderly people with knee OA and who have history of falls present worse performance in functional mobility and require a longer period of time to walking.

SAT0742-HPR THE EFFECT OF A NEOPRENE KNEE SLEEVES ON KNEE JOINT PROPRIOCEPTION IN PATIENTS WITH TOTAL KNEE PROSTHESIS

M. Eymir[1], S. Narin[1], V. Karatosun[2]. *[1]School of Physical Therapy and Rehabilitation; [2]Faculty of Medicine Surgery Medicine Department of Orthopaedics and Traumatology, Dokuz Eylül University, Izmir, Turkey, izmir, Turkey*

Background: Proprioception has been defined as the perceived sense of knee joint position (joint position sense) and movement (kinesthesis) (1). The sensory input from the joint capsule, muscles, ligaments, skin improve proprioceptive acuity. With total knee arthroplasty (TKA) surgery articular cartilage, meniscuses, articular ligaments are removed. Also articular effusion and hematoma formation increase following surgery. Therefore, proprioceptive acuity decrease after TKA surgery (2). The proprioceptive improvement might prevent patients with TKA from falling down and increase their sense of security during physical activities. The clinical effect of neoprene knee sleeves on knee proprioception has been evaluated by studies in both injured and uninjured populations (3). But there is not any study research on the effect of neoprene knee sleeves on knee proprioception in patients with TKA.
Objectives: The aim of this study was to determine the effect of the neoprene knee sleeves on knee joint proprioception in patients with TKA.
Methods: Sixty patients (50 female/10 male) with a median age 64.95±8.84 years were included in the study. Knee joint proprioception of all the patients was evaluated with and without a neoprene knee sleeves preoperatively and at discharge. Patients attempted to replicate target angles (in knee joint angle 15°, 30°, 60°) using active knee extension movements in sitting position. The average of the 3 repetitions of active joint repositioning test was recorded position sense score. The angular displacements from the target angles (in knee joint angle 15°, 30°, 60°) at the end of the active reproduction tests were recorded as position sense deficit scores.
Results: Preoperatively ($p<0.001$) and after surgery ($p<0.001$) patients' proprioceptive acuity measured with neoprene knee sleeves in knee joint angle 15°, 30°, 60°, had a significant improvement. When the proprioceptive acuity measured without neoprene knee sleeves before and after surgery were compared, had a significant decrease in proprioceptive acuity ($p<0.001$) in early stage after TKA surgery. Also when the proprioceptive acuity measured with neoprene knee sleeves in knee joint angle 15°, 30°, 60° before and after surgery were compared, no significant statistical differences were observed ($p>0.05$).
Conclusions: In patients with TKA due to osteoarthritis, application of neoprene knee sleeves has increased the proprioceptive acuity. The current results suggest that neoprene knee sleeves might be used for improving proprioception in early stage of patients with TKA.

SAT0743-HPR RISK FACTORS FOR FEAR OF FALLING IN PATIENTS WITH KNEE OSTEOARTHRITIS

O. Aydoğdu, Z. Sarı, U.S. Yurdalan, G.M. Polat. *Physiotherapy and Rehabilitation, Marmara University, Health Sciences Faculty, Istanbul, Turkey*

Background: Severe knee osteoarthritis (OA) is characterized by stiffness, pain, and disability of the knee joint. Severe pain negatively affects muscle strength, coordination, postural stability, proprioception, mobility, and increases fall risk and possibly fear of falling. Individuals with severe knee OA experience loss of self-efficacy, activity avoidance, loss of self-confidence, and finally fear of falling without actually experiencing a fall (1). Despite the high prevalence of falls in patients with OA, few studies have investigated fear of falling in patients with knee OA (2).
Objectives: The present study was conducted to determine the risk factors affecting fear of falling and to investigate the relationship between fear of falling and age, gender, body mass index, pain level, range of motion, muscle strength, knee swelling, postural stability, and functional status in patients with knee OA.
The purpose of our study was to evaluate the regression of fear of falling and identify its risk factors in patients with severe knee OA.
Methods: A total of 71 patients who were diagnosed with knee OA according to the American College of Rheumatology (ACR) and who were accepted as stage 2 and 3 based on the Kellgren-Lawrence criteria, were included in the study.
Outcome measures included fear of falling, pain intensity, and range of motion, quadriceps and hamstring muscle strength, knee swelling, postural stability, and functional status.
Pearson correlation and multiple logistic regression test was used to determine the risk factors of fear of falling and relationships between fear of falling and age, body mass index, pain intensity, range of motion, muscle strength, knee swelling, postural stability, and functional status.
Results: Multiple logistic regression analysis showed that age (odds ratio=12.5, p=0.011), body mass index (odds ratio=14.5, p=0.030), pain intensity (odds ratio=3.5, p=0.045), range of motion (odds ratio=9.8, p=0.012), and knee swelling (odds ratio=8.4, p=0.019) were independent risk factors for fear of falling among patients with knee OA.
Conclusions: We conclude that age, body mass index, pain intensity, range of motion and knee swelling influence the fear of falling. They are viewed as an important predictor of fear of falling in knee OA. Our results could be used to help select knee OA patients who should be enrolled in fall prevention programmes.

SAT0744-HPR THE USE OF HEALTH ASSESSMENT QUESTIONNAIRE (HAQ) IN GIVING A PICTURE OF PATIENT EVERYDAY LIFE WITH RHEUMATOID ARTHRITIS

P. Toftegaard, I.M.J. Hansen. *Department of Rheumatology, Svendborg Hospital, Svendborg, Denmark*

Background: HAQ is used to monitor physical disability in patients with Rheumatoid arthritis (RA). At our department patients are planned to answer HAQ at every visit. The suitability for use in connection with ordinary clinical controls are questioned (1, 2) and furthermore we have the impression that the patients fill in the HAQ questionnaire because the staff wants it, and not because it make sense to the patients themselves.
Objectives: Evaluation of the HAQ from the patient perspective
Methods: A survey where all patients with RA who visited the outpatient clinic over a period of 3 weeks were invited to participate. Patients were asked to fill in a questionnaire to evaluate each question (20) in the HAQ on a scale from 1 – 10, 1 = no meaning and 10 = most meaningful. Values less or equal to five were evaluated as "no meaning". Furthermore a literature review was done, afterwards a Critical Appraisal Skills programme (CASP) was performed on publications found
Results: 100 patients were asked to participate, in total 67 questionnaires were returned, twelve patients were excluded because of incomplete answers, twenty-one did not return the questionnaires or did not want to participate. Depending on which of the 20 questions, different fractions of the patients did not find any meaning in the questions: 18.6% (are you able to shampoo and wash your hair?) up to 40.4% (are you able to use the bathtub?)
In the literature (3, 4) we found several themes of importance for everyday life with RA seen from the patients' perspective. Pain and impaired physical performance is of great significance for patients living with rheumatoid arthritis. It affects patients both physically, mentally and socially, as it may be necessary to cut back on social activities, to ask for help for ordinary everyday chores, changing or dropping work etc. This has implications for the role of the patient in the family. Powerlessness, frustration and uncertainty about the future affect the mood in form of anger and depressive thoughts.

Overall, it affects the patients' self-image and the patients' independence may be lost.

Conclusions: HAQ questionnaire is relevant in the term of defining the areas in everyday life, where the patients have problems. But the questionnaire does not contribute to elucidate the implications for the patient, which probably is the reason why many patients do not find the meaning with the questions. To evaluate the everyday living with and treatment of arthritis embedding the patient values, patient involvement in designing questionnaires is vital

SAT0745-HPR IMPACT OF AN INTERDISCIPLINARY INTERVENTION ON RA PATIENTS

I. Fortin[1], H. Sylvain[2], F. Banville[3], B. Lovisi[4], S.V. Rochefort[1]. *[1]Research, CISSS du Bas-Saint-Laurent/Hôpital Régional de Rimouski; [2]Sciences infirmières; [3]Research, Université du Québec à Rimouski, Rimouski; [4]Rheumatology, CISSS du Saguenay-Lac-St-Jean/Hôpital de Chicoutimi, Chicoutimi, Canada*

Background: Rheumatoid arthritis (RA) impairs patient function and quality of life (QoL) which, in turn, may lead to invalidity and chronicity of pain1. Even though a variety of effective treatments are available, there is still a significant portion of patients not attaining remission, of whom many continue to report moderate to high pain and fatigue despite low levels of inflammation1. Interdisciplinary interventions are promising approaches that may complement the medication effect on patient well-being and disease control, however previous studies on the effectiveness of interdisciplinary interventions seem conflicting.

Objectives: The primary objective is to compare the DAS28 response between patients receiving an interdisciplinary intervention (Intervention group) and patients followed under standard rheumatologic practice (Control group). Secondary objectives are to compare patient-reported outcomes such as pain, fatigue, general health, and patient empowerment between the two groups.

Methods: Prospective quasi-experimental, matched cohort (age, gender) study. Adult patients with a diagnosis of RA and DAS28 (CRP)$>$2.6 are eligible for the study. The Intervention group (n=28) benefits from interdisciplinary team intervention with the following professionals: rheumatologist, nurse, physiotherapist, social worker, kinesiologist, occupational therapist, and nutritionist. The Control group (n=32) receives a conventional rheumatologist-nurse intervention. Both groups see the rheumatologist approximately three times over 12 months. Interdisciplinary meetings take place in the hospital setting with the patients at Month 0 and Month 12 and without them at Month 6. The following outcome measures are used at each visit to the rheumatologist: patient pain, fatigue (Multidimensional Assessment of Fatigue; MAF), disability (HAQ), quality of life (SF-36), patient empowerment (Patient Activation Measure; PAM13), and patient satisfaction (QSC-F; only in Intervention group at Month 12).

Results: A total of 28 patients were enrolled in the Intervention group and 32 in the Control group without any significant differences in demographics or disease parameters with the exception of disease duration which was significantly higher in the Intervention group (10.9 vs. 5.8 years; p=0.021). Within 6 months of treatment, clinically important and statistically significant ($p<0.01$) improvements in DAS28 were observed in both groups which were maintained until 12 months. Overall, at 12 months, DAS28 response was comparable between groups (68% vs. 63%; p=0.140). However, when looking at patients with established RA (75% vs. 66.7%; p=0.039) and patients with low to moderate disease activity at baseline (73.9% vs. 56.5%; p=0.035), a higher response rate was observed in the Intervention group. No statistical differences were observed in the remaining outcomes between groups.

Conclusions: The results of the current study suggest that interdisciplinary interventions may be useful in conferring benefits on patient well-being and disease control that are above and beyond those resulting from medications. This seems to be particularly true among patients with established disease. Additional analyses looking into the exact mechanism of action of such interventions are required.

SAT0746-HPR TOWARDS MEASUREMENT OF PERSON-CENTERED CARE OUTCOMES IN OUTPATIENT NURSE-LED CLINICS

V. Bala[1,2], B. Fridlund[3], K. Forslind[4,5], B. Svensson[6], P. Hagell[7]. *[1]Department of Medicine, Section of Rheumatology, Helsingborg; [2]Department of Health Science, Lund University, Lund; [3]School of Health and Welfare, Jönköping University, Jönköping; [4]Department of Clinical Science, Section of Rheumatology, Lund University; [5]Department of Research and Education, Helsingborg's Hospital, Helsingborg; [6]Section of Rheumatology at the Institution of Clinical Science, Lund University, Lund; [7]The PRO-CARE Group, School of Health and Society, Kristianstad University, Kristianstad, Sweden*

Background: Person-centered care (PCC) is increasingly emphasized as a key component of effective illness management and of developing high quality of care. Despite considerable progress of PCC in many areas of care there is currently a gap and a need for means to assess PCC practice in outpatient care. In rheumatology, PCC is considered an unmet need and further development and evaluation of this approach to care is thus of high priority.

Objectives: To develop an instrument for measuring person-centered care from the perspective of the person with rheumatoid arthritis (RA) in nurse-led outpatient clinics.

Methods: A conceptual framework of PCC in the outpatient context and focusing on the meeting between the person with RA and the nurse and on the patient as an active care partner was undertaken. Based on this framework, qualitative interviews (1,2) and a literature review, a 35-item questionnaire was proposed and qualitatively tested regarding acceptability and content validity among 50 persons with RA attending a nurse-led outpatient clinic. Two versions of the questionnaire were tested: one using four response categories (0 = Totally disagree; 3 = Completely agree), and one using two response categories (0 = Disagree; 1 = Agree). Content validity was estimated by calculating Content Validity Index of the individual items (I-CVI) and of the overall instrument (S-CVI).

Results: Respondents found the items easy to understand (77%) and relevant (93%). Seventy-three percent of the respondents preferred the questionnaire version with four response categories. This version took a mean (SD) of 5.3 (2.5) minutes to complete. I-CVI values ranged from 0.87 to 1.00 and S-CVI was 0.94. About 80% of the respondents considered some items to be redundant. This resulted in a reduced 24-item draft questionnaire that yield a total score between 0–72.

Conclusions: A preliminary 24-item patient-reported PCC questionnaire was developed. Psychometric testing is needed for validation of this tool before implementation.

SAT0747-HPR CAN ACHIEVING SUSTAINED DAS REMISSION PREVENT PROGRESSION OF SUB- CLINICAL ATHEROSCLEROSIS? A PROSPECTIVE COHORT STUDY IN EARLY RHEUMATOID ARTHRITIS (ERA)

W.Y. Mak[1], Q. Shang[1], X.S.L. Lau[1], A.P.-W. Lee[1], C.M. Yu[1], E.K.-M. Li[1], P.C.H. Wong[2], L.H.P. Tam[2], K.Y. Kwok[3], M.L. Yip[4], H.T. Pang[5], V.W.-N. Lao[5], I.C.-W. Yim[6], L.S. Tam[1]. *[1]Dept of Medicine and Therapeutics, The Chinese University of Hong Kong; [2]Dept of Medicine and Therapeutics, Prince of Wales Hospital; [3]Dept of Medicine, Queen Elizabeth Hospital; [4]Kwong Wah Hospital, Hong Kong, Hong Kong; [5]Dept of Medicine and Geriatrics, Kwong Wah Hospital; [6]Dept of Medicine, Tseung Kwan O Hospital, Hong Kong, Hong Kong*

Background: Patients with rheumatoid arthritis (RA) have higher incidence of cardiovascular disease (CVD) and prevalence of arterial stiffness (AS) due to underlying inflammation. Effective immunosuppression using anti-TNF was shown to improve AS in early RA (ERA) patients.Whether it is a specific effect by blocking the TNFα pathway or suppression of inflammation remains uncertain. While achieving Disease Activity Score in 28joints (DAS) remission was associated with significant benefits in articular disease, its effect on co-morbidities such as CVD risk is uncertain.

Objectives: To investigate the effect of achieving sustained DAS remission on AS.

Methods: This randomized control trial investigates the effect of 2 tight-control treatment strategies aiming 1.Simplified disease activity score [SDAI$\leq$3.3]or 2.minimal disease activity [DAS$<$2.6] on AS in ERA patients.120 patients with active disease (DAS$\geq$3.2), symptoms onset $<$2years and bDMARDs naive were recruited and received 1-year treatment.Treatment are adjusted based on the standardized protocol every 3month aiming at either 1 of the 2 targets. AS is measured by branchial-ankle pulse wave velocity (baPWV) using a dedicated tonometry system (Omron VP-2000).

Results: In the interim analysis, results of 100 patients [male (23.0%); 52.8±13 years] completed 1year follow-up were analyzed. No significant differences between groups in clinical features, DMARD use and baPWV at month12

(M12) was observed yet significant improvement in disease activity was found in both groups.Hence,results from the 2 groups were combined to ascertain if achieving sustained DAS remission can prevent AS progression.The disease activity improved significantly [DAS: 4.8 (4.2,5.6) at baseline (BL) vs 2.38 (1.6,3.0) at M12, $p<0.001$]. 57% patients achieved DAS remission at M12 and 36% patients achieved DAS remission over 3 consecutive visits (sustained remission). No significant differences were found in disease activity, cardiovascular risk factors (CRF) and baPWV at BL between groups who can (CA) or cannot achieve (NA) sustained remission. At M12, no significant differences in CRF and baPWV were found between groups.However, the change in baPWV was significantly different between CA and NA group [-65.5 (-147.25, 44.0) cm/s vs 39 (-65.25, 124.75) cm/s, $p=0.005$]. The differences remained significant in the %change of baPWV [-4.4 (-9.67–2.84)% vs 2.51 (-4.34–10.28)%, $p=0.006$].I n univariate analysis,assocation of change in baPWV and potential predictors included BL baPWV, blood pressure (systolic & diastolic) and sustained DAS remission was found.By multivariate analysis,achieving sustained DAS remission was an independent predictor for baPWV reduction.

Table 1 – Changes in baPWV over a period of 12 months in patients who can or cannot achieve sustained DAS remission in 3 consecutive visits

	Sustained DAS remission in 3 consecutive visits			
	No (n=64)	Yes (n=36)	*p*	*p**
Baseline characteristics				
Female (n ,%)	47 (73.4%)	30 (83.3%)	0.259	
Age (year)	51.6 ± 12.8	54.9 ± 13.2	0.232	
DAS 28	5.01 ± 1.04	4.81 ± 0.92	0.327	
SDAI	27.4 (20.02, 41.08)	26.55 (18.95, 33.5)	0.343	
Diabetes (n ,%)	5 (7.8%)	3 (8.3%)	0.927	
Mean baPWV (cm/s)				
Baseline	1422.5 (1207.5,1581)	1478.5 (1286.3,1624)	0.166	
Month 12	1436 (1264, 1636.3)	1394.3 (1244.5, 1567.3)	0.698	
Changes in PWV (cm/s)	39(-65.25, 124.75)	-65.5 (-147.25, 44)	*0.005*	*0.02*
Percentage change in PWV, %	2.51 (-4.34, 10.28)	-4.4(-9.67, 2.84)	*0.006*	*0.012*

* Adjusted for baseline blood pressure and baPWV

Conclusions: Effective suppression of inflammation by achieving sustained DAS remission may prevent progression of AS in ERA patients.

SAT0748-HPR WORKING WITH A MUSCULOSKELETAL DISORDER – A QUALITATIVE STUDY OF WORKERS' EXPERIENCES

A. Cochrane[1], C.J. Rothwell[1], O. FitzGerald[2], P. Gallagher[3], J. Ashton[4], R. Breen[5], A. Brennan[6], O. Corcoran[7], D. Desmond[1]. *[1]Department of Psychology, Maynooth University, Maynooth; [2]School of Medicine and Medical Sciences, University College Dublin; [3]School of Nursing and Human Sciences, Dublin City University; [4]Physiotherapy Services, Beaumont Hospital; [5]Royal College of Physicians in Ireland; [6]Physiotherapy Services, AMNCH, Dublin; [7]Rheumatology Services, Waterford University Hospital, Waterford, Ireland*

Background: Musculoskeletal disorders (MSDs) are the leading cause of temporary and permanent work related disability across Europe, yet many people are able to remain at work.
Objectives: To explore perceived facilitators and barriers to staying at work amongst people experiencing MSD.
Methods: Semi-structured interviews conducted with 19 individuals who had attended musculoskeletal assessment clinics in three Irish hospitals within the preceding year with a confirmed diagnosis of non-inflammatory musculoskeletal disorder. Participants were only included if they had been in paid employment continuously for at least six of the previous 12 months. The interviews were audio-recorded and transcribed. Data were analysed using thematic analysis.
Results: Participants ranged in age from 21 to 50 years, most were female (n=16). Fifteen participants were continuing to work, while experiencing pain and some functional limitations. Job control emerged as a key factor in continued work participation, specifically, being able to organise workload and make modifications to work practices enabled participants to maintain an acceptable level of work performance. The value of work, both personal and financial, motivated people to continue to work. While some co-workers and supervisors were considered to be helpful, interviewees were concerned that they could lose their job if they asked for assistance or took time off work. Fatigue had a considerable impact on life outside of work, with interviewees reporting effects on family life and reduced participation in social activities.
Conclusions: While continuing to work was beneficial, negative spillover effects on life outside of work were commonly reported. Workers with MSD may benefit from interventions that focus on coping with pain and fatigue management, as well as those that raise awareness amongst employers.

SAT0749-HPR THE RELATIONSHIP BETWEEN SPINAL MOBILITY AND STATIC AND DYNAMIC BALANCE IN PATIENTS WITH ANKYLOSING SPONDYLITIS

B. Unver, H. Yilmaz, F. Unver. *Dokuz Eylul University, School of Physical Therapy and Rehabilitation, Department of Orthopaedic Physiotherapy, Izmir, Turkey*

Background: Ankylosing spondylitis (AS) is a major chronic rheumatic disease that predominantly affects axial joints, determining a rigid spine from the occiput to the sacrum. The disease can lead to permanent spinal deformity and postural disorder during the later stages. Changes in axial mobility may lead to impaired postural control, with altered postural control being associated with increased fall risk and lower quality of life. The population with AS has been rarely studied regarding postural control, both dynamic and static.
Objectives: The aim was to investigate the relationship between spinal mobility and static and dynamic balance of patients with mild to moderate AS.
Methods: The study included 137 (74 male and 63 female) patients with a mean age of 51.19±10.72 (20–78) years who were diagnosed with AS according to the modified New York criteria. Patients were divided into two groups as tragus to the wall distance (TWD) <15 cm (Group I = mild AS, n=51) and TWD ≥15 (Group II = moderate AS, n=84). The mean duration of disease in Group I was 17.83±11.3 (1 - 50) years and the mean duration of disease in Group II was 20.78±9.67 (2 - 43) years. Spinal mobility measurements [TWD, cervical rotation (CR), modified Schober test (MST), lumbar lateral flexion (LLF), intermalleolar distance (IMM), thoracic expansion (TE) tests] were compared with static and dynamic balance tests in the groups. Static balance was assessed with one-foot standing with eyes open and closed. Dynamic balance was assessed with timed up and go test and Berg balance scale.
Results: A statistically significant difference was found between spinal mobility measurements and Berg balance scale scores between the groups. Spinal mobility values of Group II were worse than Group I ($p<0.05$). Berg balance scale scores were better in Group I than Group II ($p=0.028$). No statistically significant difference was found between the two groups in terms of static balance and timed up and go test ($p>0.05$). There was a weak and significant correlation between spinal mobility measurements [CR, MST, LLF, IMM, and TE] and static and dynamic balance in the positive direction ($r=0.177–0.284$, $p<0.05$). There was no significant correlation between TWD and static and dynamic balance ($p>0.05$).
Conclusions: In patients with AS, as the severity of the disease progresses, spinal mobility and dynamic balance worsen; however, the static balance does not change. These changes in the posture and balance can negatively affect patients' participation levels in daily life and increase their risk of falling. For this reason, we think that detailed evaluation of balance, balance training and fall preventing approaches should be included in the rehabilitation programs for the patients with AS.

SAT0750-HPR "IS THIS REALLY THE WAY WE SHOULD GO?" – PATIENT PERSPECTIVES ON RHEUMATOID ARTHRITIS MANAGEMENT

C.A. Lemay[1], K. Mazor[2], J. Kremer[3], W.B. Nowell[4], C. Bingham III[5], J. Curtis[6], E. Ruderman[7], L. Harrold[8]. *[1]Orthopedics, University of Massachusetts Medical School; [2]Meyers Primary Care Institute, Worcester; [3]Albany Medical College, Albany; [4]Global Healthy Living Foundation, Upper Nyack; [5]Johns Hopkins University, Baltimore; [6]The University of Alabama at Birmingham, Birmingham; [7]Northwestern University Feinberg School of Medicine, Chicago; [8]University of Massachusetts Medical School, Worcester, United States*

Background: Current rheumatoid arthritis (RA) treatment guidelines suggest aggressive management in order to minimize disease activity. To achieve this goal, clinicians will need to engage patients in shared decision making. Currently little is known regarding patient's preferences and goals for treatment.
Objectives: To understand patient perspectives on their goals with regard to RA disease and flare management and the barriers to, and facilitators of achieving those goals.
Methods: Participants were interviewed utilizing open-ended questions focused on understanding their goals of managing their disease (both disease flares and longstanding disease) as well as the barriers and facilitators of achieving those goals. We explored the following: disease impact; disease beliefs and behaviors; medication use; provider relationship and communication; availability of insurance coverage; and community resources. Interviews were recorded and transcribed. Data were categorized using content analysis techniques. Convenience sample of persons living with rheumatologist-diagnosed RA was recruited from rheumatology practices in 4 states to participate in telephone interviews.
Results: Twenty-seven participants completed an interview from March-August 2015. Mean age was 63 years; 82% were female and 82% Non-Hispanic White. Participants reported living with RA for an average of 12 years and 44% reported

that their RA was not well controlled. The most common participant goal was to improve or maintain physical function. Barriers to RA and flare management included: 1) Patient Level- lack of knowledge of how to manage flares and a reluctance to change or use medications, related to concerns about potential side effects, and limited understanding of the potential benefits; 2) Provider Level- inadequate communication between patient and provider, specifically in relation to flare management and; 3) Health System Level- difficulty navigating insurance, handling coverage gaps, affording high medication costs. Facilitators of RA and Flare management included: 1) Patient Level- successful use of non-medication approaches to disease management and the willingness to initiate conversation with their provider about changing medications and; 2) Provider Level- a positive relationship with their provider, including having trust in the provider, easy access to the provider, and positive communication.

Conclusions: We identified patient-, provider and health system-barriers and facilitators experienced by RA patients achieving their treatment goals. A common theme that emerged was inadequate shared decision making between patients and their providers related to lack of patient knowledge, inadequate communication, and mistrust.

SAT0751-HPR THE RELATIONSHIP BETWEEN ANAEROBIC EXERCISE CAPACITY AND ISOMETRIC LOWER EXTREMITY MUSCLE STRENGTH IN CHILDREN WITH JUVENILE IDIOPATHIC ARTHRITIS

D. Bayraktar[1], S. Savci[2], E. Manci[3], O. Altug-Gucenmez[4], B. Makay[4], N. İlcin[2], S.E. Unsal[4]. *[1]Faculty of Health Sciences, Department of Physiotherapy and Rehabilitation, Izmir Katip Celebi University; [2]School of Physical Therapy and Rehabilitation; [3]Institute of Health Sciences; [4]Faculty of Medicine, Division of Pediatric Rheumatology, Dokuz Eylul University, Izmir, Turkey*

Background: Juvenile idiopathic arthritis (JIA) is a chronic disease that occurs before the age of 16 years. It was shown that anaerobic exercise capacity, which is important for most daily activities in children such as jumping, hoping and climbing was diminished in JIA. Previous studies showed that anaerobic exercise capacity was related to well-being level, functional status, and aerobic exercise capacity in JIA. However, no data is available about the relationship between lower extremity muscle power and anaerobic exercise capacity in children with JIA.

Objectives: To determine the possible relationships between lower extremity muscle strength and anaerobic capacity.

Methods: Forty-six children with JIA (14 F, 32 M), with a mean age of 13.74±2.29 years (min-max: 9–17 years) were included in the study. Isometric lower extremity muscle strength was assessed with a hand-held dynamometer at the end points of knee flexion, knee extension, hip flexion and hip extension movements, which are generated from gross lower extremity muscles and important for anaerobic power. All the muscle testing was performed on the right leg. Anaerobic exercise capacity was measured performing a 30-second Wingate test. Both absolute and per kilogram values for peak power and average power were noted. The relationships between the parameters were determined with Pearson's correlation coefficient. (Relationship levels were interpreted as 0.05–0.30: low correlation; 0.30–0.40: low-moderate correlation; 0.40–0.60: moderate correlation; 0.60–0.75: good correlation; 0.75–1.00: good-excellent correlation.

Results: All children completed the assessments without any adverse effects. Demographics, average isometric lower extremity muscle strengths and parameters related to the anaerobic exercise capacity testing were shown at Table 1. Moderate to good correlations were determined between isometric muscle strength and anaerobic exercise capacity parameters $p<0.001$ (Table 2).

Table 1. Demographics, isometric lower extremity muscle strength and anaerobic exercise capacity parameters

	Mean±SD
Age (years)	13.74±2.29
Height (cm)	159.72±11.08
Weight (kg)	53.76±14.95
BMI (kg/m^2)	20.76±3.92
Hip Flexion (kg)	16.81±5.47
Hip Extension (kg)	13.57±4.50
Knee Flexion (kg)	17.72±5.83
Knee Extension (kg)	22.08±6.94
Peak Power (W)	386.26±184.08
Peak Power (W/kg)	6.99±2.33
Average Power (W)	287.69±129.53
Average Power (W/kg)	5.22±1.60

SD: Standard Deviation; cm: centimeters; kg: kilogram; m: meter; W: watt; W/kg: watt/kilogram.

Table 2. The relationships between isometric muscle strength and anaerobic exercise capacity parameters

	Peak Power (W)	Peak Power) (W/kg)	Average Power (W)	Average Power (W/kg)
Hip Flexion (kg)	0.688*	0.629*	0.636*	0.552*
Hip Extension (kg)	0.618*	0.532*	0.581*	0.458*
Knee Flexion (kg)	0.642*	0.530*	0.630*	0.494*
Knee Extension (kg)	0.647*	0.465*	0.670*	0.469*

Pearson Correlation Test; kg: kilogram; W: watt; W/kg: watt/kilogram. *Significance at level <0.001.

Conclusions: The results of this study suggested that lower extremity muscle strength might influence the anaerobic exercise capacity. Exercise regimes including lower extremity strengthening might help improving anaerobic exercise capacity in children with JIA.

SAT0752-HPR THE MEASUREMENT OF PATIENTS' EXPECTATIONS OF A MULTIDISCIPLINARY AND DEDICATED FIBROMYALGIA PROGRAM

D. Xhaxho, A.A. Borg, C. Mercieca. *Rheumatology, Mater Dei Hospital, Swatar, Malta*

Background: Fibromyalgia (FM) is a chronic and multidimensional condition impacting the physical health and psychosocial state of the individuals. In addition to performing clinical and psychological assessments, evaluating patients' expectations may help address their specific needs and improve outcomes.

Objectives: The aim of this study was to assess the expectations of a cohort of FM patients participating in a multidisciplinary, dedicated fibromyalgia program.

Methods: This was a survey of 86 consecutive FM patients who were initiating a multidisciplinary program delivered by a rheumatologist, nurse, physiotherapist, occupational therapist, psychotherapist and GP with a special interest in FM. Patients were diagnosed using the 2010 ACR diagnostic criteria. Demographic data, Widespread Pain Index (WPI), Symptom Severity Score (SSS) were recorded. Patients filled in the self-administered questionnaires including the Revised fibromyalgia impact questionnaire (FIQR), Hospital Anxiety and Depression Scale (HADS) and a patients' expectations questionnaire. The latter consisted of both open ended and closed questions using a five- point Likert scale (1=strongly agree to 5=strongly disagree) about the following domains; physical, psychological, coping and social aspects.

Results: Eighty six patients (92% females) participated in the survey. The average age was 51.2 years (SD 10.60) and mean duration of symptoms 13.3 years (SD 11.17). The mean HADS-A was 11.6 (SD 4.37), HADS-D 8.67 (SD 3.47) and FIQR 55.9 (SD 21.64). In response to an open question about what was their main expectation from this program, just over half of the patients (52.3%) reported improvement of pain and fatigue as their most important outcome. This was followed by improved quality of life (19.3%), being able to cope better with ADLs, family and work (17.4%), obtain more knowledge about the condition (5.8%), while 15.1% did not have any expectations. When asked to rate their expectations for each specific domain: 64% expected significant improvement of physical symptoms, 74% to be able to cope better with family, hobbies and work and 66% expected an improvement of their psychological state, namely depression and anxiety. By the end of the program, 66% of the patients expected to have minimal or no symptoms. When asked to identify any lifestyle changes which could help, 30.2% mentioned a better work-life balance, 12.8% starting an exercise routine, 10.5% weight loss, 11.6% a mixture of house adaptations while 34.9% could not come up with any suggestions.

Conclusions: Expectations of fibromyalgia patients were high in all domains. This study highlights the need for multidimensional assessment and a personalised treatment approach in managing fibromyalgia. Moreover, it is very important to assess patients' expectations in order to guide interventions and set realistic achievable goals which are acceptable to both patients and clinicians. Patients' expectations are an important patient reported outcome measure, which need to be assessed.

SAT0753-HPR AWARENESS OF POSSIBLE SIDE EFFECTS OF NSAIDS AMONG THE ALBANIAN PATIENT POPULATION

E. Pistja, A. Themeli. *Continuing Education, Medical Training Center Santa Maria, Lezhe, Albania*

Background: No official published figures are available regarding the annual use of NSAIDs in Albania. Nonsteroidal anti-inflammatory drugs are used primarily to manage different pain conditions, less commonly they are used for their antipyretic effect. Although generally well tolerated, conventional NSAIDs have been associated with a wide range of adverse effects. The most common of which are gastrointestinal tract (GIT) side effects like: dyspepsia, abdominal pain, heartburn, and the most serious life–threatening gastrointestinal (GI) ulceration.
Objectives: To investigate patient awareness of the proper use and frequency of side effects in nonsteroidal anti-inflammatory drugs (NSAIDs) patients in Albania.
Methods: This study was a prospective 15 question interview of patients purchasing medications, during randomized 1 hour/day pharmacy visits over a one month study period (May 2015).
The study was conducted in 4 community pharmacies located in the city of Tirana (capital of Albania). Two hundred and ten patients were included in this study.
Results: Overall NSAIDs use during last year was 63%: Ibuprofene and diclofenac was the most used NSAIDs.
The majority of patients (58%) reported having side effects upon NSAIDs-use; gastrointestinal upset was the most frequently reported side effect.
Patients' awareness regarding proper NSAIDs use was poor, and pharmacist role in counseling was inadequate.
However, user ability to discover the most common side effect to the drug seemed not to be affected.
Conclusions: Nonsteroidal anti-inflammatory drugs use awareness and knowledge of probable serious side effects and how to handle them was not adequate. This probably reflected on high incidence of side effects. Nonsteroidal anti-inflammatory drugs are available on prescription as well as over the counter drugs.
Pharmacist involvement in education of patients using them is highly recommended and much needed to help decrease frequency of side effects.
However this is a small scale study and further studies need to be done.

SAT0754-HPR "A NECESSARY INVESTMENT IN FUTURE HEALTH". PERCEPTIONS OF PHYSICAL ACTIVITY MAINTENANCE AMONG PEOPLE WITH RA PARTICIPATING IN AN OUTSOURCED HEALTH-ENHANCING PHYSICAL ACTIVITY PROGRAM

E. Swärdh[1,2], B. Nordgren[1,2], C.H. Opava[1,3], I. Demmelmaier[1]. *[1]Department of Neurobiology, Care sciences and Society, Division of Physiotherapy, Karolinska Institutet; [2]Functional Area Occupational Therapy & Physiotherapy, Allied Health Professionals' Function, Karolinska University Hospital, Huddinge; [3]Department of Rheumatology, Karolinska University Hospital, Solna, Sweden*

Background: Health-enhancing physical activity (HEPA) is an active treatment in rheumatoid arthritis (RA) that may be difficult for patients to maintain over time. A two-year HEPA program including twice-weekly circuit training at public gyms and 150 weekly minutes of moderately intense aerobic exercise was conducted in Sweden between 2011 and 2013. Regular peer support sessions were held to guide adoption and maintenance of HEPA. Patient perceptions on maintained physical activity in RA have been minimally explored.
Objectives: To describe perceptions of physical activity maintenance during the second year of an outsourced 2-year HEPA-program among people with RA
Methods: A descriptive design with a qualitative inductive approach was used. Interviews were conducted with 18 participants with RA, including men and women differing in age, disease duration, activity limitation, perceived pain, levels of physical activity, training centers and peer support groups. Qualitative content analysis was used, and a pattern of theme, subthemes, categories, and subcategories was constructed based on the participants' perceptions of the phenomenon.
Results: A main overarching theme and three subthemes were established, called '*A necessary investment in future health* through *dedication*, *affinity* and *awareness'*, which described participants' experiences of maintenance during the second year of an outsourced 2-year HEPA-program. This was further described in eight categories with 16 subcategories. The categories described the participants'; '*mindsets, habits, commitments, social support, PA contexts, monitoring, insights in PA, and health gains'*.
Conclusions: The findings are partly in line with the theoretically derived explanations for maintenance of behavior change formulated to date, such as maintenance motives (self-determination and identity), self-regulation (skills and processes, lapse, relapse and coping) habits, resources (psychological and physical) as well as environmental and social influences. The results of this study could also be transferable to similar groups of people with RA in similar settings and useful in designing future HEPA interventions to facilitate maintenance of behavior change.

SAT0755-HPR VARIATION IN SLE-RELATED PAIN: A SEVEN YEAR FOLLOW-UP STUDY

E. Waldheim[1], S. Ajeganova[1], S. Bergman[2], J. Frostegård[1], E. Welin Henriksson[3]. *[1]Karolinska Institutet, Stockholm; [2]University of Gothenburg, Gothenburg; [3]Linköping Universitet, Linköping, Sweden*

Background: In a previous study we have shown that 24% of patients with SLE in our cohort reported high level of SLE-related pain, ≥40 mm on VAS (0–100 mm).[1] These patients with high pain level also reported significantly more fatigue, anxiety and depression and reduced health-related quality of life compared to the SLE patients with low pain level, ≤39 mm on VAS.[2]
Objectives: To investigate the variation in self-reported SLE-related pain and its association with presence of chronic widespread pain (CWP) and patient-related outcomes after seven years of follow-up.
Methods: 64 of 84 patients agreed to participate in the 7-year follow-up and answered questionnaires on pain (VAS/mm), fatigue (MAF), HRQoL (SF-36), anxiety and depression (HADS) and, in case of remaining pain > three months, marked painful body regions on a pain-drawing. Disease activity and damage (SLAM, SLEDAI, SLICC) were also captured. Nonparametric statistics were used to compare the different groups. Difference in measures (diff) between inclusion and follow-up was calculated.
Results: For the patients with low degree of SLE-related pain the previous week (≤39 mm on VAS) at inclusion, n=50, there were no significant difference at 7 years follow-up in pain, fatigue, anxiety, depression and all dimensions of SF-36, except for deterioration in physical function median diff (IQR) 0 (-10 to 5), p=0.024. Of these patients with low level of pain, 26% indicated chronic widespread pain on the pain drawing.
Among patients with high degree of pain (≥40 mm on VAS) at inclusion, n=14, half of the patients reported significantly decreased pain, diff (IQR) 45 (35 to 65), p=0.021, fatigue, 8 (8 to 17), p=0.018, anxiety, 4 (1 to 4), p=0.035 and depression, 4 (2 to 5), p=0.018 and improvements in all dimensions of SF-36 except for role emotional and social function at follow-up, $p<0.05$.
However, half of the patients with high degree of pain at inclusion reported no significant changes at follow up regarding pain, median diff (IQR) -13 (-20 to 28), fatigue, 5 (-0.3 to 6), anxiety, 2 (-1 to 3) and depression, 0 (-3 to 2). These patients reported significantly deterioration in vitality in SF-36, diff (IQR) 20 (15 to 35), p=0.0018 but no significant changes in the other dimensions of SF-36. All patients with high levels of remaining pain indicated chronic widespread pain on the pain drawing. These patients with remaining pain had significantly higher SLAM at follow-up compared to the patients with decreased pain at follow-up, p=0.017 and the patients with low levels of pain at inclusion, p=0.006. No significant differences were found regarding SLEDAI and disease damage.
Conclusions: Self-reported level of disease-related pain remain low in most patients and in some patients also significantly reduced. However, half of the patients with high level of pain at inclusion still experienced high level of pain and pain-related problems including widespread pain after 7 years of follow-up. These results suggest a transition from SLE-related pain to chronic widespread pain, which requires different pain management.

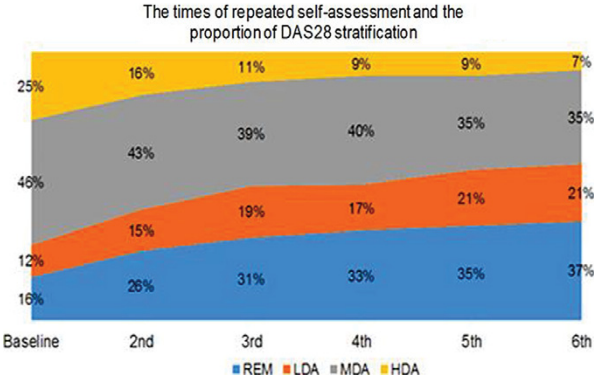
SAT0756-HPR EFFECT OF NSAID INTAKE ON KINESIOPHOBIA IN PATIENTS WITH ANKYLOSING SPONDYLITIS

G.I. Kinikli[1], S. Karahan[2], A. Ates[3], M. Turgay[3], G. Kinikli[3]. *[1]Department of Physiotherapy and Rehabilitation, Hacettepe University Faculty of Health Sciences; [2]Department of Biostatistics, Hacettepe University Faculty of Medicine; [3]Department of Rheumatology, Ankara University Faculty of Medicine, Ankara, Turkey*



Background: Spinal stiffness and loss of spinal mobility, explained byspinal inflammation and structural damage due to extensive osteoproliferation, are characteristics of Ankylosing Spondylitis (AS). AS usually disables a person with severe back pain and, in later stages, remarkable spinal kyphotic deformity.The deformity eventually may necessitate a major corrective procedure. Therefore, controlling the symptoms and progression of AS in early stages by effective medication is the main step in the management of AS.
Objectives: The aim of this study was to investigate the effectiveness of DMARD therapies on NSAID intake and kinesiophobia in patients with AS.

Methods: A total of 74 patients, diagnosed according to the modified New York criteria for AS, were enrolled. Patients were assessed to measure disease activity using the Bath Ankylosing Spondylitis Disease Activity Index [BASDAI]. Fear of movement was assessed with the Tampa Scale for Kinesiophobia [TSK]. To calculate NSAID intake and the type of NSAID, dose, percentage of days with intake were recorded, along with DMARD therapy, age, body mass index (BMI), and disease duration. The NSAID equivalent scoring was calculated according to recommendations from longitudinal clinical studies. The drug therapy groups were compared using the Kruskal-Wallis test and the Chi-square test. Correlation analysis was evaluated by Spearman's correlation coefficient.
Results: Seventy-four patients (36 women, 38 men; mean age: 43.81±10.18 years; mean disease duration: 9.89±8.50 years; BMI: 28.20±5.07) treated with four types of DMARDs (adalimumab+golimumab =17; infliximab =19; etanercept =13; sulfasalazine =25) were included. There were no drug group differences in terms of age (p=0.179), sex (p=0.886), or BMI (p=0.821). BASDAI scores (mean: 3.9±2.4) and NSAID intake (mean: 68.1±76.1; p=0.003) were significantly higher in the sulfasalazine therapy (ST) group compared to other drug groups. BASDAI scores were not correlated with age (p=0.103), disease duration (p=0.131), BMI (p=0.641) or the TSK scores (p=0.376). Different NSAID intake groups (p=0.089) had similar TSK scores.
Conclusions: Patients with AS had fear of movement independent of age, BMI or disease duration, even when they experienced positive results from drug therapies and concomitant therapy with a single oral dose of NSAID or oral corticosteroids in stable dosages.

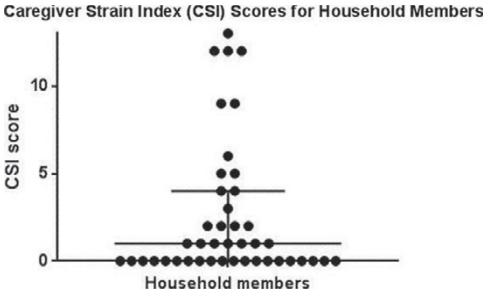
Jia[15], Z. Li[8]. *[1]Department of Rheumatology, Central Hospital of MianYang, Sichuan, Mianyang; [2]Department of Rheumatology, The First Affiliated Hospital of BaoTou Medical College, Baotou; [3]Department of Rheumatology and Immunology, The Second Xiangya Hospital of Central South University, Changsha; [4]Department of Rheumatology, Northern Jiangsu People's Hospital, Yangzhou; [5]Department of Rheumatology and Immunology, The Second Affiliated Hospital of Zhejiang University School of Medicine, Hangzhou; [6]Department of Rheumatology and Immunology, JiaXing First Hospital, Zhejiang, Jiaxing; [7]Dept.of Rheumatology, The 264th Hospital of the PLA, Taiyuan; [8]Department of Rheumatology and Immunology, People's Hospital, Beijing University Medical School, Beijing; [9]Department of Rheumatology and Immunology, The sixth Affiliated Hospital of Sun Yat-sen University, Guangzhou; [10]Department of Rheumatology and Immunology, Xiangya Hospital Centeral South University, Changsha; [11]Ningbo First Hospital, Zhejiang, Ningbo; [12]Department of Rheumatology, Suining Central Hospital, Suining; [13]Department of Rheumatology and Immunology, The First Affiliated Hospital of Henan University of Science and Technology, Luoyang; [14]Department of rheumatology, The First Affiliated Hospital of Bengbu Medical College, Bengbu; [15]Medical Department, Shanghai Gothic Internet Technology Co., Ltd., Shanghai, China*

Background: There are more than 5 million RA patients in China, but only 5,000 rheumatologists. Treat-to-Target (T2T) strategy are critical for the treatment of RA, but the Chinese rheumatologists can hardly provide patients with a complete assessment in the clinic due to limited time. The SSDM includes interfaces of both physicians' and patients' application. After entering the data of lab test records, treatment regiments, and executing DAS28 assessment by patients themselves, all data can be synchronized automatically to the authorized physicians' mobile tool. The rheumatologists can adjust treatment regiments base on patients' profile. Our previous study showed that patients in China can master the application of SSDM for accurately evaluating DAS28 and health assessment questionnaire (HAQ) after training.
Objectives: The purpose of this study is to explore the effectiveness of applying SSDM in improvement of disease activity after repeated self-assessment in Chinese RA patients.
Methods: Patients were educated to assess DAS28 with SSDM and asked to repeat the self-assessment once a month. Descriptive statistics were performed for patient and disease characteristics. According to DAS28 scores, disease activity was divided into four groups: remission (Rem), low disease activity (LDA), moderate disease activity (MDA) and high disease activity (HDA).
Results: From Aug 2014 to Jan 2017, a total of 11,867 RA patients from 459 centers in China participated in the study. The mean age was 49.27±14.35 (18 to 99) years and the median disease duration was 11.43 months. All patients performed self-assessment of DAS28, HAQ and morning stiffness time for 20,376 times. Proportion of patients in Rem, LDA, MDA and HDA was 16%, 12%, 46% and 25% respectively at baseline. Of which, 3,472 patients performed repeated assessment for 8,509 times. Proportion of patients in Rem, LDA, MDA and HDA changed into 34%, 18%, 38% and 10% at the last assessment. The proportion of T2T (DAS28 <3.2) at the last assessment was higher than that of baseline significantly (P<0.001). According to the assessments, the rate of T2T from baseline to 6 times were 28%, 41%, 49%, 51%, 56% and 58% (see Figure 1).With the increase of the times of self-assessment, the T2T rate was significantly improved (p<0.001).



Conclusions: Under repeated self-assessment of DAS28 using SSDM, RA patients can achieve better T2T result. SSDM can assist rheumatologist to rationally adjust treatment for RA patients.

SAT0758-HPR DEPRESSION BUT NOT CORE SYMPTOMS PREDICT CAREGIVER STRAIN IN ADULTS SHARING A HOME WITH PRIMARY SJÖGREN'S SYNDROME PATIENTS

K. Hackett[1], D. Lendrem[1], T. Rapley[1], V. Deary[2], K. Deane[3], J. Newton[1], W.-F. Ng[1]. *[1]Newcastle University; [2]Northumbria University, Newcastle Upon Tyne; [3]University of East Anglia, Norwich, United Kingdom*

Background: Patients with primary Sjögren's syndrome (PSS) experience a range of symptoms including dryness, fatigue, pain and low mood. The impact of these symptoms upon the people with whom they live, is unknown. The caregiver strain index (CSI) is a thirteen item questionnaire which measures strain in caregivers (Robinson 1983).
Objectives: To determine whether adults living in the same household as a person with PSS experience caregiver strain and to examine the relationship between caregiver strain and other factors.
Methods: We collected age, Carer Strain Index (CSI) and quality of life (QOL) (SF-36) scores from 62 adults who shared a home with a PSS patient. We also collected various measures from the PSS patients that they lived with. The patient measures included; age, time since diagnosis, fatigue, dryness, pain, QOL, depression, anxiety, and physical function (Improved HAQ). We conducted Spearman correlations to compare the relationship between the carers' CSI and SF-36 scores as well as the measures from the patients they lived with. We performed multivariate analyses on factors that significantly correlated with CSI scores.
Results: The caregiver strain scores are shown in the Figure. Although a median CSI score of 1 demonstrates that most AHM participants experienced very little caregiver strain, 14% of AHM participants did experience high levels (indicated with a CSI score ≥7).
Age and PSS disease duration negatively correlated with carer strain. Increased pain, fatigue, mental fatigue, physical functioning, anxiety, depression in the patients and SF-36 physical component scores in the household members all significantly correlated with increased carer strain. There was no relationship between dryness scores and age of the PSS patient and CSI scores.
Multivariate analysis suggests the main predictor of increased carer strain was depression in the PSS patient and younger age of the household member.
Conclusions: Caregiver strain is evident in a proportion of adults sharing a home with a person with PSS. Caregivers of patients with high depression scores are particularly susceptible and may benefit from additional support.

SAT0760-HPR PSYCHOLOGICAL VARIABLES PREDICTIVE OF DISORDERS OF SLEEP IN PATIENTS WITH SPONDYLARTHRITIS AND PSORIATIC ARTRTITS. PRELIMINARY MULTICENTER STUDY

L. Cano Garcia[1], M.D. Hernandez-Sanchez[2], R. Segura-Ruiz[3], C. Dominguez-Quesada[4], M.J. Peña-Vallejo[4], N. Mena-Vázquez[1], E. Vilchez-Ocaña[1], A. Fernandez-Nebro[1]. *[1]Rheumatology, Hospital Regional Universitario de Málaga, Malaga; [2]Rheumatology, Complejo Hospitalario de Jaen, Jaen; [3]Rheumatology, Hospital Reina Sofia, Cordoba; [4]Rheumatology, Hospital Virgen Macarena, Sevilla, Spain*

Objectives: To study the psychological variables associated with the severity of insomnia and hypersomnia according to the Oviedo sleep questionnaire (COS) in patients with spondylarthritis (SPA) and psoriatic arthritis (PA), including the disease activity BASDAI and DAS28.
Methods: Design. Cross-sectional descriptive study. Patients: Patients with consecutive SPA or PA were selected by consecutive sampling in follow-up in rheumatology units of 4 Spanish hospitals. Inclusion criteria: Adults (age $\geq$16 years) with SPA (ASAS criteria) or PA (CASPAR criteria) capable of understanding and willing to perform questionnaires. Exclusion criteria: other rheumatic diseases, age $<$16 years. Protocol: Upon arriving at the consultation, he was offered to participate in the study, he was explained and the patient was given the battery of questionnaires; His physician performed the evaluation of disease activity and recorded the comorbidities and current medication. Main outcomes: the 3 dimensions of COS: (1) Subjective satisfaction with sleep, (2) Insomnia and (3) Hyperinsomnia. The COS is a semi-structured interview to aid the diagnosis of insomnia and hypersomnia according to the diagnostic criteria ICD-10 and DSM-IV. Other variables: current medication for SPA or PA, comorbidities, use of sleeping pills and/or CPAP according to COS questionnaire (insomnia was divided into mild $<$15 and moderate-severe $\geq$15), disease activity: AD BASDAI) and APs (DAS28); Health-related quality of life (HRQL) using SF-36; Pain perception (Brief Pain Inventory BPI questionnaire), SPA (BASDAI) and PA (DAS28, BASDAI) and FACIT fatigue, TMMS emotional intelligence, Resilience with resilience questionnaire, anxiety and depression sceening using HADs.Statistical analysis: descriptive, bivariate analysis using T-Student, Mann-Whitney and $\chi 2$; Followed by binary logistic regression (BLR) (Vd: moderate/severe insomnia).
Results: A total of 126 patients participated: 65 patients with SPA (33.8% women, 49.92±10.92 years) and 61 patients with PA (60.7% women, 49.4±9.5 years) with an average of 8.4±6.8 years of disease. They used biological therapy SPA 29 (23%) and PA 28 (45.9%). The most common comorbidity were in SPA and PA: disc disease 33 (50.8%) and 18 (29.5%). 16 (24.6%). Both patients with SPA and PA were dissatisfied with their sleep (3.42±1.39). We did not find correlation of the COS variables with the HRQoL, the fatigue or the pain. There were no differences in COS scale according to biological treatment and/or FAME. Logistic regression analysis demonstrated an association between insomnia and TMMS repair, resilience and anxiety in PA. Insomnia in SPA showed an association with depression and BASDAI
Conclusions: Insomnia is a common health problem in these diseases. Moderate-intense insomnia in patients with SPA was associated with an increase in BASDAI and depression. Also in patients with PA, the insomnia was associated with TMMS repair, resilience and anxiety. The patient assumes the slepp dissorder as part of this chronic illness, this jutifies the good evaluations of resilience and emotional inteligence of the evaluated patients.

SAT0761-HPR IDENTIFICATION OF FACTORS THAT CONTRIBUTE TO SUCCESSFUL ONLINE MONITORING OF DISEASE ACTIVITY: EXPERIENCES FROM PATIENTS WITH RHEUMATOID ARTHRITIS

L. Renskers[1], S.A.A. Rongen[1,2], A.M.P. Huis[1], M.E.J.L. Hulscher[1], P.L.C.M. van Riel[1,2]. *[1]IQ Healthcare, Radboud Institute for Health Sciences, Radboud university medical center, Nijmegen; [2]Rheumatology, Bernhoven, Uden, Netherlands*

Background: In order to encourage patients to take an active role in their disease management and to enhance the dialogue between patients and healthcare providers, iMonitor was developed.[1] iMonitor is a Software Medical Device developed and funded by Pfizer. Patients can complete patient-reported outcome measures (PROMs) in this online system. This allows for monitoring of disease activity in between visits, identification of patients who need medical attention in between visits, and it may lead to reduction of consultations for patients with stable disease activity. Moreover, completion of a PROM might help a patient to prepare for his or her consultation and might improve the communication between physician and patient.
Objectives: This study aims to identify factors that contribute to adequate online monitoring of disease activity, by collecting experiences from patients with RA with iMonitor.
Methods: Patients were recruited at Bernhoven (Uden, the Netherlands) by an announcement of the study on the hospital website, leaflets and by specific meetings. Four instruction classes were organised in which two researchers gave live instructions about the programme. Patients received log-in codes and chose their PROM-preference(s) and PROM-frequency. After nine months a focus group interview was performed and three telephone interviews were held. Questions were semi-structured using a topic list based on Flottorp[2]. Data will be transcribed, coded and grouped.
Results: Currently 33 patients with RA are using iMonitor. Of these patients 17 (52%) attended the instruction classes and six patients (18%) attended the focus group discussion. Preliminary results reveal six themes (Technological aspects, Patient factors, Need for getting feedback, Incentives and resources, Reduction of consults and Security aspects). The Flottorp domain "Patient factors" provided most rich information. Most patients said they developed more knowledge about their disease activity and that they felt more aware about their disease activity. Additionally, iMonitor supported them in taking actions such as adjustments in lifestyle and becoming more prudent when noticing a flare. Some patients felt more prepared for a consultation and less dependent from their rheumatologist. With regard to the domain "Capacity for organisational change", patients were confident that iMonitor could contribute to reduction of consultations, but contacting the outpatient clinic when feeling worried should be required.
Conclusions: Patients' experiences with an online remote monitoring system were mainly positive. Instruction classes helped patients to get familiar with the programme. Patients experienced to have more control over their disease and to have developed more knowledge. This may result in enhanced self-management, which is important with regard to retain control over disease.

SAT0762-HPR THE ACCESSIBILITY AND USABILITY OF AN AUSTRALIAN WEB-BASED SELF-MANAGEMENT PROGRAMME (MYJOINTPAIN) FOR PEOPLE WITH LOWER HEALTH LITERACY AND JOINT PAIN IN THE UK

L.B. Parsons[1], J. Adams[1,2]. *[1]Faculty of Health Sciences; [2]Arthritis Research UK Centre for Sport Exercise and Osteoarthritis, University of Southampton, Southampton, United Kingdom*

Background: Osteoarthritis (OA) is disproportionately prevalent in people from lower socio economic groups (1). People from lower socio economic groups are also more likely to have lower health literacy. Health literacy influences people's ability to access, understand and use health information. Currently, health professionals over estimate patients' health literacy (2), potentially reducing the impact of OA self-management interventions that rely on educational approaches (3). As internet usage increases, online OA self-management resources are an option for delivering patient education. Currently, there is no evidence as to whether online education resources are suitable and accessible for people with joint pain and lower health literacy.
Objectives: To identify facilitators and barriers experienced by people with joint pain and low health literacy to access and utilise information available on the MyJointPain website. (https://www.myjointpain.org.au).

Methods: A qualitative interview study was conducted. Participants were invited to use the website for two weeks and then participated in semi-structured interviews. The interview topic guide had been developed in line with current literature. The interviews were audio recorded and transcribed verbatim. Thematic analysis was used by the main researcher (with independent verification) to interrogate the data and identify themes.
Results: Six people with low health literacy (S-TOFHLA 17±3) were recruited from community groups from an inner-city area with a high index for social deprivation. Four key themes were identified. 1) Dealing with technical issues, where participants demonstrated that they could persevere with technical problems in using online resources; 2) Information overprovision, here participants found there was too much complex health information provided, that hindered usability; 3) Motivation for information seeking, where participants discussed that it was pain that encouraged resource use but motivation to self-manage was influenced by personal beliefs; 4) Specific professional input, the participants whilst willing to use and engage with the website recalled that they also want to have access to a health professional and felt the website could supplement but not replace this contact. *"I think you have it from the health care where the healthcare are telling you and explaining to you".*
Conclusions: Digital online OA self-management presented by MyJointPain showed potential for use by people with joint pain and lower health literacy levels. This is important as outcomes for this group are poor (1). Text volume, detail and image use should be carefully considered when designing new online resources and involvement of people with lower health literacy when designing online tools will help to ensure information is accessible and useful to all OA patients. Clinicians should consider their patients' health literacy level, computer literacy and readiness to change behaviour before prescribing web based self-management tools.

SAT0763-HPR FUNCTIONAL OUTCOMES IN PATIENTS WITH RHEUMATOID ARTHRITIS ON THE BACKGROUND CORRECTION OF PROGESTERONE INSUFFICIENCY

M. Salokhiddinov[1], H. Ahmedov[2]. *[1]Tashkent Medical Academy; [2]General practicioner, Tashkent Medical Academy, Tashkent, Uzbekistan*

Background: It is known that one of the main demands of the health system is to improve preventive measures. In particular, issues of optimizing secondary prevention are very important, as it gives an opportunity to reduce the progression of the disease and complications, as well as improve the quality of life of patients. Therefore, the study values the correction of progesterone deficiency on the background of preventive and rehabilitation interventions in a general medical practice in patients with RA is of practical interest.
Objectives: Studying the role of progesterone deficiency correction efficiency to optimize secondary prevention in patients with RA in a general medical practice.
Methods: Study involved 180 RA patients aged 35,6±3,9 years. The study group (group 1) consisted of 80 patients with RA, the second 50 (group 2) and third and 50 (group 3). 1 group was carried preventive and curative interventions, based on an integrated approach with the inclusion of preventive and rehabilitation interventions on the background correction of progesterone deficiency (Duphaston) in a general medical practice. Group 2 is the same, but without the correction of progesterone deficiency, and the third group only took pathogenetic treatment. Group 3 as opposed to the 1 and 2 had displays of progesterone deficiency. For an objective assessment of the effectiveness of using EULAR recommendations, assessing the improvement in %, according to the ACR, and to assess the functional status - health status index questionnaire Stanford Health Assessment Questionnaire (HAQ)
Results: The impact of interventions carried out by us on the functional outcome showed some differences between groups. Thus, according to ACR 50 criteria dynamics between groups were significant difference at 24 months, since improvement was noted in 52% of group 1 and 32% in group 2 (p=0.032).By the end of 3 months of intervention minimal effect on performance within the HAQ $0,22 \leq \Delta HAQ \leq 0,36$ was observed in 80% of group 1, 78% in 2nd group and 76% in group 3 ($p > 0.05$), while not a single case was fixed not satisfactory or pronounced effect. By the end of 12 months, the dynamics of functional status was noticeable and patients in group 1 have prevailed a satisfactory effect within $0,36 \leq \Delta HAQ < 0.80$ - 48.75% (p=0.043 and p=0.048, respectively), so a marked effect within $\Delta HAQ \geq 0,80$ functional status - 15% (p=0.001; p=0.011, respectively). This trend continued and by the end of 24 and 36 months, as the group 1 compared with group 2 is almost 8 times (p=0.001) and group 3 2 times (p. =0.045) greater $\Delta HAQ \geq 0,80$ a marked effect.
Conclusions: The preventive and therapeutic interventions on the background correction of progesterone deficiency in RA patients in a general practice reliably delivers stable ACR 50 response (64%) and significantly improves the functionality of the joints in RA.

SAT0764-HPR RETROSPECTIVE STUDY ABOUT ASSOCIATION OF MENTAL AND SLEEP DISORDERS AMONG ADULTS WITH PAINFUL MUSCULOSKELETAL CONDITIONS

S. Abdul Latif[1], A. Abdel Zaher[2], K. Al Hassanein[3], M. Zaghloul[1], M.H. Salama[4], E. Barakat[1], E. Mohamed[3], A. Shaky[3]. *[1]Rheumatology, Saudi German hospital, Jeddah; [2]Rheumatology, Saudi German hospital, Medinah; [3]Rheumatology, Saudi German hospital, Riyadh, Saudi Arabia; [4]Rheumatology, Thumby Hospital, Dubai, United Arab Emirates*

Background: Chronic pain is a common condition that affects one-third of the population, accounting for a large number of medical consultations and a significant proportion of health care costs.
Evidence suggests that anxiety and depression are associated with increased pain sensitivity and pain-related disability, co-morbid states that are more disabling than either condition alone.
Likewise, sleep disorders have also been linked with chronic pain, and people who experience pain-related sleep disturbances are significantly more disabled than those who do not.
Objectives: The objective of this study was to determine the prevalence of anxiety, depression, and sleep disorders, painful musculoskeletal conditions in a sample of adults with disabilities.
Methods: This cross-sectional study analyzed data of 1692 adults aged 18 or older who have disabilities over 10 years (2005 to 2014). We examined the following chronic conditions, in which pain is a key symptom and forms part of the diagnosis, and organized them into 3 groups. Group 1 consisted of (rheumatic diseases), arthritis, osteoarthritis, rheumatoid arthritis, and ankylosing spondylitis; group 2 consisted of muscular dystrophy; and group 3 consisted of neck or back pain;
The prevalence (95% confidence interval) of painful musculoskeletal conditions was determined according to the diagnosis. Factors associated with these painful conditions were analyzed separately for men and women by using a logistic regression model.
Results: The prevalence of painful musculoskeletal conditions was 66.9% (95% CI, 66%–67.5%). Factors associated with these conditions in both men and women included older age, a sleep disorder, and concomitant chronic anxiety and/or depression was 23.5% (95% CI, 22.5%–24%), all of which were higher in women than in men. Of the 1692 adults with disability included in the study, 65% were women. The average age was 50.5 (standard deviation, 12.5 y), and 65% of participants were 50.5 or older. In addition, 48% of participants were married. Of the participants, 16% had been diagnosed with chronic anxiety and 22% with chronic depression; and 32% with sleep disorder (sleeping 6 hours or less per day. Prevalence of Painful Conditions in Adults with Disabilities, by Group of Conditions and by Sex, Differences between men and women were significant at $P < .001$ (for all groups of conditions, except muscular dystrophy.
Conclusions: The prevalence of painful musculoskeletal conditions associated with depression, anxiety, and/or a sleep disorder, is high in people with disability, especially in women. To design plan for rehabilitation and improving the quality of life of adults with disability and painful conditions; treatments for depression, anxiety and/or sleep disorders should be considered in addition to conventional treatments.

SAT0765-HPR CRITERION AND CONCURRENT VALIDITY OF THE AMERICAN-ENGLISH VERSION OF THE FLARE QUESTIONNAIRE TO DETECT AND MEASURE FLARES IN RHEUMATOID ARTHRITIS

N. Barroso[1], T.G. Woodworth[1], F. Guillemin[2], D.E. Furst[1], J. Brook[1], S. Kafaja[1], N. Borazan[1], D.A. Elashoff[1], B.J. Fautrel[3], V.K. Ranganath[1]. *[1]Medicine, UCLA, Los Angeles, United States; [2]Université de Lorraine, Paris Descartes University, APEMAC, EA 4360; [3]Pitié Salpêtrière Hospital, Paris, France*

Background: Despite advances in rheumatoid arthritis (RA) therapeutic agents, difficulty in managing RA flares persists, and remission or the *persistent* absence of inflammation remains challenging to achieve. The French FLARE (F-FLARE) was developed to facilitate and standardize detection and measurement of RA flares between clinic visits.[1,2] We have previously reported the cognitive debrief for the published British English version, which determined that revision of wording and presentation of items was required. Here we report validation of the American English version of FLARE (Am-E FLARE-RA).[3]
Objectives: To assess whether the Am-E FLARE questionnaire performs comparably to the French version of FLARE in detecting RA flare in an American English-speaking clinic population.

Methods: We enrolled patients attending UCLA rheumatology clinics. After informed consent, patients completed a questionnaire to collect demographics, Am-E FLARE, RAPID3, patient global visual analog scale (VAS), and self-reported flare at time of visit or between visits (yes/no). Questionnaires were provided to patients without specific instruction. From the electronic medical records, we extracted MD global VAS, MD-reported flare, seropositivity, disease duration, swollen/tender joint counts (SJC/TJC), and calculated the clinical disease activity index (CDAI). Analyses included Wilcoxon rank sum tests and Spearman correlations to assess criterion and concurrent construct validity.

Results: Eighty-five RA patients diagnosed by the1987 American College of Rheumatology (ACR) criteria enrolled in our study. For the study population as a whole, mean age was about 50 years and most were female. Mean disease duration was about 10 years and about 65% were seropositive. (see Table). Am-E FLARE scores were significantly higher in patients' self-reporting flare compared to patients who reported no flare (p=0.005), and also for patients with MD-reported flare compared to those without flare (p=0.008) (see Table). Interestingly, there were no significant differences in SJC (p=0.82) and physician global (p=0.19) between patients who self-reported flare versus those who reported no flare. In addition, the Am-E FLARE scores correlated moderately with both CDAI (corr=0.46) and RAPID3 (corr=0.57).

Table 1. Patient and MD Assessment of Flare

	Patient-reported FLARE			MD-reported FLARE		
	No Flare Mean (SD)/ N (%) n=51	Flare Mean (SD)/ N (%) n=34	*p-value	No Flare Mean (SD)/ N (%) n=67	Flare Mean (SD)/ N (%) n=18	*p-value
Age	52.37(15.62)	47.15(16.29)	0.15	51.73(16.09)	44.89(14.87)	0.08
Female	46(90.20)	31(91.18)	0.88	60(89.55)	17(94.44)	0.53
Race#

CDAI	17.49(13.48)	22.88(13.03)	0.03	16.74(11.54)	30.11(15.19)	0.0003
TJC	6.29(6.67)	8.91(7.24)	0.04	6.25(6.36)	11.39(7.85)	0.005
SJC	4.67(4.94)	4.56(3.96)	0.82	3.96(3.88)	7.11(5.94)	0.005
Patient Global	3.33(2.39)	5.15(2.33)	0.001	3.45(2.32)	6.22(2.02)	<.0001
Physician Global	3.20(2.08)	3.85(2.24)	0.19	2.94(1.92)	5.39(1.91)	<.0001
FLARE Total	4.80(3.32)	6.88(2.01)	0.005	5.18(3.07)	7.31(2.27)	0.008
FLARE Physical	5.11(3.47)	7.28(2.02)	0.008	5.49(3.21)	7.81(2.10)	0.005
FLARE Emotional	4.48(3.47)	6.49(2.61)	0.007	4.88(3.33)	6.81(2.71)	0.03

CDAI = Clinical Disease Activity Index; RAPID3 = Routine Assessment of Patient Index Data; TJC = Tender Joint Count; SJC = Swollen Joint Count; Seropositivity = either CCP+ or RF+; *Wilcoxon rank sum test; #Race and Seropositivity are presented as frequencies and present and p-values are calculated using Chi-square test

Conclusions: The Am-E FLARE is feasible for use in clinic, and shows good criterion validity, with scores significantly higher in patients who self-report flare. In addition, Am-E FLARE shows good discriminant validity, distinguishing patients who are flaring according to MD or patient self-report from those who are not. Finally, Am-E FLARE demonstrates construct validity comparable to that of the original French version of FLARE.

SAT0766-HPR THE FACTORS AFFECTING FUNCTIONAL ABILITIES IN PATIENTS WITH JUVENILE IDIOPATHIC ARTHRITIS

E. Tarakci[1], N. Arman[1], O. Kasapcopur[2]. [1]*Division of Physiotherapy and Rehabilitation, Faculty of Health Science;* [2]*Department of Pediatric Rheumatology, Medical Faculty of Cerrahpasa, Istanbul University, Istanbil, Turkey*

Background: Juvenile idiopathic arthritis (JIA) is the most common rheumatic disease in pediatric population and is characterized by a heterogeneous group of diseases that include chronic arthritis of unknown origin, which begins before 16 years of age (1). Patients with JIA commonly experience acute and chronic pain, decreased mobility, and joint stiffness leading to restrictions on functional ability and isolation from their peers (2).

Objectives: The aim of this study was to assess relationship between clinical features and functional ability and determine the factors affecting functional abilities in patients with JIA.

Methods: 172 (aged 5–18 years) with JIA were included in this study. Socio-demographic data, clinical features (duration of disease, subtype of JIA, and number of involved joint) and functional ability were assessed with Childhood Health Assessment Questionnaire (CHAQ). Pain and overall well-being were measured using a Visual Analog Scale (VAS). Relations between the factors affecting functional abilities in JIA were assessed by multiple linear regression analysis

Results: The mean age was 10.71±3.47 and the mean disease duration was 5.41±3.53 years. Score of CHAQ was affected by number of involved joint (β=0.18, $p<0.05$), subtypes of JIA (β=- 2.75, $p<0.01$) and pain (β=0.15, $p<0.05$), but were not affected by age (β=-0.03, $p>0.05$), gender (β=-0.03, $p>0.05$) and disease duration (β=0.03, $p>0.05$). In addition to, significant difference was found between all CHAQ subscores (except of "walking") of polyarticular and oligoarticular JIA ($p<0.001$). Functional abilities of patients with polyarticular JIA were lower than functional abilities of patients with oligoarticular JIA.

Conclusions: In the literature, it reported that functional activities were adversely affected in patients with JIA, when they compared with healthy subjects. In our study, we found that functional abilities were affected by subtypes of JIA, number of involved joint, and pain. But, these were not affected by age, gender, and disease duration in JIA. We suggest that subtypes of JIA, number of involved joint, and pain should be considered, when patients with JIA are directed to physical therapy program to encourage functional abilities.

SAT0767-HPR PHYSICAL ACTIVITY MAINTENANCE AND DIGITAL HEALTH INTERVENTIONS IN PEOPLE WITH RHEUMATOID ARTHRITIS: PATIENT AND HEALTHCARE PROFESSIONALS' PERSPECTIVES

R. Simmons[1], H. Lempp[2], J. Galloway[2], L. Bearne[1]. [1]*Division of Health and Social Care Research, Kings College London University;* [2]*The Academic Department of Rheumatology, Kings College London, London, United Kingdom*

Background: Physical Activity (PA) improves health and function in people with Rheumatoid Arthritis (RA) but people with RA commonly fail to meet recommended PA levels. Digital Health Interventions (DHIs) are delivered through digital media to facilitate behaviour change, such as maintaining PA. To date, little is known about the perceptions of people who have RA or their healthcare professionals (HCPs) about the factors that influence PA and the desirability and perceived suitability of using DHI to support PA maintenance.

Objectives: To explore RA patients' and HCPs' perceptions of the factors that influence PA maintenance as well as their views on the use of DHIs to support sustained PA.

Methods: Adults aged >18 years with established RA were recruited from two inner-city NHS hospitals. Semi-structured interviews, using a topic guide developed a priori, were conducted by one researcher either face-to-face or by telephone until data saturation of themes was reached. HCPs working at one NHS inner-city hospital, who self-reported >3 months experience managing RA patients attended one semi-structured focus group, facilitated by two researchers and informed by a topic guide.

The interviews and focus group were audio-recorded, transcribed verbatim and the data analysed thematically. Themes were corroborated by a sample of participants and an independent researcher.

Results: 11 patients were recruited between January-May 2016 (five females; mean age 58 years [standard deviation 17 years]). Five themes were identified from the interviews: 1) Balancing the benefits of activity with the costs; 2) Gaining knowledge about safe and effective PA; 3) Disease control; 4) The environment matters; and 5) Interaction of person, disease and DHI.

Patient participants were largely aware of the benefits of PA but wanted more information about safe PA. Ongoing PA was informed by participants balancing the benefits of PA with concerns about aggravating symptoms. Good symptoms control facilitated PA but severe and unpredictable symptoms and unsuitability of exercise facilities were perceived as barriers to PA maintenance. Patient participants mostly stated that DHIs were a desirable and acceptable adjunct to supporting PA maintenance.

The focus group was conducted with six HCPs (two physiotherapists, two rheumatologists, one podiatrist and one medical student). Two themes were identified 1) Inactivity demands a proactive response by HCPs and 2) DHIs have potential to support PA, but "there is no panacea".

HCP participants universally agreed that PA was beneficial and that it was important to support ongoing PA through education and multimodal interventions, including DHIs.

Conclusions: Disease control, knowledge and environmental factors influence PA maintenance in people with RA, who balance the perceived benefits with the potential costs of PA. HCPs recognise the need to proactively support PA maintenance. DHIs offer a potentially useful and acceptable tool to support PA maintenance.

SAT0768-HPR SUBJECTIVE COGNITIVE DYSFUNCTION AND COMPUTERIZED NEUROPSYCHOLOGICAL PERFORMANCE IN KOREAN ADULTS WITH RHEUMATOID ARTHRITIS

S.Y. Shin[1], J.H. Lee[2], B.Y. Yoon[2]. *[1]Department of Nursing, College of Medicine, Inje University; [2]Division of Rheumatology, College of Medicine, Inje University, Ilsan Paik Hospital, Busan, Korea, Republic Of*

Background: There is an increased appreciation of the burden of cognitive impairment in persons with rheumatoid arthritis (RA). Research shows a gap between subjective and objective measures of cognitive impairment in persons with chronic diseases.
Objectives: This study explored the relationship between subjective cognitive dysfunction and computerized neuropsychological performance in Korean older adults with RA.
Methods: Individuals with RA were recruited by their rheumatologists during follow-up visits at one university hospital in Korea. After getting signed consents, a trained research nurse assessed participants with a range of physical, psychosocial, and biological metrics. Subjective cognitive dysfunction was assessed using the Perceived Deficits Questionnaire (PDQ; range 0–20, higher score=greater impairment). Objective cognitive impairment was assessed using a set of 6 computerized neurocognitive tests yielding 18 indices covering a range of cognitive domains. Subjects were classified as "impaired" if they performed 1 *SD* below age-based population norms on each test [1]. A total cognitive impairment score was calculated by summing the transformed scores (range: 0–18, higher score=greater impairment). Multiple regression analysis controlling for education, disease severity, and depression was conducted to identify the relationship between objective and subjective cognitive measures.
Results: Fifty four subjects with a mean (±*SD*) age of 63.6 (±10.5) years were included in the final analyses. 85% were female and 87% were married. Mean educational level was 10.2 (±4.9) years and mean disease duration was 8.9 (±8.5) years. 25.9% had depression and 55.6% had sleep problem. Mean PDQ score was 11.8 (±4.5, range 5–25) and mean total cognitive impairment score was 11.0 (±4.1, range=2–18). 92% were classified as cognitively impaired on five or more test indices. There was no significant correlation between PDQ score and total cognitive function score (r=.260, p=.068). However, psychological factors including depression (r=.621, $p<.001$) and sleep problem (r=.577, $p<.001$) were significantly correlated with PDQ score. In the multivariate analysis, there was no significant relationship between PDQ score and total cognitive impairment score. However, functional limitations and depression (=0.317, p=0.048; =0.334, p=0.019) were significantly associated with the PDQ score.
Conclusions: There was no significant relationship between subjective cognitive dysfunction and computerized neuropsychological performance in this cohort. Functional limitations and depression were significantly associated with perceived cognitive dysfunction. Findings emphasize the gap between subjective and objective measures of cognitive impairment and the importance of considering psychological factors in the context of cognitive complaints in clinical settings.

SAT0769-HPR DO PATIENTS RECALL PHYSICAL ACTIVITY ADVICE? INTERVIEWS WITH UK INFLAMMATORY ARTHRITIS PATIENTS TO EXPLORE EXPERIENCES OF PHYSICAL ACTIVITY COMMUNICATION

V. Salmon[1], N. Walsh[2], E. Dures[2], A. Haase[3], M. Urban[4], F. Cramp[2]. *[1]University of Exeter, Exeter; [2]University of the West of England; [3]University of Bristol; [4]University Hospitals Bristol NHS Foundation Trust, Bristol, United Kingdom*

Background: Guidelines for managing inflammatory arthritis (IA) indicate that patients should be encouraged to be physically active. Patient perceptions of physical activity (PA) communication during routine rheumatology consultations, or whether they recall or understand PA information, are not known.
Objectives: 1. To explore patients' short-term recollection and interpretation of communication relating to PA during consultation with a rheumatology doctor or nurse
2. To explore patients' needs for effective PA communication
Methods: Adults with IA took part in semi-structured telephone interviews 2 to 3 days after their consultation with a rheumatology doctor or nurse. Transcripts were analysed using thematic analysis.
Results: 26 patients took part (18 female; age 35–83 years; disease duration 0.25–40 years). Preliminary analysis suggests five themes:
Patients recall little communication about PA: Few patients recalled PA communication during their appointment, although some discussed general lifestyle and some recalled discussions about PA or exercise in previous consultations.
Appointments focus on medical management: Patients mainly recalled discussing medical management of IA. Some were asked about general health and support needs, but assumed health professionals were interested in disease status and medication rather than lifestyle and wellbeing.
Patients are uncertain as to what constitutes PA: Some patients seemed confused by what constituted discussion about PA. Different interpretations were reported, with many participants referring to condition specific exercises rather than lifestyle PA. Few patients described PA as general movement or everyday activity.
Patients would like to discuss PA: Few patients initiated conversation about PA, but many would welcome PA communication from any health professional with appropriate knowledge. Several patients felt most comfortable discussing PA with a member of their rheumatology team rather than a non-specialist. A small number felt the rheumatologist's role related to medical management rather than lifestyle advice. Preferences for communication style included a direct, honest approach using lay language. It was felt that health professionals could do more to ask about and encourage PA, reassure about PA safety, and offer individualized support to enable appropriate PA.
Perceived barriers to undertaking PA must be considered: Some patients perceived barriers to PA, such as lack of knowledge and skills for PA, lack of time, work commitments and IA flares. It was felt important to acknowledge that it can be difficult to apply lifestyle changes in practice.
Conclusions: IA patients recalled little discussion about PA in routine rheumatology consultations. Patients may interpret questions about general health and exercise as relating to their disease status and joint function rather than to lifestyle or PA. Health professionals should ask direct questions about lifestyle PA and offer non-didactic, individualized advice and support. Further research is needed to understand PA communication from the perspective of rheumatology health professionals, including identification of opportunities and challenges for implementing effective communication.

SAT0770-HPR IS THE DUAL – TASK TRAINING BENEFICIAL ON THE CLINICAL OUTCOMES OF ELDERLY?

Y. Aydoğdu[1], O. Aydoğdu[2], S.H. İnal[3]. *[1]Department of Physiotherapy and Rehabilitation, Haydarpaşa Numune Hospital; [2]Department of Physiotherapy and Rehabilitation, Health Sciences Faculty, Marmara University; [3]Department of Physiotherapy and Rehabilitation, Health Sciences Faculty, Bahcesehir University, Istanbul, Turkey*

Background: The difficulties of elderly in performing two different tasks have been well documented (1). It has been reported that aging is associated with a decline in attention abilities and dual-task performances. Improving the ability to perform two different tasks simultaneously could therefore have significant impacts in the prevention of adverse outcomes associated with aging (2).
Objectives: Regarding specific dual-task training, recent studies have demonstrated its efficacy in various populations such as the elderly and individuals with neurological diseases, with the most notable improvements in gait. However, there is no evidence in the literature on the effects of this training on balance and clinical outcomes evaluated independently among elderly. Thus, considering the positive results of specific dual-task training obtained in other populations, we conducted a randomized trial to study the efficacy of an eight – week dual-task training program adjunct to conventional physiotherapy compared to a conventional physiotherapy program on balance, mobility, functional independence, fear of falling, functional capacity in elder individuals.
We hypothesized that, dual-task training is more effective at improving balance and clinical outcomes than conventional physiotherapy in elder individuals.
Methods: Fifty-five elderly were participated in our study. Balance, mobility, functional independence, fear of falling was measured with Berg Balance Scale, Rivermead Mobility Index, Functional Independence Measurement, and Fall Efficacy Scale-International, respectively. Functional capacity was assessed with Timed Up&Go, Chair Sit&Stand. Cases were divided into two different groups. Conventional Physiotherapy was applied in control group, and besides the same protocol, dual–task training was applied 5 days for 8 weeks in the intervention group. The dual–task training consisting of the cognitive activities included digit span, spelling words, stroop test, image description, counting, description of daily activities and routines was applied during the gait exercises. All of the assessments procedures were performed again after the treatment.
Results: There were statistically significant improvements in measures of balance, mobility, functional independence, fear of falling, and functional capacity between pre- and post – treatment in both groups ($p<0.05$). A significant difference was found in balance and mobility in favour of the intervention group (p=0.028).
Conclusions: Based on our findings, we found that dual–task training applied as an adjunct to conventional physiotherapy was superior to conventional physiotherapy on balance and mobility parameters. From this point of view, dual-task training should be considered as part of the rehabilitation process of elderly, although until now no guidelines have been defined for this type of intervention.

AB1195-HPR PSORIATIC ARTHRITIS PATIENTS INITIATED ON APREMILAST: A RETROSPECTIVE ANALYSIS OF PATIENT OUTCOMES FROM A WEST LONDON TEACHING HOSPITAL

C. Astbury. *Pharmacy, Imperial College NHS Healthcare Trust, London, United Kingdom*

Background: Apremilast is an oral phosphodiesterase 4 (PDE-4) inhibitor that reduces disease activity in psoriatic arthritis (PsA) by modulating the expression of inflammatroy cytokines. In December 2015, apremilast received a negative National Institute of Clinical Excellence (NICE) appraisal for its use in PsA, owing to a lack of robust evidence on its long-term impact on patient outcomes and efficacy in improving radiographic progression (TA372).
The role of the drug in the PsA treatment pathway remains uncertain. We present a retrospective analysis of the use of apremilast in 14 patients with PsA within our hospital trust.
Methods: Pharmcay funding applications and medication dispensing records were used to identify suitable patients. All patients commenced on apremilast at Imperial College NHS Healthcare Trust (ICHT) for PsA were included in the analysis.
Results: A total of 14 patients were initiated on apremilast between June 2015 and September 2016 (table1). Of these patients 9 (64%) achieved an adequate response to treatment, defined by NICE as an improvement in at least 2 of the 4 PsA response criteria (PsARC) scores, with no worsening in any of the four criteria.
Of the 5 patients not achieving response, 3 patients discontinued treatment prior to assessment due to intolerable side effects, whilst 2 further patients didnt acheive the appropriate therapeutic response (primary failure).
From the 9 patients that achieved an adequate response only 5 are currently taking therapy, with intolerable side effects causing discontinuation in a further 4. This gives an overall discontinuation rate of 65% (9 out of 14). In the 5 patients remaining on therapy, one patient needed to reduce the drug dose due to side effects, whilst one continued treatment despite tolerable side effects. Of our 14 patients only 3 remained on treatment in the absence of any side effects.
The most common side effects causing discontinuation were nausea and vomiting (3patients, 21%) and mood changes (2 patients, 14%).

Table 1. Patient demographics for all PsA patients initiated on apremilast (n=14). Median time to stopping treatment 4 months.

	Duration (years)	Erosive	Age	Sex	Psoriasis	Previous treatment		Concomitant csDMARD	Duration of treatment (months)	Side effects
						2x csDMARD	bDMARDs			
1	4	N	34	M	Y	Y	Y	Nil	14	Continues N+V but tolerable
2	13	Y	55	F	Y	Y	Y	SSC / HCQ	7	Stopped- primary failure
3	6	N	37	M	N	Y	Y	LEF	4	Stopped- N+V + hangover feeling
4	3	N	42	F	Y	Y	Y	SSZ	2	Responded but Stopped- N+V
5	12	Y	49	F	Y	Y	Y	HCQ / Pred	9	Responded but Stopped- Mood changes
6	22	Y	59	F	Y	Y	Y	MTX / SSC	6	Responded but Stopped- mood changes
7	9	Y	58	F	Y	Y	N	MTX	16	Continues
8	8	Y	62	F	Y	Y	Y	MTX	14	Continues
9	7	N	62	F	Y	Y	Y	SSZ	14	Continues - dose reduced
10	11	N	75	F	Y	Y	Y	MTX	1	Stopped- shingles
11	10	N	56	F	Y	Y	Y	MTX/SSZ	11	Continues
12	10	Y	77	F	N	Y	Y	LEF / Pred	1	Stopped- nausea
13	26	Y	44	F	N	Y	N	MTX	6	Stopped- primary failure
14	17	N	41	M	Y	Y	N	Nil	2	Responded but Stopped- Dizziness

Conclusions: Apremilast was poorly tolerated in our population with only 3 patients continuing the drug with response and without ongoing side effects. Discontinuation rates within ICHT were found to be much higher than those in the original trial data (65% versus 15%). Patients who have continued the medication and tolerated side effects, however have shown a good response to treatment.

AB1196-HPR A COMPARISON OF PATIENT PREFERENCE AND USABILITY BETWEEN TWO ELECTRONIC GONIOMETRIC GLOVES IN THE MEASUREMENT OF JOINT MOVEMENT IN PATIENTS WITH RHEUMATOID ARTHRITIS

D. Small[1], P.V. Gardiner[1], J. Connolly[2], J. Condell[2], K. Curran[2], A. O'Neill[1], R. Friel[1]. *[1]Rheumatology, WHSCT; [2]School of Computing, Ulster University, Londonderry, United Kingdom*

Background: Patients with Rheumatoid arthritis suffer from pain, stiffness and reduced mobility of their finger joints. Instrumented electronic goniometric gloves have been developed which can enable dynamic measurements to be made with accuracy and efficiency [1]. This technology could be employed in assessing patients with rheumatoid arthritis and could also be used as an aid to rehabilitation. However, pain and swelling in the joints might limit the applicability of these measurement devices as to date they have not been tested in this patient group.
Objectives: The purpose of this pilot study was to establish the usability of two different electronic gloves in patients with mild to moderate Rheumatoid arthritis. We wished to establish if patients experienced difficulty donning or doffing either glove or if carrying out a series of measurements with the gloves on caused a change in pain and stiffness. We also investigated differences in the usability and preference between the two Datagloves.
Methods: We compared a commercially available electronic glove (the 5DT dataglove 14 Ultra) with a bespoke IMU based electronic glove produced to our specifications by Tyndall National Institute, University College Cork (Figure). We developed a programming interface for both devices to facilitate calibration and detailed evaluation of joint movement. Nine patients with mild to moderate rheumatoid arthritis who were experiencing significant but not severe pain and early morning stiffness in their hands were recruited. After calibration, the patients worked through a protocol of finger flexion and extension movements, which were repeated for each glove and again to test repeatability. The patients completed questionnaires before and after using the gloves on their pain and stiffness levels and at the end of the session on glove donning and doffing usability and preference between the two gloves.
Results: All nine patients were able to don and doff the IMU glove without any difficulty compared to 4/9 for the 5DT glove. Seven of 9 patients expressed a preference for the IMU glove. In 2/9 patients, joint stiffness increased after using the gloves and 4/9 patients reported an increase in pain. Seven out of nine patients were not able to complete the fourth set of movement tests because of discomfort.

Table of Change in Stiffness and Pain after glove use and subject glove preference

Subject	Hand stiffness		Change in in stiffness (VAS)	Hand pain		Change in in pain (VAS)	Preferred Glove IMU or 5DT
	Pre Study (VAS)	Post study (VAS)		Pre study (VAS)	Post study (VAS)		
S1	15	22	NC	27	33	NC	IMU
S2	59	40	–	51	73	+++	IMU
S3	65	61	NC	71	79	NC	IMU
S4	28	28	NC	11	15	NC	5DT
S5	0	44	+++	0	49	+++	IMU
S6	26	77	+++	15	82	+++	IMU
S7	36	34	NC	16	33	+	IMU
S8	0	0	NC	0	0	NC	IMU
S9	25	15	NC	9	19	NC	5DT

+ >10mm increase in VAS; – >10mm decrease in VAS, NC <10mm change in VAS.

Conclusions: Electrogoniometric gloves are usable in patients with rheumatoid

arthritis, but patients cannot tolerate longer protocols without an increase in discomfort.

AB1197-HPR VALIDITY AND RELIABILITY OF A SMARTPHONE GONIOMETER APPLICATION FOR MEASURING HIP RANGE OF MOTION IN PATIENTS WITH HIP OSTEOARTHRITIS: A PILOT STUDY

D.C. Sarac[1], G. Yalcinkaya[2], B. Unver[2]. *[1]Division of Physiotherapy and Rehabilitation, Katip Celebi University; [2]School of Physical Therapy and Rehabilitation, Dokuz Eylül University, Izmir, Turkey*

Background: Osteoarthritis (OA) of the hip affects the entire joint structure and function and leads joint capsular changes which result limitation in range of motion (ROM). Therefore, measuring ROM is an essential part of the hip assessment. Various measurement tools are available for determining the ROM such as universal goniometers (UG), digital inclinometers, motion analysis systems. Recently, smartphones equipped with suitable applications are able to measure ROM.

Objectives: The aim of this study was to determine the inter-rater and intra-rater reliability of a smartphone application "PT Goniometer© 2015 Mark Busman" (PTG) and investigate the agreement within PTG versus UG for active hip ROMs in patients with hip OA.

Methods: This study included eight people who were diagnosed with hip OA. Two physiotherapists performed the ROM measurements on affected hips by using PTG and UG. UG was employed as the reference standard. Hip ROM tests were performed in the following order; flexion, abduction, internal and external rotation. Intraclass correlation coefficient (ICC) models were used to determine the intra-rater and inter-rater reliability. The Spearman correlation coefficients were used to establish validity of PTG.

Results: The PTG smartphone application demonstrated good to excellent inter-rater and intra-rater reliability (ICCs >0.75) for all measured hip movements in patients with hip OA. ICC scores, minimum detectable change (MDC_{95}) and standart error of measurement (SEM) values were indicated in Table 1 and Table 2. Additionally,UG and PTG application methods demonstrated positive correlations for all hip movements ($p<0.05$).

Table 1. Inter-rater Reliability of the PT Goniometer Application

Movement	PT 1, PTG (Mean ± SD)	PT 2, PTG (Mean ± SD)	ICC (%95 CI)	SEM	MDC_{95}
Flexion	66.18°±28.87°	63.66°±30.74°	0.99 (0.94–1.00)	0.91	2.52
Abduction	27.98°±12.93°	29.58°±13.03°	0.99 (0.90–0.99)	0.4	1.1
IR	10.86°±10.66°	11°±10.67°	0.99 (0.99–1.00)	0.33	0.91
ER	20.12°±11.74°	21.06°±12.5°	0.99 (0.96–1.00)	0.33	0.91

PT1: Physiotherapist1, PTG: PT Goniometer application, PT2: Physiotherapist 2, ICC: Intraclass correlation coefficient, CI: Confidence Interval, SEM: Standard Error of Measurement, MDC_{95}: Minimum Detectable change at the %95 confidence level, SD: Standard deviation, IR: Internal rotation, ER: External rotation. Table 2. Intra-rater Reliability of PT Goniometer Application

Movement	PT 1, PTG (Mean ± SD)	PT1, RT PTG (Mean ± SD)	ICC (%95 CI)	SEM	MDC_{95}
Flexion	66.18°±28.87°	65.64°±28.58°	0.99 (0.97–0.99)	0.91	2.52
Abduction	27.98°±12.93°	28.58°±13.61°	0.99 (0.98–1.00)	0.4	1.1
IR	10.86°±10.66°	10.96°±10.73°	0.99 (0.99–1.00)	0.33	0.83
ER	20.12°±11.74°	20.46°±11.96°	0.99 (0.98–1.00)	0.37	1.02

PT 1: Physiotherapist 1, PTG: PT Goniometer Application, RT PTG: Retest PT goniometer application, ICC: Intraclass correlation coefficient, CI: Confidence Interval, SEM: Standard Error of Measurement, MDC_{95}: Minimum Detectable Change at the %95 confidence level, SD: Standard deviation, IR: Internal rotation, ER: External rotation.

Conclusions: High correlations obtained in this pilot study suggest that using a smartphone application might be a valid and a reliable method for measuring hip ROM in patients with hip OA and smartphone applications can be used in clinical settings. Studies with larger population are required for further investigation of smartphones' psychometric properties on measuring hip ROM.

AB1198-HPR PRESENTATION OF A NEW SCALE ASSESSING THE BIOPSYCHOSOCIAL ASPECTS OF HEALING PROPERTIES IN RHEUMATIC PATIENTS

E. Ünal[1], P. Kısacık[1], G. Arin[1], E. Karabulut[2], D. Göksülük[2], N. Vardar Yağlı[1], D. Aydın Özcan[1], U. Berberoğlu[1], N.B. Karaca[1], A. Akdoğan[3], Ö. Karadağ[3], U. Kalyoncu[3], L. Kılıç[3], A. Erden[3], S. Apraş Bilgen[3], S. Kiraz[3], A.I. Ertenli[3], M. Çalgüneri[3]. *[1]Department of Physiotherapy and Rehabilitation, Hacettepe University Faculty of Health Science;[2]Department of Biostatistics; [3]Department of Internal Medicine, Rheumatology Subdivision, Hacettepe University, Ankara, Turkey*

Background: Exercise programs have been being provided in Hacettepe University for 12 years. The group exercises were transformed into a book named as "Bilişsel Egzersiz Terapi Yaklaşımı (BETY) (1)" in 2014 and were registered as a trademark by the Turkish Patent Institute in 2015. This approach includes cognitive processes in pain management, clinical pilates exercises and awareness of mood state via dance therapy (2).When rheumatic patients participating in BETY sessions, they are evaluated with appropriate scales for their diseases and it is stated that these scales do not express enough the healing properties they feel with BETY.

Objectives: The aim was to develop a new scale assessing the biopsychosocial aspects of healing properties in rheumatic patients.

Methods: After 12 years of treatment, cognitive beliefs about health perceptions were gathered from the patients who participates in the BETY group for at least 5 years, with the open-ended question "What kind of changes did you make in this group?". After elimination of similar sentences, 30 cognitive beliefs about different health perceptions were obtained. The newly developed scale was applied to 89 patients aged 18–69 years (42,94±12.85), who had different rheumatic diseases and were not included in the BETY group. Working questions were determined.

Results: The internal consistency was found to be 0.89. In this process, 5 items that didn't work and had the same meaning were removed from the scale. After this, "What kind of improvements did you make in Daily life by participating in the BETY group?" question was asked to the patients participated in BETY group to narrow the expressions and 5 new sentences are determined. The scale was sent to 24 rheumatologists and 2 physiatrists for expert opinion. 15 rheumatologists and 1 physiatrist were returned. When the survey items were examined on a question-based basis, the acceptance rate of all questions was 70.83%. According to this result, the scale was finalized. Structural validity of the created draft will be investigated in the subheadings of functional activity, pain, sexual life, fear of movement, mood.

Conclusions: As a result, an original scale which will assess the biopsychosocial aspects of healing properties in rheumatic patients is developed. Our future purpose is to investigate the validation of this scale in different rheumatic diseases.

AB1199-HPR IMPROVING TRIAGE TO APPROPRIATE TREATMENT LEVEL BY USING A COMBINATION OF SCREENING TOOLS IN PATIENTS AT RISK OF DEVELOPING CHRONIC BACK PAIN

E. Haglund[1,2], C. Olsson[3], A. Bremander[1,2,4], S. Bergman[2,3,4]. *[1]School of Business, Engineering and Science, Halmstad Univeristy; [2]Spenshult Research and Development Center, Halmstad; [3]Primary Health Care Unit, Department of Public Health and Community Medicine, Institute of Medicine, The Sahlgrenska Academy, University of Gothenburg, Gothenburg; [4]Department of clinical Sciences, Lund, Section of rheumatology, Lund University, Lund, Sweden*

Background: The screening instrument STarT (Subgroups for Targeted Treatment) Back Screening Tool (SBST) identify patients at risk of developing chronic back pain in order to facilitate triage to appropriate treatment level. The SBST takes into account known risk factors such as activity limitations, kinesiophobia and psychological health. However, SBST does not consider pain distribution which is a known predictor of chronic widespread pain (CWP). According to evidenced clinical practice patients with CWP should be referred to multimodal rehabilitation (1).

Objectives: The purpose of the study was to compare screening by SBST with screening of multisite chronic widespread pain (MS-CWP) in a group of patients with back pain and to analyze to what extent the two screening methods identify the same patients at higher risk.

Methods: 73 individuals with a report of chronic back pain ($\geq$3 months during last year) age 40–70 years responded to both screening tools. The SBST stratify patients into low, medium or high risk groups. A pain mannequin was used to categorize patients into no chronic pain (NCP), chronic regional pain (CRP) or chronic widespread pain (CWP) and number of painful areas (0–18). A presence of a CWP in combination with $\geq$7 painful areas was stratified as MS-CWP. The outcome of the different screening tools was analyzed by cross tabulations. The Roland-Morris Disability Questionnaire (RMDQ, 0–24), health related quality of life (EQ5D, 0–1), Fear-Avoidance Beliefs Questionnaire about physical activity (FABQ-PA, 0–24) and work (FABQ-Work, 0–42), Hospital Anxiety (HAD-A, 0–21) and Depression scale (HAD-D, 0–21) were used to describe physical function, health related quality of life, kinesiophobia and mental health.

Results: The mean (SD) age was 59 (8) years, 63% were women. Self-reports of physical function (RMDQ) were 4.5 (4.8), health related quality of life (EQ5D) 0.71 (0.21), kinesiophobia (FABQ-PA and FABQ-Work) 8.3 (5.9) and 14.7 (11.1), and mental health (HAD-A and HAD-B) 8.8 (2.0) and 4.5 (1.7). Comparing the different screening methods, 5 patients (7%) were at high risk as captured by SBST while using the pain mannequin 38 (52%) patients had CWP and 22 (30%) had MS-CWP. No patients in the SBST high risk group had NCP, but 31 (50%) in the SBST low risk group reported CWP, and 16 (26%) reported MS-CWP. In the medium risk group 3 reported CWP, and 3 were also categorized as MS-CWP.

Table 1

Pain distribution groups	StarT Back Screening Tool		
	Low risk	Medium risk	High risk
No chronic pain (NCP)	7	1	0
Chronic regional pain (CRP)	24	2	1
Chronic widespread pain (CWP)	31	3	4
No multisite - CWP	46	3	2
Multisite - CWP (high risk)	16	3	3

Conclusions: SBST and the pain mannequin as screening tools partly capture different patients at high risk of developing chronic back pain. Using a combination of the two instruments may improve the ability to facilitate triage to appropriate treatment level.

AB1200-HPR THE RELIABILITY OF ROMANIAN ROLAND MORRIS DISABILITY QUESTIONNAIRE IN PEOPLE WITH LOW BACK PAIN. A PRELIMINARY STUDY

E. Ilie, L. Rusu. *Faculty of Physical Education, Department of Sports Medicine and Kinesiology, University of Craiova, Craiova, Romania*

Background: Patient reported assessments are widely recommended by the clinical guidelines and an important part of a comprehensive assessment. Patient-reported questionnaires should be translated into local language accordingly and validated in the translated language (1). The clinicians in Romania suffer from lack of validated questionnaires in Romanian language. The Roland Morris Disability questionnaire is one of the most recommended questionnaires evaluating low back pain. Although, the Romanian translation was performed before, there is no effort regarding to its validation in Romanian language until now.

Objectives: To investigate the test-retest reliability Romanian version of the Roland Morris Disability Questionnaire (RMDQ-Ro) in people low back pain.

Methods: The permission to conduct such a study was asked to the original author Prof. Martin Roland, before starting to the study. The Romanian translated form of Roland Morris Disability Questionnaire which is provided on the web site "http://www.rmdq.org/" was used in the study. A total of 100 people with low back pain filled the RMDQ as well as Numeric Rating Scales for rest (NRS-R) and activity (NRS-A). Due to the lack of other validated measures such the Oswestry Disability Index in Romanian, these additional assessments (VAS-R and VAS-A) were performed for investigating convergent validity. For test-retest reliability 30 people filled the RMDQ-Ro after 3–14 days later as recommended. Test-rest reliability was assessed with intra-class coefficient correlation (ICC). Non-parametric tests were employed due to the heterogeneity of the data. Therefore, the Spearman correlation test was used for determining the relationship between RMDQ-Ro and VAS-R and VAS-A.

Results: The characteristics of the participants were shown at Table 1. The test-retest reliability of RMDQ-Ro was found at an excellent level (ICC: 0.95). Moderate positive correlations were determined between RMDQ-Ro and NRS-R (rho: 0.518, $p<0.001$), and NRS-A (rho: 0.484, $p<0.001$).

Table 1. Characteristics of the Participants

	Male (n: 52) Median (IQR 25/75)	Female (n: 48) Median (IQR 25/75)	Total (n: 100) Median (IQR 25/75)
Age (years)	32 (28.25/46.50)	35 (28.5/45.5)	34.5 (28.5/46)
Height (cm)	179.50 (175/183)	168 (163/170.5)	174 (168/180)
Weight (kg)	81 (72/90)	61 (55.5/61)	71 (61/81.5)
RMDQ-Ro (0–24)	6 (3/8)	4 (3/7)	5 (3/7)
NRS-R (0–10)	3.5 (2/5)	3.5 (2/5)	3.5 (2/5)
NRS-A (0–10)	2 (1/5)	3 (1/6)	2 (1/5)

IQR: Interquartile Range, RMDQ-Ro: Romanian Version of Roland Morris Disability Questionnaire, NRS-R: Numeric Rating Scale in Rest, NRS-A: Numeric Rating Scale in Activity.

Conclusions: RMDQ-Ro was found reliable regarding test-retest reliability. This questionnaire can be performed in the repeated measures for evaluating low back pain patients. However, more psychometric characteristics of RMDQ-Ro such as internal consistency and construct validity should be investigated in further studies.

AB1201-HPR THE VALIDITY AND TEST-RETEST RELIABILITY OF THE TURKISH PATIENT SPECIFIC FUNCTIONAL SCALE IN CHRONIC NECK PAIN PATIENTS. A PRELIMINARY REPORT

G. Yalcinkaya[1], B. Kara[1], M.N. Arda[2]. *[1]School of Physical Therapy and Rehabilitation; [2]Department of Neurosurgery, Dokuz Eylül University, Izmir, Turkey*

Background: Current clinical guidelines recommend to use both clinical and self-reported measurements for evaluation of chronic neck pain. Among the self-reported outcomes, Neck Disability Index (NDI) and Patient Specific Functional Scale (PSFS) are the most widely used and recommended instruments.[1] Although, NDI was validated in Turkish language before, no validation study related to the PSFS was detected in the literature.

Objectives: The aims of this study were to translate PSFS in Turkish language and to establish the test-retest reliability and validity of the PSFS-T in chronic neck pain patients.

Methods: The PSFS was translated into Turkish by using the "translation-backward translation" method as recommended in the guidelines.[2] The demographic information, PSFS-T and NDI were recorded at the first visit of the patients. Thirty patients were called by phone for the retest evaluation of PSFS-T. The construct validity of PSFS-T was determined by investigating the correlation between NDI and PSFS-T scores. The Cronbach's alpha was used for the internal consistency. Intra-class coefficient (ICC) was employed to determine the test-retest reliability.

Results: The final form was completed by 42 chronic neck pain patients (18 F) until now. The mean age was 42±14. The internal consistency was found as good (Cronbach's alpha:0.89). A positive moderate correlation was determined between NDI and PSFS-T scores ($p<0.05$;$r=0.405$). The ICC for test-retest reliability was determined in high level (ICC: 0.88).

Conclusions: The PSFS-T is a reliable and valid instrument for chronic neck pain patients. However,the preliminary results should be confirmed by completing the study.

AB1202-HPR RELATIONSHIP OF WORK DISABILITY BETWEEN THE DISEASE ACTIVITY, DEPRESSION AND QUALITY OF LIFE IN HOUSEWIFE AND WORKING PATIENTS WITH RHEUMATOİD ARTHRITIS

S. Sağ, K. Nas, M.S. Sağ, I. Tekeoğlu, A. Kamanlı. *Department of Physical Medicine and Rehabilitation, Rheumatology, Faculty of Medicine, Sakarya University, Sakarya, Turkey, sakarya, Turkey*

Background: The aim of this study was to determine the work status in patients with rheumatoid arthritis (RA) while also defining the factors related to work disability.

Objectives: In this study, our objective was to determine the work productivity, work disability and difficulty in time-off daily activities of the housewife and working patients with rheumatoid arthritis (RA) and to investigate the relation of these parameters with disease activity, anxiety, depression and quality of life.

Methods: 82 patients with the diagnosis of RA (26 males, 56 females) and 29 healthy control subjects (5 males, 24 females) were included in the study. In patients with RA, DAS28 was used to evaluate the disease activity; Duruöz hand index was used to determine the functional status. In addition, HAQ (Heath assesment quality) and The Short Form (SF-36) Health Survey was used to evaluate the health status, Hospital Anxiety and Depression Scale (HADS) was used for the evaluation of depression and anxiety and Work Productivity and Activity Impairment Questionnaire: Specific Health Problem v2.0 (WPAI:SHP) was used to evaluate the work productivity.

Results: Demographic characteristics such as age and gender, were comparable in both patient and control groups ($p>0.05$). The difficulty in the time off daily activities were worse in the patient group compared with the control group ($p<0.05$). Anxiety, were significantly higher in housewife RA group ($p<0.05$). Difficulty in time-off daily activities was correlated with VAS-fatigue and DAS28,HAQ,Duruöz hand index was correlated. ($p<0.05$).

Conclusions: Even if they are not working in housewives, we have found that

as much as the least active RA patients, it is difficult for activities in daily life, that the quality of life associated with the illness is low, and that depression and anxiety are similar to employees. As a result, disease activity, quality of life and functional status control in RA patients are as important as those who are working as housewives. Particularly in increasing productivity and participation in everyday life, the mood is influential and physicians must examine their patients in this regard. There is a need for more extensive cohort studies on this topic.

AB1203-HPR COMPARISON OF QUALITY OF LIFE OF PATIENTS WITH RHEUMATOID ARTHRITIS, PSORIATIC ARTHRITIS AND ANKILOSING SPONDILITIS WITH TREATMENT OR PRESCRIPTION OF BIOLOGIC DRUGS: RESULTS FROM THE CARA STUDY

L. Sinigaglia[1], L. Scalone[2,3], P. Sarzi-Puttini[4], C.M. Montecucco[5], R. Giacomelli[6], G. Lapadula[7], I. Olivieri[8], A. Giardino[9], G. Didoni[9], P. Cortesi[2,3], L.G. Mantovani[2,3], M. Mecchia[9] on behalf of CARA study working group. *[1]Rheumatology Unit, G. Pini Hospital; [2]CHARTA Foundation, Milano; [3]University of Milano Bicocca, Monza; [4]Rheumatology Unit, L. Sacco University Hospital, Milano; [5]University of Pavia School of Medicine, IRCCS Policlinico San Matteo Foundation, Pavia; [6]Rheumatology Unit School of Medicine, University of L'Aquila, L'Aquila; [7]Rheumatology Unit, University of Bari, Bari; [8]San Carlo Hospital of Potenza and Madonna delle Grazie Hospital of Matera, and the Basilicata Ricerca Biomedica (BRB) Foundation, Italy, Potenza and Matera; [9]MSD Italia, Roma, Italy*

Background: Chronic rheumatic conditions such as rheumatoid arthritis (RA), ankylosing spondylitis (AS), and psoriatic arthritis (PsA) are associated with severe morbidity and significant impairment of patients' health related quality of life (HRQoL). Several treatments are available but not all the patients respond positively to them. Biologic therapies such as anti-TNFα agents are shown to benefit who fail or have partial responses to standard DMARD therapy.
Objectives: Within a multicenter stated preferences study (CARA Study), we assessed HRQoL in patients with RA, AS and PsA, and estimated relationship of HRQOL with the different diagnoses, clinical characteristics and biological treatment experience.
Methods: Patients with RA, AS, or PsA, who at the time of enrollment were following a treatment (experienced) or received a first prescription (naïve) of treatment with biological drugs were enrolled. Together with preferences data, clinical and HRQOL information was reported. HRQoL was assessed with the recently developed and successfully validated version of the EQ-5D-5L, which allows to obtain a description of health (in 5 domains and 5 levels of severity each), a measure (EQ-VAS) and a valuation (utility) of health. Multiple linear regression analyses were conducted to assess the association between EQ-5D VAS score and the utility with age, sex, diagnosis, treatment experience, years from symptoms onset and years from diagnosis.
Results: 513 patients were enrolled (mean±SD =50.0±13.6, 42.5% female). As regards the diagnosis, 33.9% had RA, 34.9% PsA and 31.2% AS. The mean±SD time from the symptoms onset was 10.8±9.4 and from the diagnosis was 8.0±8.2 years. Almost half of the patients (47.4%) were naïve to the biological treatment. Patients reporting severe or extreme problems were: 7.1% in mobility, 3.6% in self-care, 10.3% in usual activities, 18.6% in pain/discomfort, 5.5% in anxiety/depression. The mean±SD of the VAS was 60.4±20.5 and of the utility was 0.773±0.116. From the regression model the VAS and utility are significantly ($p<0.05$) associated with age, sex and treatment experience (table 1). In particular, the patients being naïve to the treatment with biological drugs had on average significant worse levels of HRQoL than experienced patients, adjusting for the other variables included in the model.

Table 1. Results of the regression analyses

Varibles	EQ-5D VAS		EQ-5D UTILITY	
	Coeff. Regr	p-value	Coeff. regr	p-value
Constant	92.455	0.000	0.954	0.000
Age	-0.205	0.002	-0.001	0.013
Gender (Female)	-7.473	0.000	-0.055	0.000
Psoriatic arthritis	-3.986	0.063	-0.009	0.448
Ankylosing spondylitis	-4.236	0.076	-0.016	0.228
Naïve patients	-13.873	0.000	-0.074	0.000
Time from symptoms onset	-0.105	0.557	0.000	0.858
Time from diagnosis	0.061	0.768	0.000	0.815

Conclusions: Patients naïve to biological treatment have significat lower levels of HRQoL, suggesting that their current situation is not satisfactory and need to start with a more effective treatment.

AB1204-HPR EVALUATION OF CARBOHYDRATE METABOLISM IN RHEUMATOLOGIC PATIENTS AFTER PULSE THERAPY WITH GLUCOCORTICOIDS

M. Salokhiddinov, A. Tulabaev. *Rheumatology, Tashkent Medical Academy, Tashkent, Uzbekistan*

Background: Chronic inflammation – the crucial pathogenic mechanism of rheumatoid arthritis is the main cause of accelerated atherosclerosis, insulin resistance and well-known consequences related to it. The conservative treatment of rheumatoid arthritis may provide a significant influence on glucose metabolism. When the duration of rheumatic diseases of administration and dosage of glucocorticoids (GC) are significant predictors of the development of impaired glucose tolerance and diabetes mellitus.
Objectives: To study the effect of pulse-therapy (PT) of the GC on the violation of carbohydrate metabolism in patients with rheumatic diseases
Methods: The study included 35 patients (7 men, 18 women) with a variety of rheumatic diseases (systemic lupus erythematosus - 23, systemic vasculitis - 12) between the ages of 18 to 68 years (mean age 42,3±14,43 years) and duration of disease from 6 months to 12 years (mean 3,55±3,36 years). Pulse-therapy of GK included intravenous prednisolone 600–1000 mg per day for 3 consecutive days (course dose of 1800–3000 mg). Oral glucose tolerance test (OGTT) was performed after the course.The first group included patients with a normal result of OGTT (glucose concentration of <7.8 mmol/L at 2 hours after taking 75 g of glucose). There were 23 patients in the first group at the age of 18 to 54 years (mean age 38.0±2.8 years). Patients of the second group level had OGTT was>7.8 mmol/L. This group included 12 people aged from 44 to 61 years (mean age 52,6±8,4 years). All patients underwent the measurement of blood glucose levels prior to PT, 2, 4, 6, 10, 24, 48 and 72 hours and after the PT
Results: All patients included in the study, after the PT session there was an increase in blood glucose levels with a peak at 4 hours after the start of administration - 12.2±0.82 in the first group, in the second to 21.95±0.25 mmol/l ($p<0,05$). Normalization of glucose levels in the first group of patients occurred within 1.75±0.18 days (1 to 3), whereas in the second - for 5,0±1,0 (3 to 5; $p<0,05$). During the OGTT the mean fasting blood glucose levels in patients with the first group was 4.49±0.12 mmol/l, and the second - 5,85±0,35 ($p<0,05$), after 2 hours - 6.0±0.21 and 10.0±1.5 mmol/l, respectively ($p<0,05$).
Conclusions: Application PT of GC in rheumatic patients causes blood glucose levels to change values, indicating the development of impaired glucose tolerance. Predictors of disorders of carbohydrate metabolism in these patients are high levels of glycemia during the PT more continuous glucose normalization indices after the course PT GC.

AB1205-HPR THE EFFECTS OF KINESIOTAPING ON JOINT POSITION SENSE AND POSTURAL STABILITY FOLLOWING FATIGUE PROTOCOL

O. Aydoğdu, Z. Sarı, U.S. Yurdalan. *Physiotherapy and Rehabilitation, Marmara University, Health Sciences Faculty, Istanbul, Turkey*

Background: Muscle fatigue is common in sports activities and has been shown to adversely alter proprioception, impair neuromuscular control, and increase the risk of injury. Kinesiotaping has recently gained popularity among sports professionals for its assumed injury prevention and performance enhancement (1). Two studies have reported conflicting findings with respect to the effects of KT on proprioception. Halseth et al reported that KT produced no significant change in the absolute error in ankle joint position sense (2). However, Chang et al reported that KT decreased the force sense error in grip strength measurements among 21 healthy college athletes (3). Thus, the current literature does not provide clear information about the effects of KT on proprioception. Although there are published articles about investigating KT on joint position sense and postural stability, the effects of KT is still unknown after muscle fatigue, to our knowledge.
Objectives: There is a lack of literature examining the KT on joint position sense and postural stability following fatigue protocol. Therefore, the aim of this study was to investigate the effects of KT on knee joint position sense and postural stability after muscle fatigue. It was hypothesized that KT applied on quadriceps femoris muscle would partially compensate for the proprioceptive and balance-related deficits caused by muscle fatigue.
Methods: Thirty – six healthy subjects were evaluated in the study. Knee joint position sense was assessed by Biodex System Pro 4 during active repositioning tests at the target angles of 30º, 50º and 70º of knee flexion in sagittal plane. Postural stability was assessed by Pedalo Sensamove® System in antero –

posterior and medio – lateral plane. Joint position sense and postural stability were assessed three times: during rest, following the fatigue protocol, and following the taping. The subjects were received a clinically-used fatigue protocol on a cycle ergometer. The Modified Borg's Rate of Perceived Exertion Scale has been used for fatigue determination.
Results: Joint position sense and postural stability were significantly decreased following fatigue compared to the condition during rest ($p<0.05$). However, no significant difference was found in terms of joint position sense and postural stability after taping compared to the condition following fatigue ($p>0.05$).
Conclusions: The hypothesis of this study, that KT could partially compensate for the proprioceptive and balance-related deficits induced by muscle fatigue, was not supported. According to the results of our study, we concluded that the subjects do not benefit from the use of KT for compensating joint position sense and postural stability in condition following fatigue.

AB1206-HPR ADAPTATION INTO SPANISH OF THE SCLERODERMA HEALTH ASSESMENT QUESTIONNAIRE (S-HAQ)

P. Quevedo[1], M.A. Rivero[1], N. Perez[2], H. Laborde[2], G. Earsman[1], M. Mayer[1], S. Papasidero[3], S. Julia[3], C. Zaffarana[4], R. Maldonado[5], M. Khoury[6], M. Lara[7], C. Castell[7], A. Curti[7], J.C. Barreira[1], V. Steen[8]. *[1]British Hospital; [2]Hospital de Clinicas José de San Martin; [3]Tornu Hospital; [4]Psychophysical Rehabilitation Institute (Irep), Buenos Aires; [5]Padilla Hospital, TUCUMAN; [6]Statistics, British Hospital, Buenos Aires; [7]Luis Lagomaggiore Hospital, MENDOZA, Argentina; [8]Georgetown University, Washington, United States*

Background: The *Health Assessment Questionnaire* (HAQ) is an instrument administered to patients to self-report functional status originally in rheumatoid arthritis (RA). In Argentina, it has been translated and validated for RA in 2004. For diffuse SSc, HAQ has been associated to morbidity and mortality.
Objectives: To adapt S-HAQ into Spanish and to assess its validity in SSc patients in Argentina.
Methods: S-HAQ was translated following a forward-backward translation procedure of the original English version, and transcultural adaptation was performed by a comprehension test reaching the final Spanish version. SSc patients that fulfilled ACR 80 criteria and early Systemic Sclerosis according to Le Roy and Medsger criteria were included. Patients with overlap were excluded. Cronbach's alpha and item-item item-total correlations were used to assess internal consistency. Construction validity was analyzed through factor analysis with Varimax rotation. Continuous variables were compared by t-test, Mann-Whitney or Kruskal-Wallis test, and categorical variables by chi-square or Fisher's test. A value of $p<0.05$ was considered significant.
Results: l9An adapted Argentine-Spanish version of S-HAQ was developed. One hundred patients were surveyed; 84% were female, mean age 54±12.8 years and disease duration 8.8±9.1 years. Limited SSc was more frequent (63%), followed by diffuse SSc (36%). Serologically, 89% were ANA positive, 27% had anti Scl 70 and 41% had anti centromere antibodies. Median Rodnan score (mRSS) was 9.8 (0–40.5) and median activity measured by EUSTAR was 1.25 (0–6). Median S-HAQ was 0.62 (0–2.5), Cronbach's alpha 0.89, and when removing questions one by one the coefficient decreased. Median VAS (visual analogue scale) was 0.57 (0–2.8). Factor analysis identified two factors for the S-HAQ: factor 1: dressing (0.61), arising (0.68), reach (0.63), and personal hygiene (0.70); factor 2: eating (0.68), grip (0.72), walking (0.49), usual activities (0.62). For questions, three factors were identified through VAS: factor 1: overall disease severity (0.63) and gastro-intestinal symptoms (0.57); factor 2: Raynaud's (0.66), digital ulcers (0.56); factor 3: respiratory symptoms (0.43). There was a statistically significant association between higher values of S-HAQ and higher values of mRSS (1.1±0.74 vs. 0.64±0.5 p=0.002) and also with seropositivity for anti-Scl 70 (p=0.003). Higher values of total VAS were associated to female gender (0.75±0.5 vs. 0.49±0.71, p=0.01). There was a significant association between S-HAQ and MEDSGER (p=0.04) and EUSTAR (p=0.03) scores; likewise, between VAS and MEDSGER (p=0.00) and EUSTAR (p=0.00) scores.
Conclusions: A Spanish version of S-HAQ was developed, showing an acceptable reliability and validity.

AB1207-HPR PATIENT SATISFACTION IN A RHEUMATOID ARTHRITIS SPECIALIZED CENTER

S. Henao[1], F. Rodriguez[2], P. Santos-Moreno[3], L. Villarreal[4], M. Cabrera[5], A. Malpica[6], D. Buitrago-Garcia[6]. *[1]Patient service; [2]Patient Program; [3]Rheumatology; [4]Psychology and processes; [5]Engineer and processes; [6]Epidemiology, Biomab, Center for Rheumatoid Arthritis, Bogota, Bogota, Colombia*

Background: According to the Beryl Institute's, patient experience (PX) is "the sum of all interactions, shaped by an organization's culture, that influence patient perceptions, across the continuum of care"; nowadays patient satisfaction is considered as one of the quality for performance in health systems (1). In order to provide a multidisciplinary quality care to patients with RA in centers of excellence (CoEs) under the coordination of a rheumatologist, provide comprehensive management of patients with this pathology, ensuring approachability to medical appointments and treatment, in order to get better clinical outcomes and improve patient safety and satisfaction of the health services provided.
Objectives: To measure levels of satisfaction of RA patients treated at a specialized center and to evaluate patient service.
Methods: In a RA specialized center during a 24 month period we performed a satisfaction survey in order to evaluate the health services provided. We evaluated the timing on attention, appointment assignment, information provided, the treatment received by the healthcare team, facilities among others. Patients evaluated the services provided in a scale from 1 to 4, were 1 was very bad, 2 regular, 3 good and 4 excellent. Descriptive epidemiology was performed for each variable presented.
Results: We collected 1125 surveys during 2015 and 2016, 45% considered to have a timely care, the mean of waiting time for an appointment was 9 min ± 8; regarding the appointment assignment 96% of the patients evaluated it as good or excellent (mean 3.5±0.7), 80% considered that the information provided was clear and useful, 90% reported to receive a kind and friendly treatment and to considered the facilities as good or excellent. When we evaluated the satisfaction regarding the health care team 50% of patients evaluated the rheumatologist, nurse, nutritionist, physical therapist, psychologist and physiatrist as good and 40% as excellent.
Conclusions: Although we found that our patients are highly satisfied, there is a large opportunity to improve our services. Also, this evidence can support further research projects in order to increase the patient's satisfaction.

HPR epidemiology and public health (including prevention)

AB1208-HPR PSORIASIS INDUCED BY TNF ANTAGONIST THERAPY. ANALYSIS OF 13 CASES

À. Martinez-Ferrer[1], A. Mateu Puchades[2], C. Vergara Dangond[1], M. Aguliar Zamora[1], L. Montolio[1], S. Santos[2], È. Valls Pascual[1], D. Ybáñez García[1], J.J. Alegre Sancho[1]. *[1]Rheumatology; [2]Dermatology, Hospital Dr Peset, Valencia, Spain*

Background: Tumor necrosis factor (TNF) antagonist drugs have been shown to be effective in different inflammatory arthropathies and autoimmune pathologies, including psoriasis. However, an unexpected side effect has been observed: the new occurrence or worsening of psoriatic lesions.
Objectives: The aim of this study is to describe the cases of induction or worsening of psoriasis in patients treated with TNF antagonist therapy in our center.
Methods: Retrospective observational study, review of cases of new or worsening psoriasis in patients with TNF antagonist at the University Hospital Dr. Peset from October 2008 to November 2016. A total of 13 cases were obtained.
Results: Thirteen patients, 8 females and 5 males with mean age 46 years (± 16). 38% of patients received treatment for Crohn's disease, 31% for rheumatoid arthritis (RA), 31% for psoriatic arthropathy (APs), 8% for ankylosing spondylitis (AE) and another 8% for psoriasis. Two patients were diagnosed of more than one pathology: Crohn's disease associated with APs and Crohn's disease associated with RA. Sixty one percent had no known personal history of psoriasis, in one of them the family history of psoriasis was recorded. Infliximab was used in 38.5% of cases, followed by adalimumab and golimumab in 23% each and etanercept in 15.4%. The mean latency time since drug introduction was 9.3 months (2–26). There were 12 cases of psoriasis and 1 case of pityriasis lichenoides (histologically confirmed). Lesion morphology included pustular psoriasis in 91%, scalp psoriasis in 25%, guttate lesions in 25%, plaque psoriasis in 8%, and inverse psoriasis in 8%; 58% experienced lesions of more than one type. There were no cases of nail, mucosal or erythrodermic psoriasis. The psoriasiform lesions resolved without interruption of TNF antagonist therapy in 53.85%. Of the 6 patients who required discontinuation, 3 patients were switched to another anti-TNF drug (adalimumab,

golimumab and certolizumab) and all 3 had recurrence of the lesions, in 2 patients the anti-TNF was replaced by a non-anti-TNF biological. Topical treatment was used in all cases, one patient also required systemic treatment with methotrexate.
Conclusions: TNF antagonist induced psoriasis is a well-described adverse event. Pustular psoriasis is the most frequent presentation. In most cases there is no personal or family history of psoriasis. Topical therapy may be effective but some patients require discontinuation of the drug. Skin lesions can reappear when switching to another anti-TNF drug.

AB1209-HPR THE PREVALENCE OF DENTAL AND SINUS INFECTION IN PATIENTS WITH RHEUMATOID ARTHRITIS BEFORE BIOLOGIC THERAPY INITIATION: USEFULNESS OF A SYSTEMATIC SCREENING?

C. Tawil, E. Descamps, M. Forien, A. Gardette, E. Palazzo, S. Ottaviani, P. Dieudé. *Rheumatology Department, Bichat Hospital, Paris, France*

Background: Introduction of the biologic therapies has dramatically improved the outcome of severe rheumatoid arthritis (RA). Biologic therapies play a central role in the control of synovial inflammation. However they also decrease host defenses leading to an increased rate of infection. Because of their adverse effects, a careful assessment is needed before their initiation. A systematic assessment of dental or sinus infection before a biologic therapy is not required.
Objectives: The aim of our study was to assess the prevalence and the usefulness of a systematic screening of oral (dental and/or sinus) infection of RA patients before biologic therapy initiation.
Methods: This was a monocentric retrospective study. We included RA (ACR/EULAR 2010 criteria) patients with active disease despite disease-modifying anti-rheumatic drugs (DMARDs) and requiring biologic therapy initiation between 2010 and 2016. The following parameters were collected: demographic and disease characteristics, disease activity (C-reactive protein, disease activity score (DAS) 28), currents therapies (DMARDS, corticosteroids). Dental infection was assessed by stomatologist after clinical and panoramic dental X- ray evaluation. Sinusitis was defined on sinus computed tomography as partial or complete opacification of one or more sinus cavities. Factors associated with oral infections were analyzed in uni- and multivariate models.
Results: We included 223 RA patients (79.4% of female, mean ± SD disease duration of 8.9±8.6 years). The mean age was 54±10.9 years, 70.8% rheumatoid factor (RF) positive, 84.4% anti–citrullinated protein antibody (ACPA) positive and 68.1% had radiographic damages. The mean DAS 28 was 5.5±2.6; 71% of patients received corticosteroids (mean 7mg per day of equivalent prednisone) and 63% methotrexate (mean 17.8mg per week). No patient had pain or other sinus or dental symptoms. Before biologic agent initiation, systematic dental and sinus screening revealed an oral infection in 31.5% of patients (dental: 20.2% and sinus: 14.8%). In univariate analysis, active smoking was associated with a higher risk of oral infection (OR=2.16 [1.02–4.57], p=0.038) and methotrexate with a lower rate (OR=0.43 [0.23–0.81], p=0.006). Corticosteroid, disease duration, DAS 28, RF, ACPA and structural damages were not associated with oral infection. No significant association was confirmed with oral infection using multivariate analysis.
Conclusions: In our study, one third of RA patients requiring biologic agents had asymptomatic oral infection. The high prevalence of oral infection in RA patients suggests the usefulness of systematic dental and sinus screening before biologic therapy initiation.

AB1210-HPR MENDELIAN RANDOMIZATION ANALYSIS INDICATES SERUM URATE HAS A CONDITIONAL CAUSAL EFFECT ON SERUM CREATININE AND RENAL FUNCTION

J. Liu[1], H. Zhang[1], Z. Dong[1], J. Zhou[1], Y. Ma[1], Y. Li[1], Q. Qian[1], Y. Yang[1,2], X. Wang[1,2], H. Zou[3,4], L. Jin[1,2], J. Wang[1,2,4]. *[1]State Key Laboratory of Genetic Engineering, Collaborative Innovation Center for Genetics and Development, School of Life Sciences, Fudan university, Shanghai; [2]Fudan-Taizhou Institute of Health Sciences, Taizhou; [3]Division of Rheumatology, Huashan Hospital, Fudan University; [4]Institute of Rheumatology, Immunology and Allergy, Fudan university, Shanghai, China*

Background: Uric acid, the weak organic acid and the end product of purine nucleotide degradation, is excreted predominantly by the proximal tubules [1]. Although large numbers of epidemiological, molecular and animal studies have focused on various pathogenic effects of serum uric acid, incldng chronic kidney disease (CKD), metabolic syndrome, and coronary artery disease [2], whether the serum uric acid is an independent risk factor or has causal impact on serum creatinine (SCr) and renal function remains unclear.
Objectives: We aim to study the effect of serum uric acid on renal function by applying the method of Mendelian randomization.
Methods: The study was represented by estimated glomerular filtration rate (eGFR) with potential confounding factors in 3,734 Chinese subjects. Four genetic variants of uric acid transporter genes (*rs1481012 [ABCG2], rs16890979 [SLC2A9], rs2231137 [ABCG2]* and *rs3799352 (SLC17A1]*) were selected for this study as they had highest correlation with serum uric acid in Chinese population in our previous study. In this research, serum uric acid was selected as exposure, genetic risk score of uric acid transporters was selected as instrumental variable, and SCr and eGFR were selected as the outcomes.
Results: 1) The results of the analysis showed that increased serum uric acid has a causal effect on reducing estimated glomerular filtration rate in both female population and the subjects who were under 65 years old. Because of protective effects on renal function of ovarian hormones such as estrogen, we postulated that estrogen might be the cause leading to the difference between men and women. 2) We also found that increased serum uric acid led to the damage of renal function in the subjects with normal eGFR value. 3) In addition, the serum uric acid was a risk factor to renal function in the subjects with relative high level of fasting glucose or who were smoking currently. Because of metabolic defects in people affected by diabetes, renal glucose reabsorption was increased, thus further sustaining hyperglycemia in patients.
Conclusions: Serum urate has causal effects on renal dysfunction in either female or individuals of under 65, or normal eGFR, or high level of fasting glucose, or current smokers.

AB1211-HPR THE USE OF SUBCUTANEOUS METHOTREXATE IN POLISH PATIENTS WITH RHEUMATOID ARTHRITIS

M. Przygodzka[1], K. Sikorska-Siudek[1], R. Radomski[2], S. Bojanowski[2]. *[1]Mazovian Centre of Rheumatology and Osteoporosis; [2]iEHR.eu, Warsaw, Poland*

Background: Methotrexate (Mtx) should be the drug of the first choice in rheumatoid arthritis (RA) if there are no contraindications to use it. The efficacy of Mtx is measured by remission or low disease activity and depends on the dose taken. Higher doses (25–30 mg/week) are more effective, but intolerance is the main cause of discontinuation of oral treatment. Subcutaneous Mtx is efficient alternative in those cases.
Objectives: The aim of this study was to evaluate subcutaneous Mtx use frequency in Polish patients and change oral form for subcutaneous as well.
Methods: The disease activity was assessed by Disease Activity Score 28 (DAS 28) during the first visit (V1) and after 3 months therapy (V2) and compliance with therapy as well.
Results: There were 194 RA patients diagnosed by the ACR and 1997 and/or ACR/EULAR 2010 criteria. 144 patients were treated by oral Mtx (group A) and 50 patients (group B) by subcutaneous Mtx at the time of study enrolment (V1).37 patients of group A (26%) required changes in therapy during V2, 24 (17%) were switched to subcutaneous Mtx (group A1). 6 patients of group B (12%) required change of treatment during V2, including 2 patients (4%) with subcutaneous Mtx, who were switched to oral Mtx.The main cause of changing therapy from oral to subcutaneous was gastrointestinal intolerance of high dose of Mtx. 69 patients (12%) of group A required additional steroid therapy compared to 18 (36%) of group B. Average DAS 28 decreased by 0.58 in group A1 in oral treatment and during the subcutaneous treatment time decreased by next 0.23. In group A1 during oral treatment 14 (58%) patients used 25 mg/week and 20 patients (83%) used 25 mg/week during subcutaneous treatment time.
Conclusions: Patients treatment by oral Mtx often require modification of therapy in comparison to patients treated by subcutaneous Mtx, including more frequent use of steroids
The main cause of oral intolerance are ailments of the digestive system.
Change of oral to subcutaneous therapy allows administration of higher doses of Mtx and results in decrease of DAS28 in comparison to the patients continuing their oral treatment.

AB1212-HPR DYNAMICS OF ARTICULAR SYNDROME IN RHEUMATOID ARTHRITIS AGAINST CORRECTION OF PROGESTERONE INSUFFICIENCY

M. Salokhiddinov, A. Ahmedov. *Rheumatology and Osteopathy, Tashkent Medical Academy, Tashkent, Uzbekistan*

Background: According to the literature, sex hormones manifest themselves as immune modulators that inhibit the ones and stimulate other immune functions. Studies have shown that patients with RA, decrease of estradiol and particularly

progesterone in the blood serum is found in the women of reproductive age. According to the literature, progesterone has a close relationship with T-cell immunity. A value of T-cell deficiency plays an important role in the cause of the autoimmune process

Objectives: To study of progesterone correction in RA patients.The aim of this study was to evaluate the effectiveness of progesterone deficiency correction in patients with rheumatoid arthritis based on the analysis of articular syndrome

Methods: The study involved 40 patients with a documented diagnosis of RA, women of reproductive age. The study group consisted of 30 patients who had correction of progesterone deficiency background in the pathogenetic therapy. The control group consisted of 10 female patients who are on the pathogenetic therapy. We used the following criteria: disease activity and severity of the articular syndrome with determining of the number of tender and swollen joints, indices of DAS and HAQ. Statistical analysis of the results of research used the method of parametrics of Student criterion

Results: Among the patients studied disease duration ranged from 3 months to 19 years (mean age 10±7,2 years), 20 patients (50%), from 5 to 10 years – 15 (37.5%), and more than 10 years – 5 patients (12.5%). X-ray picture of joint damage in the majority of patients corresponded to stage 2–3 – 87.5% (35 patients). Less common muscular disorders (7.5%), mainly in patients taking long-term GC, myalgia and muscle malnutrition were detected in 7.5% and 25% of patients, respectively. In addition to the articular syndrome, the most frequent complaints of general weakness (75%), irritability, sleep disorders and attention (50%), anxiety and anxiety (75%), low-grade temperature (10%)

Conclusions: Progesterone deficiency correction in RA patients against pathogenic therapy has improved performance of articular syndrome and improves quality of life, such as vitality, general health and social function as well as it contributes to the positive dynamics of mental health

AB1213-HPR A NATIONAL RHEUMATOID ARTHRITIS REGISTRY SUPPORTED BY A PUBLIC POLICY AS A STRATEGY FOR DISEASE CONTROL AND RISK MANAGEMENT IN COLOMBIA

O. Valencia[1], P. Sánchez[1], L. Acuña[1], L. Soler[1], C.E. Toro[2]. *[1]Cuenta de Alto Costo; [2]Asociación Colombiana de Reumatología, Bogotá, Colombia*

Background: Rheumatoid arthritis (RA) is a chronic disease that implies high direct and indirect costs for the health system (1,2). According to the needs of the health care system, the clinical interests and the national regulatory framework, it was developed a national registry information of RA patients (3).

Objectives: To show how a registry of information that would meet the RA situation was developed and to present the results obtained from the analysis of the Registry on this first year.

Methods: A national RA Registry was created after a comprehensive literature review to identify the relevant variables to determine monitoring indicators used by health insurers and health services providers in the attention of patients with RA. Variables were selected and defined by an agreement with clinical experts, thematic and methodological experts and were evaluated by the Ministry of Health in order to review and approve the structure to gather the information.

Results: A structure of 89 variables contained was defined. All entities must report annually to the Registry all the patients with a diagnosis of RA, their clinical and demographic characteristics, and the process of care and costs (3). On its first year the Registry provided a baseline of the disease situation of 68.357 patients with RA. Prevalence, incidence, state of disease and drugs including synthetic and biologic DMARDs were analyzed (Table 1). Most important results were: mean age 57 years; relation women: men 5.2:1; age at onset of disease: 36 years, mean evolution time of disease: 7 years; population with DAS 28 measured 45.6%; mean DAS-28 2.8; percentage of the patient with DMARD therapy 78.9% and bDMARD 16.5%.

Table 1. Characteristics of the population

Variable	Obs	Mean/prop.	Std. Dev.	Min	Max
Age	68376	57.0	13.3	22	104
Age at onset of disease	13607	36.4	7.7	20	51
Evolution time of RA	37963	7.5	8.1	0	51
DAS28	30956	2.82	1.37	0	1
*Women	57461	84.04			
*Men	10914	15.96			
*bDMARD	11276	16.50			
*DMARD	53374	78.01			

Conclusions: A national Registry supported by an official policy, with data from the real world provided for healthcare insurers gives an opportunity to obtain a global vision and to identify failures and strengths in the attention process of RA, and to develop indicators to obtain better outcomes. In the future, through continuous efforts towards improving the quality of care provided, these will allow to monitoring and decreasing the burden of RA in the country and may serve as a model to other countries.

AB1214-HPR SPINAL BRUCELLOSIS: A RETROSPECTIVE STUDY OF 30 CASES

S. Rekik, S. Boussaid, I. Abdelkafi, S. Hela, I. Cheour, M. Elleuch.
Rheumatology, la Rabta, Tunis, Tunisia

Background: Brucellosis is a major health problem in Mediterranean countries including Tunisia. The clinical presentation of this zoonosis varies considerable but osteoarticular involvement and spinal brucellosis particulary is the commonest complication.

Methods: This study was carried out between 2000 and 2015. One hundred and six patients with infectious spondylodicitis hospitalized in the department of rheumatology were analyzed. All patients were thoroughly interrogated subjected to a rigorous clinical examination and a battery of investigations including: complete blood count, urine analysis, blood culture, erythrocyte sedimentation rate, C - reactive protein (CRP) and serology for brucellosis. The imaging of spine ordered including: X-ray, bone scan and magnetic resonance imaging (MRI) with contrast enhancement.

Results: Thirty of the 106 patients (28%) proved to have spinal brucellosis. The mean age of these patients was 53 years (range 15–68 years) and female/men ratio at 1.5. The mean delay of diagnosis was 8 months. The following symptoms were observed: fever in 14 patients and back pain in all of patients. Other symptoms were less frequently observed, such as splenomegaly (2 patients), peripheral adenopathy (5 patients) and diarrhea (2 patients). Laboratory exams showed elevated erythrocyte sedimentation rate in 13 patients, high levels of CRP in all patients and leukocytosis in 11 cases. Wright serology was positive in 21 of the patients. Brucella melitensis was isolated in blood cultures in 2 cases. Standard X-rays were performed in all patients. They showed signs of spondylodiscitis in the lumbar spine in 20 cases, cervical in 2 cases and dorsal in 8 cases. Ct-scan and MRI confirms the diagnosis and showed associated epiduritis in 2 cases or abscess in 6 cases. Bone biopsy with histopathological examination was performed in 7 cases. A combination of cycline and rifampicin was given to all patients. The duration of therapy was between 6 and 8 weeks.

Conclusions: Brucellosis is present with various clinical signs in endemic areas and may simulate many diseases. The need for prompt diagnosis and treatment of spinal brucellosis is of utmost importance to prevent serious bone destruction and severe neurologic Sequelae.

HPR interventions (educational, physical, social and psychological)

AB1215-HPR EFFECTS OF BEETROOT JUICE SUPPLEMENTATION N ENDOTHELIAL FUNCTION AND MARKERS OF INFLAMMATION AMONG PATIENTS WITH RHEUMATOID ARTHRITIS

A. Stavropoulos[1], E. Manthou[2], T. Nakopoulou[3], K. Georgakouli[2], A. Jamurtas[2]. *[1]Carnegie School of Sport, Leeds Beckett University, Leeds, United Kingdom; [2]School of Physical Education and Sports Science, University of Thessaly; [3]Radiology, General Hospital of Trikala, Trikala, Greece*

Background: Nitric oxide (NO) is central in the process of vasodilatation (1). Limited bioavailability of NO often associates with endothelial dysfunction, a precursor to atherogenesis (1). Such dysfunction is often observed in patients with chronic conditions such as Rheumatoid Arthritis (RA) (2) and Chronic Obstructive Pulmonary Disease (COPD) (3). Common therapies for this include the administration of nitrate-rich medication. However, in the general population beetroot juice supplementation has been shown to increase NO bioavailability (4). It could therefore have beneficial effects on endothelial function of these patients as well.

Objectives: To evaluate the effects of short-term beetroot juice supplementation on endothelial function in patients with RA and COPD.
Methods: A total of 28 patients, 9 with RA, 9 with COPD and 10 healthy controls participated in the study. Following consent, they were asked to report at the testing venue (Ultrasonography Laboratory, General Hospital of Trikala) early in the morning, following an overnight fast. Demographic and disease characteristics were recorded; height, weight, classical risk factor for cardiovascular disease and body composition were assessed. Endothelial function was assessed using flow mediated vasodilatation. They randomly received either beetroot (experimental leg) or blackcurrant juice (control leg), which they consumed daily for two weeks. Thereafter they were re-evaluated. Following a two-week washout period, they crossed over to the other leg of the study.
Results: There was no difference in pre-occlusion diameter between any of the time-points. Endothelial function was significantly improved following beetroot juice consumption for both patient groups (RA: 2.6% [0.9 – 6.2] vs 10.7% [6.2 – 11.7]; p=0.013. COPD: 3.4% [1.2 – 4.8] vs 7.8% [3.6 – 10.2]; p=0.034) while it remained relatively unaffected by blackcurrant consumption (Overall: 3.9% [0 – 5.1] vs 4.2% [2.3 – 6.1]; p=0.26).

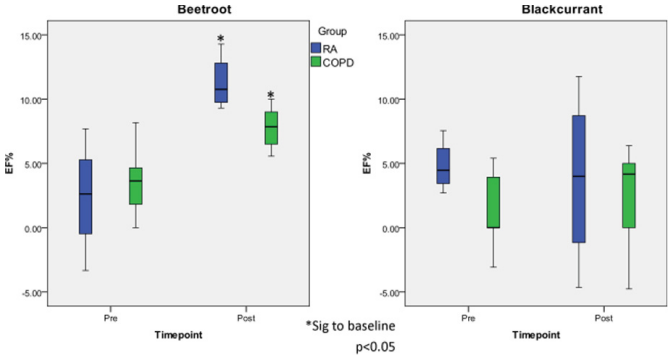

Figure 1

Conclusions: A two week consumption of beetroot juice seems to be able to improve endothelial function among patients with RA and COPD. This could elicit significant health benefits. Further research to investigate the benefits of longer-term use on endothelial function and related cardiovascular health, as well as disease symptoms, and quality of life is advocated.

AB1216-HPR THE EFFECTS OF APPLICATION OF IONTOPHORESIS AND PHONOPHORESIS IN PATIENTS WITH SUBACROMIAL IMPINGEMENT SYNDROME

A. Yildiz[1], E. Kusan[2]. *[1]Physiotherapy and Rehabilitation, Marmara University Health Sciences Faculty; [2]Physiotherapy and Rehabilitation, Kosuyolu Medipol Hospital, Istanbul, Turkey*

Background: Subacromial impingement syndrome (SIS) is defined as the mechanical compression of subacromial structures between the coraco-acromial arch and the humerus during active elevation of the arm above shoulder height.
Objectives: The aim of the study was to investigate the effects of applications of iontophoresis and phonophoresis, which has been used in addition to physiotherapy program on pain and disability level in patients with SIS.
Methods: The study was conducted with subjects (n=43) diagnosed with SIS. The subjects were divided into two groups randomly as iontophoresis group (IG) and phonophoresis group (PG). Diclofenac sodium iontophoresis was applied to the first group (n=22), diclofenac sodium phonophoresis was applied to the second group (n=21). In addition all of groups therapy program includes superficial heat, transcutaneous electrical nerve stimulation and exercise. The groups were evaluated before and after treatment in terms of pain and scores of shoulder disability. Visual analog scale was used to assess of pain (night pain, rest pain, pain with motion and pain in functional use), Shoulder Disability Questionnaire (SDQ) and Disabilities of the Arm Shoulder and Hand (DASH) were used to assess of shoulder disability.
Results: 43 patients with IS aged 18 to 65 years were recruited to the study. Demographic data were similar in the groups.
After treatments pain severity (night pain and pain in functional use) was significantly decreased in both groups (p<0,05) and in the scores of disability of shoulder (p<0,05) in both groups. Pain relief was similar in groups. SDQ and DASH scores were improved in two groups after treatments. But there was no difference between the groups in terms of functionality and disability scores.

Table 1. The level of pain, functionality and disability scores in groups

	IG		p	PG		p
	Before mean ± sd	After mean ± sd		Before mean ± sd	After mean ± sd	
Night pain severity	5,59±3,01	1,77±1,99	*	4,47±2,42	1,42±1,8	*
Severity of general pain	5,09±2,13	2,63±1,59	*	4,52±1,72	2,28±1,45	*
SDQ	48,00±20,75	22,36±20,41	*	50,12±21,18	19,35±15,84	*
DASH	38,90±14,74	19,63±9,37	*	41,57±9,53	22,64±10,37	*

IG: Iontophoresis group, PG: Phonophoresis group. *p<0,001.

Conclusions: This study shows that diclofenac sodium iontophoresis and phonophorosis that are used in patients with subacromial impingement syndrome have similar positive therapeutic effects on shoulder functions.

AB1217-HPR THE EFFCET OF ADDING WII FIT® GAMES TO TRADITIONAL REHABILITATION ON PAIN, QUALITY OF LIFE AND FUNCTIONALITY AFTER ACL RECONSTRUCTION

Z.B. Karakoç, T. Kuru Çolak, B. Kapşigay, Z. Sarı, M.G. Polat. *Physical Therapy and Rehabilitation, Marmara University Health Science Institute, Istanbul, Turkey*

Background: Wii Fit® games are widely used in the rehabilitation field due to their audiovisual feedback and motivating effect (1). Although it is well known that Wii Fit® games improve the quality of life in various groups (2, 3), there is no study on those who have undergone anterior cruciate ligament (ACL) arthroscopic surgery.
Objectives: The aim of this study was to determine the effect of Wii Fit® games on pain, quality of life and lower extremity functionality after ACL reconstruction.
Methods: Patients who underwent arthroscopic ACL reconstruction surgery in Kartal Dr. Lutfi Kırdar Training and Research Hospital were included in this study. Being volunteer for this study, not receiving any other treatment after surgery and being in the first 6 months after surgery were determined as inclusion criteria. Having any orthopaedic injury or congenital deformitiy and having vision, balance or neurologic problems were defined as exclusion criteria. After recording demographic data patients' pain, quality of life and lower extremity functionality were evaluated with "Visual Analog Scale (VAS)", Anterior Cruciate Ligament Quality of Life (ACL-QoL) Scale and "Lower Extremity Functionality Scale (LEFS)", respectively.
Patients received accelerated rehabilitation program 3 days per week, for 6 weeks. Wii Fit® games has added to accelerated program for 40 minutes in every treatment sessions in the last three weeks. Assessments were performed at the baseline 3th week and, end of the treatment. The SPSS v11.5 was used for data analysis.
Results: Twelve males with a mean age of 29±8,51 years were included in this study. Their average body mass index, time between injury and surgery and time between surgery and the beginning of rehabilitation were 25,82±2,85 kg/m^2, 374 days and 30±42,62 days, each seperately. Pain improved significantly during the treatment (p=0.012). The quality of life level increased significantly at the end of the study compared to the 3th assessment (p=0.041). Lower extremity functionality improved during the rehabilitation (p=0.003).
Conclusions: Patients participating in this study expressed Wii Fit® games as funny and easy method to utilize. Wii Fit® games are suitable for use in patients who have had ACL arthroscopic surgery.

AB1218-HPR EFFECTIVENESS OF PLATELET-RICH PLASMA ON FUNCTION AND PERFORMANCE IN PATIENTS WITH KNEE OSTEOARTHRITIS: PRELIMINARY RESULTS

D.C. Sarac[1], B. Unver[2], S. Cekmece[2], M. Erduran[3]. *[1]Division of Physiotherapy and Rehabilitation, Faculty of Health Sciences, Izmir Katip Celebi University; [2]School of Physiotherapy and Rehabilitation; [3]School of Medicine, Department of Orthopaedics, Dokuz Eylul University, Izmir, Turkey*

Background: Osteoarthritis is one of the most painful conditions and the most frequent cause of functional limitation and disability. There are variety of methods used in osteoarthritis (OA) treatment, including, physical therapy, exercise, intraarticular injections, surgery, etc. Platelet-rich Plasma (PRP) is a relatively new autologous biologic treatment that is used for stimulating cartilage healing process and improving the symptoms. Although the effects of PRP injection on pain and function investigated before, as to our knowledge there are no studies related to performance.
Objectives: Aim of this study was to investigate effectiveness of PRP on improving function and performance in patients with knee osteoarthritis.
Methods: This study included 28 patients (16 F, 12 M) who were affected by grade 1–3 bilateral knee OA according to Kellgren-Lawrence Scale. Patients received three injections of PRP that were performed at monthly intervals by the same doctor. All patients were evaluated before and six months after the first injection. Primary outcome measures were: Stair Climbing Test (SCT), 50-Foot Walk Test (50 FWT), 30-sec Chair Stand Test (30 CST) and Timed Up and Go Test (TUG), IOWA Score. Additionally, Hospital for Special Surgery Score (HSS) was also recorded as a secondary outcome measure. Wilcoxon signed-rank test is used for interpreting the differences between before and after the injections.
Results: All patients completed the study with no adverse effects. The mean age of the patients were 59±7.66 years. Improvements were determined for all outcome measures after 6 months regard to baseline results ($p<0.01$) (Table 1).

Table 1. Comparision of Primary and Secondary Outcomes at Baseline and After 6 months

	Before Median (IQR 25/75)	6 Months After Median (IQR 25/75)	P*
Stair Climbing Test	16 (10.55/19.75)	13.1 (9.25/16.75)	0.001
50-Foot Walk Test	29.5 (27.0/32.45)	27.26 (25.1/30.32)	0.001
30-sec Chair Stand Test	10.5 (9.25/14.0)	12.5 (10.1/15.75)	0.001
Timed Up and Go Test	9.25 (7.25/14.5)	8.1 (6.58/10.15)	0.001
IOWA Score	10.2 (8.92/12.87	9,9 (8.12/10.75)	0.008
HSS Right	63.5 (55.0/75.0)	75 (66.0/66.75)	0.001
HSS Left	66.5 (55.25/79.25)	78.5 (70.0/85.0)	0.001

Wilcoxon signed-rank test. IQR: Interquartile Range, HSS Right: Hospital for Special Surgery Score of right knee, HSS Left: Hospital for Special Surgery Score of left knee. *$p<0.05$.

Conclusions: Our preliminary findings show that PRP is safe and effective autologous biologic agent that might improve function and performance in patients with mild to moderate knee OA and; could be considered as a treatment option in patients with knee OA.
Disclosure of Interest: None declared
DOI: 10.1136/annrheumdis-2017-eular.5952

AB1219-HPR EXPERIENCES OF SWEDISH "PAIN SCHOOL - COMPETENCE FOR LIFE" OF PATIENTS WITH CHRONIC WIDESPREAD PAIN - A QUALITATIVE INTERVIEW STUDY

C. Goksör[1,2], A. Bergenheim[1,3], K. Mannerkorpi[1]. *[1]Neuroscience and Physiology, Gothenburg University, Sahlgrenska Academy; [2]Närhälsan Frölunda Rehab, Gothenburg; [3]Närhälsan Uddevalla Rehab, Uddevalla, Sweden*

Background: Chronic pain is generally associated with low activity level, low work capability, and negative health consequences (1). Education and exercise have shown effective results for patients with chronic pain (2), and is according to EULAR 2016 recommendations first line interventions for patients with fibromyalgia (3). This educational program "Pain school - Competence for life" for patients with chronic pain was developed by the Swedish Rheumatoid Association together with health care professionals for use in primary health care, but is not previously evaluated. The pedagogy is based on a biopsychosocial perspective and self-efficacy with the purpose to provide knowledge, experience and skills within pain, balance of daily living and physical activity. The program comprises four educational group sessions and 10 weeks of physical activity.
Objectives: To gather deeper knowledge about how patients with chronic widespread pain experienced participation in the Pain school –Competence for life", with focus on changes in perception of pain and/or lifestyle.
Methods: 12 women (age 25–72 years) with chronic widespread pain were included in this qualitative interview study set in primary health care. Informed consent were signed by all participants. Semi-structured individual interviews were held 10 weeks after completion of four educational group sessions. Interviews were conducted by two authors and transcribed verbatim.
Results: One theme and four categories were identified. An overarching theme, describing the participants' experiences of the educational program, was *a meaningful learning process*. It covered four categories: *increased understanding of body and mind, new strategies and ways of thinking, experienced value of participation*, and *preconditions for change*. Participants described increased knowledge, awareness and acceptance relating to their symptoms and limitations. They expressed new strategies relating to managing pain, physical activity, and everyday life. Both individual and social value of participation was described, such as increased well-being, decreased anxiety and improved relationships. Group dynamics, structure of education and former knowledge was described to predispose change in perception of pain and lifestyle.
Conclusions: The results provide deeper knowledge about patients' experiences of the educational program Pain School Competence for life. The educational program appears to provide a meaningful and well-functioning structure for education for patients with chronic widespread pain in primary health care. Further, this can contribute to improve education and rehabilitation for patients with CWP provided by physiotherapists and occupational therapists in primary health care.

AB1220-HPR THE LEVEL OF ADHERENCE OF RHEUMATOLOGY PATIENTS IN SLOVENIA

D. Stanković, M. Pavic Nikolic, A. Hočevar. *Department of Rhematology, University Medical Centre Ljubljana, Ljubljana, Slovenia*

Background: Patient adherence is one of the central factors associated with the control of patient's symptoms, good functional ability and longevity. Health care professionals have significant role in their daily practice to improve the adherence to medications.
Objectives: We aimed to assess the adherence of patients treated at our secondary/tertiary rheumatology center.
Methods: Data were collected in a prospective manner. We investigated the level of self-reported adherence to treatment in 115 consecutive patients (81 women; mean age (SD) of 56.5±14.7 years) with systemic inflammatory diseases in December 2016. We used the 19-item questionnaire-Compliance-Rheumatology (CQR).
Results: We found optimal adherence in 52% of patients: the average (SD) adherence rate was 71.1±9.42. We didn't find any significant differences between adherent and nonadherent patients regarding patient age, gender, the diagnosis of rheumatic disease and disease duration time, however, patients with higher education level (at least graduate level) were more compliant than those without any formal education (p=0.006). In addition there was no association between adherence and the type of medication (csDMARD, bDMARD) (p=0.39). Patient data are presented in the table 1.

Table 1. The adherence according to the patient diagnosis

Diagnosis, n (%)		Disease duration, year	CQR total score, mean (SD)	CQR quartiles, n (%)			
				Least adherent n (%)		Most adherent n (%)	
				<64	64–71,9	71,9–87,9	87,9+
RA	65 (56%)	10,8	69,90 (9,56)	18 (28%)	19 (29%)	28 (43%)	0
PSA	14 (12%)	14,7	74,18 (10,62)	3 (22%)	1 (7%)	10 (71%)	0
AS	14 (12%)	9,7	73,43 (10,73)	2 (14%)	3 (22%)	9 (64%)	0
Other	22 (20%)	12	70,8 1 (11,59)	6 (27%)	3 (13%)	12 (55%)	1 (5%)

Conclusions: Our study showed lower adherence rate than expected. To improve patient adherence we should work more in the future on providing additional knowledge and support to patients.
Acknowledgements: Special thanks to our colleagues Tadeja Šušteršič and Albina Stanovnik.

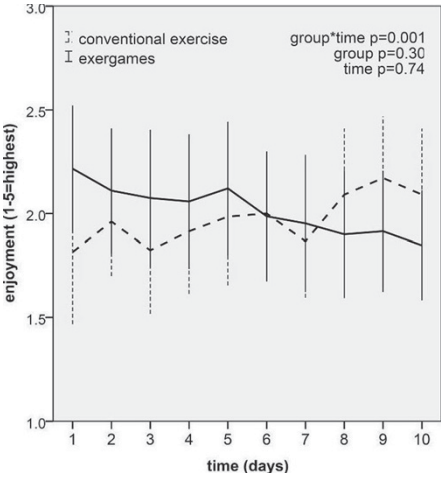
AB1221-HPR COMPARISON OF DMARD THERAPIES ON NSAID INTAKE, DISEASE ACTIVITY, FEAR OF MOVEMENT, AND QUALITY OF LIFE IN PATIENTS WITH ANKYLOSING SPONDYLITIS

G.I. Kinikli[1], S. Karahan[2], A. Ates[3], M. Turgay[3], G. Kinikli[3]. *[1]Dept. of Physiotherapy and Rehabilitation, Hacettepe University Faculty of Health Sciences; [2]Dept. of Biostatistics, Hacettepe University Faculty of Medicine; [3]Dept, of Rheumatology, Ankara University Faculty of Medicine, Ankara, Turkey*



Background: Ankylosing Spondylitis (AS) may result in loss of mobility and function; therefore, patients can experience pain and stiffness with a loss of physical function in addition to severe impairment in their quality of life. Standard treatment of AS consists of nonsteroidal anti-inflammatory drugs (NSAIDs) and physical therapy.

Objectives: The aim of this study was to compare the effectiveness of DMARD therapies on requirements for NSAIDs, disease activity, fear of movement, and quality of life in AS patients.
Methods: A total of 74 patients diagnosed according to the modified New York criteria for AS were enrolled. To calculate NSAID intake, the type of NSAID, dose, and percentage of days with intake were recorded in conjunction with DMARD therapy, age, body mass index (BMI), and disease duration. Patients were assessed to measure several parameters: 1) disease activity using the Bath Ankylosing Spondylitis Disease Activity Index (BASDAI; 2), fear of movement as assessed by the Tampa Scale for Kinesiophobia (TSK); and 3) quality of life using the Ankylosing Spondylitis Quality of Life Scale (ASQoL) status from the patient's perspective.
Results: Seventy-four patients (36 women, 38 men; mean age: 43.81±10.18 years; mean disease duration: 9.89±8.50 years; BMI: 28.20±5.07) treated with four different DMARDs (Adalimumab+Golimumab [ADA+GO]=17; Infliximab [INFX]=19; Etanercept [ETA]=13; Sulphasalazine [ST]=25) were included. NSAID intake was significantly lower in the INFX therapy group (mean: 28.1±81.5) compared to the ADA+GO (mean: 33.3±76.0), ETA (mean: 33.5±58.2), and ST therapy groups (mean: 68.1±76.1) (p=0.003). BASDAI scores (mean: 3.9±2.4), NSAID intake (mean: 68.1±76.1; p=0.003), and AS-QoL scores (mean:10.2±7.4) were significantly higher in the ST group compared to the other drug groups. TSK scores were also similar between different NSAID intake groups (p=0.089).
Conclusions: According to our results, ST was not effective enough even with concomitant therapy consisting of a single oral dose of NSAID or standard doses of oral corticosteroids in terms of disease activity, fear of movement, and quality of life in AS patients.

AB1222-HPR EXERGAMES VERSUS SELF-REGULATED EXERCISES WITH INSTRUCTION LEAFLETS TO IMPROVE ADHERENCE IN GERIATRIC REHABILITATION: A RANDOMIZED CONTROLLED TRIAL

J. Kool[1], P. Oesch[1], L. Fernandez-Luque[2], E. Brox[3], G. Evertsen[3], A. Civit[4], R. Hilfiker[5], S. Bachmann[6,7]. *[1]Department of Physical Therapy, Kliniken Valens, Valens, Switzerland; [2]Qatar Computing Research Institute, Hamad Bin Khalifa University, Qatar Foundation, Doha, Qatar; [3]Norut, Tromsø, Norway; [4]Architecture and Computer Technology Department, University of Seville, Seville, Spain; [5]University of Applied Science HES-SO, Sion; [6]Department of Geriatrics, Inselspital, Bern University Hospital, University of Bern, Bern; [7]Department of Rheumatology, Kliniken Valens, Valens, Switzerland*

Background: Improving mobility in elderly persons is a primary goal in geriatric rehabilitation (Bachmann 2010). Self-regulated exercises with instruction leaflets are used to increase training volume but adherence is often low. Exergames may improve adherence. This study therefore compared exergames with self-regulated exercise using instruction leaflets.
Objectives: To evaluate short-term effects of exergames versus self-regulated exercise using instruction leaflets. Primary outcome was adherence. Secondary outcomes were enjoyment, motivation and balance.
Methods: Design: single center parallel group non-blinded randomized controlled trial with central stratified randomization (Hasselmann 2015). Setting: center for geriatric inpatient rehabilitation. Included were patients over 65 with mobility restrictions who were able to perform self-regulated exercise. Patients were assigned to self-regulated exercise using a) exergames on Windows Kinect® (exergame group EG) or b) instruction leaflets (conventional group CG). Physical therapists instructed self-regulated exercise to be conducted twice daily during thirty minutes during ten working days. Patients reported adherence (primary outcome), enjoyment and motivation daily. Balance during walking was measured blind with an accelerometer. Analysis was by intention to treat. Repeated measures mixed models and Cohen's d effect sizes (ES, moderate if >0.5, large if >0.8) were used to evaluate between-group effects over time.
Results: We evaluated 217 patients and included and 54, 26 in the EG and 28 in the CG. Adverse effects were observed in two patients in the EG who stopped because of pain during exercising. Adherence was comparable at day one (38 min. in the EG and 42 min. in the CG) and significantly higher in the CG at day 10 (54 min. in the CG while decreasing to 28 min. in the EG, p=0.007, ES 0.94, 0.39–0.151). Benefits favoring the CG were also observed for enjoyment (p=0.001, ES 0.88, 0.32 – 1.44) and motivation (p=0.046, ES 0.59, 0.05 -1.14)). There was no between-group effect in balance during walking.

Conclusions: Self-regulated exercise using instruction leaflets is superior to exergames regarding adherence, enjoyment and motivation in a geriatric inpatient rehabilitation setting. Effects were moderate to large. There was no between group difference in balance during walking.

AB1223-HPR BELIEFS AND ATTITUDES OF ITALIAN NURSES TOWARDS PLACEBO AND NOCEBO RESPONSES INDUCED BY CONTEXTUAL FACTORS IN CLINICAL PRACTICE

M. Testa[1], G. Rossettini[1], T. Geri[1], A. Viceconti[1], L. Colloca[2,3], A. Palese[4]. *[1]Department of Neuroscience, Rehabilitation, Ophthalmology, Genetics, Maternal and Child Health, University of Genova, Savona, Italy; [2]Department of Pain Translational Symptom Science, School of Nursing; [3]Department of Anesthesiology, School of Medicine, University of Maryland, Baltimore, United States; [4]Department of Medical and Biological Sciences, University of Udine, Udine, Italy*

Background: Placebo and nocebo represent psycho-neuro-immuno-endocrinological responses commonly encountered in nursing care (1,2). A new paradigm proposed the contextual factors (CF) as mediators and moderators of these responses (3). To date, the knowledge about the awareness of CF and their use in nursing is scant.
Objectives: The goal of this study was to examine frequency of use, beliefs and attitudes of Italian specialised nurses regarding the contextual factors.
Methods: In December 2016, through SurveyMonkey Software®, an online survey was conducted by sending a questionnaire to the members of four Italian Nursing Association, grouping nurses specialized in Neuroscience, Medical, Geriatric and Diabetic care. Behaviours, beliefs and attitudes of nurses about the implementation of CF in clinical practice were assessed by a 17 items questionnaire and resulting data were analysed by descriptive statistic.
Results: Of the 1411 members of the involved Nursing Associations invited to participate to the survey 425 responded (30.1%). An high number of respondent nurses adopts CF often in their practice (42%). They believe that CF can positively influence acute pain (47.5%), chronic pain (61%) and rheumatologic disorders (42%). 34% of responders consider the use of CF, if it can determine beneficial psychological effects, as ethically acceptable. 15.5% responders oppose to the adoption of CF when based on deception or if they undermines trust between nurses and patients. A relevant number of nurses (24%) do not communicate the use of CF to their patients and 19% implement CF as addition to other nursing interventions to optimize clinical responses. Nurses explain the power of CF through patient's expectation and psychological mechanism (11%).

Conclusions: The Italian specialised nurses use CF quite frequently and believe that their use has the capacity of positively influencing the clinical outcome. Larger surveys are needed to understand the proportion of use of CF by nurses in common clinical practice in Italy.

AB1224-HPR COULD WE USE THE LAY REFERRAL SYSTEM TO IMPROVE THE EARLY ARTHRITIS CLINIC EFFICIENCY?

M. Dobroiu[1], M. Trandafir[1], C. Ioan[1], D. Vasile[1], D. Predeteanu[2], R. Ionescu[2], F. Berghea[2] on behalf of RCRD. *[1]Rheumatology, Sf. Maria Hospital; [2]Rheumatology, Carol Davila University of Medicine and Pharmacy, Bucharest, Romania*

Background: The professional's monopoly on knowledge about disease and its treatment is something gone now, in the era of internet and patient consumerism. In addition, the interest of rheumatologists (and the interest of the society, too) shifted toward early recognition of the disease and early arthritis clinics. Education is definitely one of the solutions to increase the awareness of potential patients regarding rheumatic diseases. However most of rheumatic diseases are not very frequent in the population that raise the problem of cost efficacy of the education process. Per Eliot Freidson's view, the members of every community of whatever kind share some cultural understandings about disease, treatment, and cure. The lay community network could be considered an instrument for dissemination of proper knowledge regarding health and could help to earlier recognition of a sign of disease related to early arthritis.
Objectives: To identify the opportunity of using lay network for early arthritis referral. In addition, we intended to identify the most suitable vectors from this network to be used for education and dissemination of medical knowledge.
Methods: 48 rheumatic patients (mean age (SD): 50.8 (14,7)) consecutively admitted in one tertiary clinic have been invited to answer to a structured questionnaire. Sex ratio (M: F) was 1:2, average disease duration 7.7 (8.3) years.
Results: In 28.3% cases the first sign of disease was noticed not by the patient but by somebody else, for 36.7% a delay of several months to one year was declared between first sign of disease and professional examination, 71.7% use to discuss bout health problems with their lay network (often and very often), 76.1% consider them able to give pertinent advices regarding the disease they suffer from, 45,7% are ready to act as an education vector and 41,3% are ready to participate in additional education programs. They interest in such activity is not related to gender, education level or work status.
Conclusions: Lay network referral could be a powerful instrument to reduce the duration between onset of rheumatic symptoms and medical visit, to increase the awareness regarding rheumatic disease, to reduce the cost of health education. Health professionals should understand how to use these networks.

AB1225-HPR A PROGRAM BASED ON PSYCHOEDUCATION FOR RHEUMATOID ARTHRITIS PATIENTS

P. Osorio[1], L. Villarreal[2], P. Santos-Moreno[3], D. Buitrago-Garcia[4], G. Cajiao[5], A.M. Orozco[5]. *[1]Psychology; [2]Psychology and processes; [3]Rheumatology; [4]Epidemiology, Biomab, Center for Rheumatoid Arthritis, Bogota; [5]Psychology, El Bosque University, Bogota, Colombia*

Background: The National Institute of Arthritis and Musculoskeletal and Skin Diseases defines rheumatoid arthritis (RA) as a chronic disease that affects the joints, causing pain, swelling, stiffness, reduced mobility and affection of internal organs. In order for patients to be able to learn to accept and integrate the disease as a part of theirs daily life, it is important that they have enough information and knowledge about their health condition. The strategy of psychoeducation is important because it involves the patient actively and seeks to have specialist who provide relevant, clear, and comprehensive information. In this way, a change is generated at level of beliefs and myths on the disease, and suggests suggestions for coping with situations for the management of the disease's impact on the patient's life.
Objectives: To determine the effect of a psychoeducation program on the quality of life and commitment to the treatment of patients diagnosed with RA from an specialized center in Bogotá.
Methods: We conducted a quasi-experimental study with two independent groups, one experimental and one for control. The Inclusion Criteria was: patients with RA over 30 years old that knew how to write and read with mobility resources. We excluded patients with emotional stress, stroke, and diagnosed cognitive deficit or with patients with consumption of psychoactive substance. We applied the Analog Visual Scale (EVA), a Quality of Life Questionnaire - Specific for patients with Rheumatoid Arthritis (QOL-RA). Data Analysis: when performing the normality test, the QoL-RA results were parametric and the analysis was performed with Student's t test for independent measurements. On the other hand, the results of the EVA and CQR were non-parametric, for that reason we worked with the Mann Whitney U-test.
Results: We included 36 patients, men (4) and women (32), aged between 35 and 75 years, with diagnosis of RA, which belong to the integral model of RA specialized center. The subjects that patients preferred were: Disease management, changes in health condition, training in abilities for self-care among others. Statistical analysis showed that, when we evaluated quality of life T-student test did not showed any statistical differences between pre and post test results in both groups. The Man Wittney test showed statistical differences between groups (u=70,500, z=241,500, p=,004) regarding the compromise with the RA treatment, but it did not showed differences in regards of pain intensity between groups.
Conclusions: We recommend a strategy to facilitate the process of data collection in pre-test and post-test. For the next application of the program, it is suggested that the sample of patients must be increased, to increase the duration of each session and the number of sessions of the program. In order to achieve the patients' attendance at the program, maintain permanent communication (may be by telephone). To have printed or recorded material (Brochures, guides, CDs, etc.) is recommended with the most relevant to each session of the program.

AB1226-HPR VACCINATION COMPLIANCE IN AUTOIMMUNE INFLAMMATORY RHEUMATIC DISEASES (AIRDS): ROLE OF SPECIALIST NURSE

R.D. Thakran, S.S. Baghel, R. Rawat, C. Messi, S. Kapoor, S. Garg, A.N. Malaviya. *Rheumatology, Indian Spinal Injuries Centre, New Delhi, India*

Background: The patients with autoimmune inflammatory rheumatic diseases (AIRDs) have double the risk of infections as compared to the general population this may be due to highly inflammatory nature of the disease, the drug used, and the co-morbidities. In recent years, the efficacy of vaccinations has been proven in decreasing morbidities and mortality among these patients, hence, it reduces the cost of the treatment and improves the quality of life of the patients. However, low vaccination compliance is a global problem. Therefore, in this study, we tried to assess the effect of nursing counselling on vaccinations compliance.
Objectives: To assess the efficacy of counseling by the specialist rheumatology nurses in vaccination compliance among AIRDs patients.
Methods: - All the adult patients (>18yrs), suffering from AIRDs, were advised vaccinations between January to December 2016 were enrolled in this study. The basic demographic and disease-related data captured with details of vaccinations such as date of advice of vaccination and reasons for non-compliance were recorded. The patients were intensely counselled by specialist nurses about the importance and needs of vaccination, clarifying their doubts. Reinforcement of the same was carried out in the follow-up visits.
Results: A total of 506 patients (374 female, 73.9.2% and 132 male, 26%), with mean age 48 years, diagnoses; rheumatoid arthritis: 378 (74.75%), Spondyloarthropathy: 80 (15.81%) other autoimmune rheumatic disease 48 (9.48%). Co-morbidities status: 309 (61%) having multiple co-morbidities and 197 (38.9%) have no co-morbidities. The vaccination compliance outcome is shown in table.

Table 1

Vaccine	Patients	Compliant	Non-compliant	Same day	Within 3 months	Within 6–9 months
Pneumovac 23	506	456 (90.1%)	50 (9.9%)	306 (67.1%)	103 (22.5%)	43 (9.4%)
Prevnar 13	244	211 (86.4%)	33 (13.6%)	143 (58.6%)	61 (25.0%)	7 (3.3%)
Influvac	506	443 (87.5%)	63 (12.5%)			

Conclusions: The compliance rate of all vaccinations was highest on the same day when it was prescribed. This was despite the fact that the patients pay for their own vaccinations without any third party payment. However, the compliance decreases with increase in the period when it was prescribed with the passage of time. This suggests that intense counselling, availability of vaccines at premises (pharmacy) and administration of vaccination free of cost are a few of the contributory factors which can boost the compliance of the vaccination among patients with AIRDs

AB1227-HPR VALIDATION AND APPLICABILITY OF A NOVEL OSTEOMALACIA KNOWLEDGE BASED EDUCATIONAL INSTRUMENT (OKQ)

S. Robinson[1], R. Waxman[2], D. Walker[1], P. Helliwell[2], A. Adebajo[3]. *[1]Rheumatology, North Tynside General Hospital, North Shields; [2]Leeds Institute of Rheumatic and Musculoskeletal Medicine, University of Leeds, Leeds; [3]Faculty of Medicine, Dentistry and Health, University of Sheffield, Sheffield, United Kingdom*

Background: Osteomalacia is caused by a deficiency of vitamin D and can be corrected by changes in diet, lifestyle and supplementation. Consequently, it is a condition where education has a primary role in prevention.
Objectives: If educational interventions are to be developed and evaluated, then an instrument for measuring knowledge is required. This has led us to develop a novel Osteomalacia Knowledge Questionnaire (OKQ).
Methods: Based on nominal group technique, a steering group of people who are knowledgeable about osteomalacia, educational theory and questionnaire development was convened. The group decided to use true and false questions. Important areas of knowledge of osteomalacia were first determined by the group and then relevant statements which were true or false were written and grouped into 8 sections of 5 questions, each covering the different areas of knowledge. This resulted in a knowledge instrument with 40 questions in all. The questions were tested for utility and ambiguity in the group and modified and replaced accordingly.
The questionnaire was then trialled in 37 people of South Asian origin (an osteomalacia susceptible population), in three groups. Participants were initially administered the OKQ and then received an educational intervention comprising a practitioner led education session on osteomalacia, including a presentation and written or electronic material. Participants were re tested with the OKQ after 6 weeks.
Although there is no "gold standard" for measuring knowledge about osteomalacia, if effective, increased knowledge should lead to an increase in vitamin D (Vit D) levels and a decrease in parathormone (Pth) levels. Vitamin D and Parathormone levels were measured alongside the OKQ in 2 of the groups before and after the educational intervention
Results: Baseline knowledge about osteomalacia was low pre education averaging only 12.7 out of 40 (range 0–29) (n=37).
A total of 30 participants (81%) attended for the follow up test. They averaged a score of 13.9 at baseline and 23.4 at follow up. This was statistically significant (p=0.002 Mann Whitney) and demonstrated sensitivity to change of the OKQ.
Knowledge at baseline was correlated with vit D and Pth blood levels for two of the groups (n=27). This showed correlation coeficients of 0.128 and -0.407 respectively. For change of knowledge and change of parathormone (n=21) the r value was -0.324 suggesting a relationship between knowledge and Pth that is worthy of confirmation through further studies.
Conclusions: A novel questionnaire has been developed that has face validity for testing knowledge about osteomalacia. It has proved feasible and shown sensitivity to change. It has also shown promising correlation with biochemical measures of osteomalacia.

AB1228-HPR IN ABSENCE OF SPECIFIC ADVICE, WHAT DO THEY EAT AND AVOID? DOES IT MATTER? DIET EVALUATION OF INDIAN (ASIAN) PATIENTS OF RA IN A COMMUNITY RHEUMATOLOGY CLINIC

T. Kianifard, M. Saluja, A. Chopra. *Rheumatology, Center for Rheumatic Diseases, Pune, India*

Background: Diet in RA is generally considered to be inadequate/inappropriate. Rheumatologists often neglect this important patient concern. ACR/EULAR guidelines do not provide adequate advice. Ayurveda (ancient India medicine system) with highly restricted diet is popular with Indian patients.
Objectives: To evaluate diet adequacy in patients of RA in our setting
Methods: 139 consenting patients (ACR 1987 classified)on long term supervised care and 165 unmatched healthy subjects (mean age 37.7 years) were interviewed in no particular order as per protocol; cross sectional design. A 10 day diet recall period and a-priori validated questionnaires was used. National (India) recommended daily allowance (RDA) and diet analysis (web based and food composition tables) methods were used.Standard CRF captured clinical data [mean pain VAS 4.6 cms,mean HAQ score (Indian version) 6.5]. Standard statistical analysis (SPSS) was done; significant $p<0.05$.
Results: Table 1 (women) and 2 (men) show average daily energy expenditure and consumption of selected food items, RDA and p values (on comparison: P (1) for patient versus control, P (2) for patient versus RDA: p by Mann Whitney). Compared to RDA, patient consumption was significantly higher for most of the items except K; includes calcium, phosphorus, zinc, iron, folic acid, vitamin B group (data not shown in Tables). When compared to healthy subjects, consumption was significantly lower for female patients but not different for men (except for K). Reduction in diet K in RA group was more pronounced for women. All patients tested normokalemic (mean serum K+ 4.37 mEq/l). No meaningful correlation between diet components and disease measures (data not shown).Food avoidance patterns identified a-priori did not seem to impact disease measures (data not shown). 44% RA and 77% controls consumed vegetarian diet (excluding eggs). Patient dependence for diet recall and measure was the important limiation.

Table 1. Women RA subjects and healthy control

Component	Patient (n=115)	Control (n=122)	RDA	P (1)	P (2)
Energy (kilocalorie)	2825	3436	2230	0.02	0.03

Sodium (mg/d)	3156	3180	2012	0.5	0.03
Potassium (mg/d)	1755	3562	3750	0.002	0.00

Conclusions: The diet of RA patients seemed adequate except for an intriguingly low K. We speculate that patients eat lesser vegetables and fruits that source K. K sub serves several physiological functions that may be deranged in RA and contribute to disease progression. This would need further investigation.
Acknowledgements: In contrary to our expectations and reassuringly, the diet of RA patients seemed adequate except for an intriguingly low potassium which should be investigated. We speculate that patients eat lesser vegetables and fruits that source potassium.

AB1229-HPR EVALUATION OF RHEUMATOLOGY NURSE-LED CLINIC IN MANAGING PATIENTS WITH RHEUMATOID ARTHRITIS: A RETROSPECTIVE STUDY

Y.M.E. Leung[1], K.Y. Wong[2], L.S. Tam[1]. *[1]Department of Medicine and Therapeutics, Prince of Wales Hospital; [2]School of Nursing, Hong Kong Polytechnic University, Hong Kong, Hong Kong*

Background: Rheumatoid arthritis (RA) is a chronic, systemic, autoimmune disease characterized by inflammation of the synovial joints. Management of RA patients are usually provided by rheumatologists only. Enhanced care provided by rheumatology nurses between rheumatologist consultations may have beneficial effects in terms of symptom control. In Hong Kong, whether rheumatology nurse care model can favor to patient outcomes remained uncertain.
Objectives: The aim of the study was to examine the clinical effectiveness of rheumatology nurse clinic in controlling disease activity as expressed in change of Disease Activity Score in 28 joints in RA patients compared with usual care led by rheumatologists only.
Methods: This was a retrospective study. Two historical groups of RA patients (30 patients at each group) were identified from attendance records between 1/1/2015 and 20/7/2015 at the rheumatology outpatient clinics. Group 1 comprised of patients who attended rheumatology nurse clinic in between the doctor clinic consultations. Patient education delivered by the rheumatology nurse included disease mechanism, treatment aim, pain management and checking medication adherence according to prescription. RA treatment could also be intensified if needed. Group 2 comprised of patients managed by rheumatologists only. Primary outcomes were changes in disease activity at follow-up visit after the doctor clinic and nurse clinic.
Results: The mean follow-up duration for the study cohort was 20 weeks (median: 22.5 weeks). Patient global assessment and DAS 28 were similar for both groups at baseline. At follow-up, patient global assessment and in the nurse group (Group 1) decreased from mean ± SD: 42±24.7 at baseline to 28.7±24.6 at follow-up, which was approaching the minimal clinically important improvement (MCII= -15). With regards to DAS28, there was a 8.2% decrease (absolute change: -0.38±1.14) in DAS28 in group 1 suggesting a trend of improvement (p=0.081). The corresponding decrease in group 2 was 1.2% (absolute change: -0.05±1.47) and such decrease was not significant (p=0.863). Changes in DAS28 did not exceed minimal clinically important improvement in both groups (MCII= -1.2).
Conclusions: This study demonstrates the short-term benefit of a nurse-led program on RA disease management. Future multi-center studies with a randomized controlled design and a larger sample will be required to confirm our findings.

Abstract AB1229-HPR – Table 1

Variables	Nurse clinic (n=30)			Doctor clinic (n=30)		
	Baseline	Follow-up	p-value	Baseline	Follow-up	p-value
Tender joint count	4 (2, 9)	2.5 (1, 8.25)	0.202	1.0 (0, 6.25)	1.5 (0, 5.00)	0.715
Swollen joint count	1 (0, 3)	0.5 (0, 3)	0.624	1.0 (0, 3.25)	1.0 (0, 4.25)	0.526
Patient global assessment	42.0±24.7	28.7±24.6	**0.009**	42.7±24.9	41.3±23.7	0.838
ESR, mm/hour	35.6±19.2	37.0±22.0	0.639	39.0±19.6	40.7±25.3	0.677
CRP, mg/L	4.6 (1.0, 12)	2.2 (0.7, 8.3)	0.808	2.95 (0.98, 7.00)	3.05 (1.30, 13.1)	0.274
DAS28 score	4.53±1.15	4.16±1.31	**0.081**	4.14±1.01	4.09±1.23	0.863

AB1230-HPR A SURVEY TO ESTABLISH CURRENT PRACTICE IN ADDRESSING WORK ISSUES AMONG PEOPLE WITH INFLAMMATORY ARTHRITIS IN THE IRISH CLINICAL SETTING

Y. Codd[1,2], T. Stapleton[1], R. Mullan[2,3], D. Kane[2,3]. *[1]Discipline of Occupational Therapy, Trinity College Dublin, Dublin; [2]Rheumatology Department, Naas General Hospital, Naas, Co. Kildare; [3]Rheumatology Department, Tallaght Hospital, Dublin, Ireland*

Background: Inflammatory arthritis strongly correlates with work disability. Treatment guidelines recommend work support but data are lacking on rheumatology clinicians' perspectives on work referral and extent of work support within current rheumatology services for this population.
Objectives: To scope the need for and patterns of work referral, and examine the extent and type of work support currently available in Irish rheumatology services for people with inflammatory arthritis. To identify factors that help or hinder employment-related service provision. To explore the role of occupational therapy in addressing work with this population from the perspectives of the other members of the rheumatology team and current practices and challenges.
Methods: A questionnaire concerning work support provision was distributed via online survey to doctors, nurses and physiotherapists working in clinical rheumatology in Ireland.
Results: Response rate of 22% was achieved and total sample of 73 analysed. Respondents indicated that 71% of service users were of working age and the majority of respondents (95%) agreed that addressing employment retention was within the remit of rheumatology services. Over half of respondent (55%) of respondents estimated that 25–49% of their caseload had work needs. Work was usually addressed if clients raised work concerns (94%), client reports work absenteeism (83%), client's work involved manual component (75%). Barriers to addressing work included limited time in clinical setting (92%); unfamiliarity with best practice for work support (91%); lack of perceived competency to assess work complexities (82%). Occupational therapy (OT) was identified as the most appropriate profession to address work (78%). However, 51% respondents reported not routinely referring to OT for work support due to limited availability of OT (13% of responders having no access to OT); uncertainty regarding optimum timing for work intervention, and uncertainty as to what OT could offer regarding work.
Conclusions: Addressing work was recognised as multifaceted and multidisciplinary. Work needs are addressed within current rheumatology services only when the client themselves initiate the issue. Opportunity exists to improve the quality of services to address work in line with guidelines by educating the multidisciplinary team about available work services and implementation of a clinical pathway for employment retention.

HPR patients' perspectives, functioning and health (descriptive: qualitative or quantitative)

AB1231-HPR LIVING WITH RHEUMATOID ARTHRITIS IN SPAIN. A QUALITATIVE STUDY

A. Pedraz-Marcos[1], C. Hale[2], A. Palmar-Santos[1], J. Zarco-Colon[3], M. Ramasco-Gutierrez[4], T. Velasco-Ripoll[5], J. Martín-Alarcón[6], N. Sapena-Fortea[7] on behalf of Grupo de Investigación Cualitativa en Salud (GIQS-UAM). *[1]Surgery, University Autonoma of Madrid, Madrid, Spain; [2]University of Leeds, Leeds, United Kingdom; [3]Sociology, University Autonoma of Madrid; [4]Public Health, Regional Health Organization; [5]Rheumatology, Hospital la Princesa, Madrid; [6]Hospital Clinic Barcelona, Barcelona, Spain; [7]Rheumatology, Hospital Clinic Barcelona, Barcelona, Spain*

Background: The impact of rheumatoid arthritis (RA) on the lives of people is a constant in the studies explored. However, research shows the lack of impact that this has on clinical consultations, despite the influence it may have on the attitude of the person with RA towards treatment adherence. In the Spanish context, except for the study by Devillard & Otegui (1991), the experience of living with RA has scarcely been addressed.
Objectives: To explore the experience of living with RA in Spain.
Methods: In-depth interviews were conducted with a group of patients from two hospitals in the two main Spanish cities: Madrid and Barcelona. The interviews were conducted between April 2014 and February 2015. Thematic analysis was done, identifying the main themes and subthemes and organizing data in a coding framework that allows their interpretation
Results: Patients with disease activity moderate or severe (DAS28 >3.2), and already treated with DMARD, were aged 40–79, 15 were women and 4 men. Three main categories emerged from the discourses. (Table 1)

The symptoms and their management	Helplessness	*How do you live with this? Well, you have to know how to bear it because it is a life of always being tired. [...] You wake up with the body as if you had been beaten.* (EM7)
	Go along with	*When they come [the children], I pretend I'm not doing so badly. I make myself up, I dress up, for they wouldn't notice.* (EB3)
	Self-management	*You have to discover it by yourself, each person what their own experience teaches them.* (EB7)
Daily life	Home adapting	*I had a bath but now I have put a shower. We have set up single lever taps. I bought a step, because I cannot stand on tiptoe to reach something.* (EB8)
	Self image	*Of course, I have changed my shoes, I used to wear heels before, and now I use boots.* (EB8)
	Planning	*Always planning: you are not to improvise under any circumstances.* (EM9)
Therapeutic strategies	The DMARD miracle	*When I take this medicine, I totally revive.* (EM7)
	Ambivalent relation with health professionals	*I had an awful time ... The best thing is people. For me, my rheumatologist is like God.* (EB8) *I'm very frustrated... when they have been wrong with you a lot.* (EM1)

Conclusions: RA patients know well what is it like to get up in the morning, tired, stiff, sore and having to rethink their day. Prioritization and planning activities are key to the organization of the activity and rest. Families and external aid, in case they can afford it, are the most common supports on which the requested supports pivot.
The constant development of new therapeutic strategies and outbreaks of the disease determine the use of an important therapeutic arsenal, with unpleasant side effects, and that should be administered in a hospital setting. This need to rely on medical treatment also extends to doctors, as part of the therapeutic strategy. Nurses are absent from the speeches of our participants
RA patients in our study feel they are mainly on their own to cope with their disease. The new therapeutic strategies have improved the symptoms' control, but they feel they need more than drugs to cope with their daily life. Contrary to the variety of professionals, institutions and organizations that try to empower patients to self manage their disease in other countries, the Spanish attention pivot mainly in rheumatologists.

AB1232-HPR THE EFFECT OF THE DRAINAGE ON PROPRIOCEPTIVE ACUITY INPATIENTS WITH TOTAL KNEE PROSTHESIS

B. Ünver[1], M. Eymir[1], V. Karatosun[2]. *[1]School of Physical Therapy and Rehabilitation; [2]Faculty of Medicine Surgery Medicine Department of Orthopaedics and Traumatology, Dokuz Eylül University, Izmir, Turkey, Izmir, Turkey*

Background: With total knee replacement (TKR) surgery articular cartilage, meniscuses, articular ligaments are removed. Also articular effusion and

hematoma formation increase following surgery. Therefore, proprioceptive acuity decrease after TKR surgery (1). Drainage is a common procedure in TKR, but its effectiveness is controversial. Some studies have claimed that drainage decreases the risk of articular effusion and hematoma formation. However, some studies have demonstrated that drainage increases postoperative blood loss and does not improve the surgical result (2). Several studies have examined the effect of using drainage, but they have not involved improvement in proprioception for patients who had drains compared with those who did not after TKR.

Objectives: The aim of this study was to compare the effect of the drainage on proprioception acuity inpatients with total knee prosthesis.

Methods: The study group consisted of 60 patients (95 knees), who underwent primary TKR because of arthrosis were consecutively allocated to a drainage group (n=26 (41 knees), with median age; 66.23±8.63 years), and were allocated to a non-drainage group (n=34 (54 knees), with median age; 63.97±8.99 years). Patients were evaluated regarding knee proprioception (in knee joint angle 15°, 30° and 60°), knee function score (Hospital for Special Surgery (HSS) score), pain (Numeric Pain Rating Scale (NPRS)), knee circumference, knee range of motion. Functional activities were evaluated using the Iowa Level of Assistance Scale and walking speed was evaluated using the Iowa Ambulation Velocity Scale. Patients were evaluated preoperatively and at discharge. All patients underwent the same rehabilitation program.

Results: At baseline, demographic and anthropometric characteristics were similar in groups and there was no statistically difference between groups ($p>0.05$). When knee proprioceptive acuity measurements (in knee joint angle 15°, 30° and 60°) were compared before and after surgery, there was no statistical differences in proprioceptive acuity between groups ($p>0.05$). It was determined that; the drainage group had better results in terms of reduction of pain severity after surgery ($p<0.001$). When the HSS knee scores were compared there was statistically difference between groups ($p=0.001$) and the HSS knee scores were lower in non-drainage group after surgery. There were no statistical differences in knee circumference, knee range of motion, the IOWA help level score and IOWA walking speed score between groups after TKR ($p>0.05$).

Conclusions: According to our results, the use of drainage did not improve the knee proprioceptive acuity inpatients with TKR. But, it is suggested that using drainage decreases pain severity and improves the HSS knee score. Also the use of drains has no effect on patients' outcomes after TKR, in terms of improvements knee range of motion, knee circumference, functional activities and walking speed.

AB1233-HPR COGNITIVE COMPLAINTS IN PATIENTS WITH ACTIVE SYSTEMIC LUPUS ERYTHEMATOSUS AND PAST NEUROPSYCHIATRIC SYMPTOMS

D. Usheva[1], D. Ivanova[2], J. Petrova[3]. *[1]MU Sofia, Sofia, Bulgaria; [2]Rheumatology, MU Sofia; [3]Neurology, University Hospital Alexandrovska, Sofia, Bulgaria*

Objectives: Cognitive complaints are common in patients with systemic lupus erythematosus (SLE). Their association with disease and non-disease related factors have been inconsistently reported. We studied their relation to disease related factors including disease activity, neuropsychiatric history and non-disease related factors such as anxiety or depression.

Methods: We used cognitive symptoms inventory (CSI) for measuring cognitive impairment at 3 time-points 12 months apart/2015–2016/ and Hospital Anxiety and Depression Scale (HADS)-HADS-A and D.Disease activity was measured by SLEDAI.

Results: 93 SLE patients were recruited at baseline (T0). Among them 59 had first re-evaluation (T1) and 34 had second re-evaluation (T2) at 12-month interval. Majority (72%, 24/34) of patients had stable CSI whereas 5.5% (2/34) of patients worsened CSI over 12 months. At T0, multivariate analysis revealed that higher CSI was associated with history of NPSLE ($p=0.005$) and psychiatric disease ($p=0.04$), higher HADS-A ($p<0.001$) and HADS-D ($p<0.001$) scores. CSI of active patients (SLEDAI>6) was not different from inactive patients. It did not change despite regression of disease activity in 12 months. There was no difference in CSI between T0 and T1 regardless of history of NPSLE, change in anxiety and depression at T1 (HADS-D>11 as cutoff).Multivariate linear regression analysis revealed change in HADS-A as the only significant predictive factor of change in CSI over time ($\beta=0.774$, 95% CI 0.43 – 1.12, $p<0.001$).

Conclusions: 11.5% of SLE patients reported persistent cognitive symptoms.CSI had worsened in patients with NPSLE and psychiatric illness, anxiety or depression.

AB1234-HPR PHYSIOTHERAPY EFFECTS ON GAIT SPEED AND PAIN IN PATIENTS WITH KNEE OSTEOARTHRITIS THREE DAYS AFTER APPLYING KINESIOTAPE

K. Tani[1], I. Kola[2], F. Dhamaj[2], E. Qalliaj[1], K. Zallari[2]. *[1]University of Medicine, Tirana, Albania; [2]Faculty of Technical Medical Sciences, University of Medicine, Tirana, Albania*

Background: Knee osteoarthritis is a chronic degenerative disease, known as the most common cause of difficulty walking in older adults and subsequently is associated with slow walking, also one of the most main symptoms is a degenerative and mechanics type of pain. Pain is very noticeable while walking in rugged terrain, during ascent and descent of stairs, when changing from sitting to standing position as well as staying in one position for a long time. Many studies have shown that the strength of the quadriceps femoris muscle can affect gait, by improving or weakening it. Kinesiotape is a physiotherapeutic technique, which reduces pain and increases muscular strength by irritating the skin receptors

Objectives: The aims of this study was firstly to verify if the application of Kinesiotape on quadriceps femoris muscle increases gait speed in patients with knee osteoarthritis and secondly if applying Kinesiotape on quadriceps femoris muscle reduces pain while walking.

Methods: 73 patients with primary knee osteorathritis, aged 50–73 years, participated in this study. Firstly we observed the change of gait speed, while walking for 10 meters at normal speed for each patient, before and three days after the application of Kinesiotape on quadriceps femoris muscle, with the help of the 10-meter walk test. Secondly we observed the change of pain, while walking for 10 meters at normal speed for each patient, before and three days after the application, with the help of Numerical Pain Rating Scale-NRS.

Results: Our results indicated that there was a significant increase of gait speed while walking for 10 meters one day and also three days after application of Kinesiotape, also there was a significant change of pain. Before applying Kinesiotape on quadriceps muscle was shown that 41.1% chose score 6, 30.1% chose score 7 and 28.8% chose score 8 of the numerical pain rating scale. Three days after the application 15.1% chose score 2, 37% chose score 3 and 47.9% chose score 4 of numerical pain rating scale.

NRS	Number of patients before KT	%	Number of patients three days after KT	%
0				
1				
2			11	15.1
3			27	37
4			35	47.9
5				
6	30	41.1		
7	22	30.1		
8	21	28.8		
9				
10				

Conclusions: Our results indicated that there was a significant decrease of pain and increase of gait speed while walking for 10 meters. Kinesio-Tape can be used in patients with knee osteoarthritis, especially when changing walking stereotypes is a long term goal of the treatment.

AB1235-HPR SEXUAL DISTURBANCES IN PATIENTS WITH RHEUMATOID ARTHRITIS AND IT'S RELATION WITH DISEASE ACTIVITY

L. Villarreal[1], S. Henao[2], D. Buitrago-Garcia[3], P. Santos-Moreno[4]. *[1]Psychology and processes; [2]Patient service; [3]Epidemiology; [4]Rheumatology, Biomab, Center for Rheumatoid Arthritis, Bogota, Bogota, Colombia*

Background: Sexuality is an important dimension of personality and human body, therefore any involvement in this area should be considered as important. Sexual disturbances in rheumatoid arthritis (RA) patients are poorly described in literature. In other chronic conditions studies had shown that sexual disturbances can be common problem in but, sexual dysfunction has a high risk of under treatment because providers frequently do not initiate the conversation with the patient.

Objectives: The purpose of this study was to describe sexual disturbances in

population with RA and a possible correlation with disease activity in a specialized rheumatology center.
Methods: A descriptive cross-sectional study was performed in a specialized clinic dedicated to care patients with rheumatoid arthritis (RA). Data was collected during a two year period at a psychology consultation, through semi-structured interview. Descriptive epidemiology was applied for continuous variables, using measures of central tendency and dispersion for categorical and qualitative variables by averages and percentages. We analyzed bivariate association with Pearson's X^2.
Results: We included 1398 patients attending to our psychology consultation. Mean age was 55 years ± 8; 80% were female and 20% male. Mean DAS28 was 2.6±1.3, mean HAQ was 1.6±1.6; patients had the disease for an average of 12 years ± 8; 41% of patients had comorbidities associated with non-autoimmune disease, 14% comorbidities related to autoimmune disease; 35% of our patients did not report other comorbidities. Most of patients were married 60%, followed by divorced 19%, single 14% and widowed 7%. Regarding occupation 33% were employees, 25% were housekeepers or retired due to age, 12% were retired due to disabilities, and 3% unemployed. Of the total population 45% had elementary school, 32% high school, 8% college education, 7% graduate education and 7% were illiterate. 17% of patients lived alone. Concerning sexual disorders, 38% reported no to have any sexual activity, 32% reported to have a satisfactory sexual life, 11% dyspareunia,9% had an unsatisfactory sexual life, 5% loss of desire, 3% premature ejaculation and 2% orgasmic decrease. Regarding predisposing factors of sexual disorders 63% of our population did not present any, 11% had insecurity related to the sexual role, 10% inadequate information relating sexuality, 10% infidelity and 6% physical and biological predisposing factors. Regarding precipitant factors of sexual disorders 63% report no to have any, 19% had biological or physical factors, 12% infidelity, 3% inadequate information and 3% insecurity related to de sexual role. There was no statistical association between disease activity and predisposing or precipitant factors.
Conclusions: We found that a third of patients with AR have sexual disorders and a high percentage reported not having any sexual activity. Also, it is important to have a multidisciplinary care team for the patient with RA, including a psychologist and a sexologist for managing this kind of illness in order to improve the life quality of patients.

AB1236-HPR CONNECTION BETWEEN FUNCTIONAL ABILITY AND SOCIO-DEMOGRAPHIC DATA IN PATIENTS WITH RA IN SLOVENIA

M. Pavic Nikolic, S. Kosir Jost. *Department of Rheumatology, University Medical Centre Ljubljana, Ljubljana, Slovenia*

Background: Rheumatoid arthritis (RA) is the most common chronic inflammatory arthritis, characterized by progressive, destructive course when left untreated, resulting in severe patient disability and significantly reduced quality of life. RA has an important impact on work ability and economic status of patients.
Objectives: In our study we were focused on specific consequences of arthritis in terms of functional ability and we were looking for correlation with socio-demographic data.
Methods: The study was conducted between January 2016 and May 2016 at the Department of Rheumatology, UMC Ljubljana and included patients with RA. Data were collected using Arthritis Impact Measurement Scales 2 (AIMS2) questionnaire.
Results: One hundred RA patients (76% women, mean age (SD) of 61.1±15.29 years) participated in the study. Disease duration was ± 5. 6 year. Most of our patients were married, retired with elementary education and lower incomes (Table1).

Table 1. Socio-demographic status of respondents

Married status/n		Education level/n		Working status/n		Monthly revenue/n	
Married	70	Primary school	40	Employed	27	up to 500€	32
Divorced	3	High school	27	Housekeeper	2	500€–900€	42
Single	6	University	27	Student	1	900€–1300€	19
Widowed	19	Master's degree	3	Unemployed	5	1300€–1700€	4
Separate life	2	Doctor's degree	3	Retired	65	1700€ and up	3

Respondents of our study described their functional ability good by the average of the entire sample 2.06. This value shows us a relatively good functional ability of patients most days or very often. Patients had some problems with function of hand and wrist in particular by opening jars (43%) and on area walking and bending with intensive activity (42%). Correlation between functional ability and socio-demographic data show us some statistical deviance in age group 41 to 50 year (p=0.94), in patients with higher education level (p=0.99) and in group of patients who monthly earns more then 900€ (p=0.96). But we didn't find any statistically significant difference in the entire sample including patients treated with biological drugs (functional ability patients on biologics p=0.91).
Conclusions: We found fairly good functional ability of patients; which might be explained by relatively short duration of RA. The most important functional-related issues from patient perspective were identified. Despite that we not find a statistically significant relationship between socio-demographic data and functional ability of patients, it is very important that we pay attention on socially unprivileged patients and we offer our support in managing disease.

AB1237-HPR POSTURAL STABILITY AND ANKLE PROPRIOCEPTION IN DIFFERENT SUBGROUPS OF SUBJECTS WITH HALLUX VALGUS

O. Aydoğdu, Z. Sarı, G.M. Polat. *Physiotherapy and Rehabilitation, Marmara University, Health Sciences Faculty, Istanbul, Turkey*

Background: Hallux valgus (HV) is lateral deviation of the great toe towards the second with subluxation of the first metatarsophalangeal joint and medial deviation of the first metatarsal (1). Increasing HV severity has been shown to negatively impact on health-related quality of life and self-reported function, and HV has been linked to increased falls risk in older adults (2). HV, in particular, is associated with poorer performance during postural stability and functional testing in older adults (3).
Objectives: Despite the findings of impaired postural stability in older adults with hallux valgus, the links between functional status and postural stability, ankle proprioception are not well established in HV. One of clinical significance of this study was to determine whether impaired postural stability was caused by deficits in ankle proprioception and impaired functional status in HV subjects. Our purpose of this study was to assess postural stability and ankle proprioception in different subgroups of HV. In this study, we hypothesized that subjects with severe deformity would exhibit poorer postural stability and ankle proprioception performance compared to subjects with mild and moderate deformity in HV.
Methods: Thirty-five adults diagnosed with unilateral HV according to the Manchester Oxford Foot Questionnaire deformation grade 2 and on were participated in the study. They were distributed among three groups: Mild (grade 2), moderate (grade 3), and severe deformity (grade 4). Functional status was measured with a disease specific score (the hallux valgus scale of the American Orthopaedic Foot and Ankle Society). While postural stability was measured with Pedalo Sensamove® System, ankle proprioception was measured with Biodex Balance System Pro 4.
Results: Subjects in HV with severe deformity group showed poorer postural stability performance than those in HV with mild (p=0.024) and moderate (p=0.039) deformity groups. However, there was no significant difference between the groups in ankle proprioception. There was a significant correlation between postural stability and functional status ($p<0.05$, r=0.771) in all subjects with HV. In addition, it was found that ankle proprioception was not correlated to functional status and postural stability ($p>0.05$).
Conclusions: It has been concluded that HV with severe deformity affects postural stability according to the results of our study. On the other hand, ankle proprioception is not as an important predictor as postural stability for rehabilitation in different subgroups of HV. Therefore subjects in HV with severe deformity should be focused on stability exercises, in particular, in addition to home – based exercise programs, foot orthoses, footwear recommendations, and patient education in their rehabilitation.

AB1238-HPR PEOPLE'S PERCEPTIONS OF THEIR PHONE CALL WITH RHEUMA DIRECTLY, A RHEUMATIC DISEASES HELPLINE

S. Arvidsson[1,2], M. Nylander[2], S. Bergman[1,2,3]. *[1]School of Health and Welfare, Halmstad University; [2]Spenshult Research and Development Centre, Halmstad; [3]The Sahlgrenska Academy, University of Gothenburg, Gothenburg, Sweden*

Background: Information on rheumatic diseases is often complex to understand or scary, and additional support is often necessary. Rheuma Directly (RD) is a helpline with specially trained nurses on rheumatic diseases, funded by the Swedish Rheumatism Association and Spenshult Research and Development Centre. Little is known of how people calling a helpline perceive the contact.
Objectives: To describe the variation in how people perceive the contact with the helpline RD.
Methods: The study had a descriptive, qualitative design with a phenomenographic approach and was carried out by means of 27 semi-structured telephone interviews. The informants were 22 female and 5 men, and their ages ranged from 22 to 89 years (mean 54 years).
Results: The informants called RD when they had problems getting answers

to their questions through the Internet or from healthcare professionals. Three different description categories emerged: Specific competence, Constructive dialogue, and Applicability. The informants' perceived Specific competence when the nurses were knowledgeable, the call was complementary to previously received information and when the informants had greater knowledge after the contact with RD. They perceived that it was a Constructive dialogue when they got someone to discuss with, a "sounding board", and perceived emotional support, felt reassured and were satisfied with the answer. The informants perceived Applicability because RD was available and they could make different choices according to their own desire; before (how and when they would contact RD), during (what to tell and what question they would ask) and after (how and what they would do after the contact with RD).

Conclusions: People calling RD perceived that the telephone call with the nurses meant meeting specific competence, gaining constructive dialogue and that the helpline was applicable. This knowledge ad to a fuller understanding of factors that from a caller's perspective, are important when calling a helpline with specially trained nurses on rheumatic diseases.

AB1239-HPR FATIGUE AT DIAGNOSIS OF INFLAMMATORY JOINT DISEASES - A PREDICTOR OF FATIGUE DURING THE COURSE OF DISEASE DESPITE OF LOW DISEASE ACTIVITY

S.H. Jakobsen, A. Emamifar, I.M.J. Hansen. *Rheumatology, OUH, Svendborg Hospital, Svendborg, Denmark*

Background: Fatigue is a common symptom in patients suffering from inflammatory rheumatic diseases. Several patients still present with fatigue, although they are well treated with anti TNF-therapy (1).

Objectives: To investigate disease-related aspects of fatigue in patients with inflammatory rheumatic diseases using the Functional Assessment of Chronic Illness Therapy-Fatigue (FACIT-F) with the aim later to develop methods to improve the patients quality of life in a more specific way.

Methods: All patients with inflammatory diseases including Rheumatoid Arthritis (38) and Spondyloarthropathy (13) and Psoriatic arthritis (2) treated with Intravenous biologic from 15.10 until 31.12.16 were invited to fill out the FACIT-F questionnaire during intravenous (IV) infusion of the drugs in the rheumatology outpatient clinic. Furthermore hemoglobin and disease activity score were extracted from patients electronic records.

Results: Of 72 patients, 53 patients completed the questionnaire. 5 patients did not want to participate. In 11 patients treatment was discontinued during the study and 3 patients were not able to answer the questions.

Patients with a fatigue score of <30 had few problems with any of the subgroups within the FACIT-F questionnaire (A-E), whereas more than 30% of patients with a fatigue score of ≥ 30 had challenges in one of the FACIT-F subgroups (somewhat, quite a bit and very much) A. Physical well-being: lack of energy and troubles with meeting the needs of their family because of their physical condition. B. Social/family well-being: patients were not feeling close to their friends, not getting enough emotional support from their family and not satisfied with their sex life. C. Emotional well-being: patients worry if their conditions might get worse. D. Functional well-being: patients feel they are partly unable to work, not satisfied with their performance at work and they have sleeping and quality of life problems. E. Additional concerns: patients had problems with fatigue, weakness, tiredness, starting and finishing things because of tiredness, not having energy, not being able to do usual activities, frustration by being too tired to do the things they want to do as well as they want to limit social activities because of tiredness and they need to sleep during the day. Furthermore, there was a moderate correlation between fatigue at diagnosis and fatigue at time of data extraction ($r = 0.53$). The fatigue was not correlated with anemia or high disease activity.

Conclusions: Our results demonstrated that patients with a fatigue score of >30 had different challenges mentioned in the fatigue questionnaire. In addition, patients who experience fatigue at time of diagnosis, they often remain fatigue, provoking the thought that fatigue is not correlated with inflammatory joint disease. Maybe more explorative questions about fatigue at the consultation could be a part of improving the patients'quality of life.

AB1240-HPR PATIENTS' DOGMA, NUMBER OF SWOLLEN JOINTS AND PHYSICIANS' AND PATIENTS' AGE PREDICT NON-ADHERENCE TO MEDICINES AND NON-PHARMACOLOGICAL INTERVENTIONS IN RHEUMATOID ARTHRITIS – A MIXED METHODS STUDY

V. Ritschl[1], A. Lackner[2], C. Boström[3], M. Kundi[4], P. Studenic[5], J. Smolen[5], T. Stamm[1]. *[1]Institute of Outcomes Research, Center for Medical Statistics, Informatics, and Intelligent Systems, Medical University of Vienna, Vienna; [2]Department of Rheumatology, Medical University of Graz, Graz, Austria; [3]Department of Neurobiology, Karolinska Institute, Huddinge, Sweden; [4]Institute of Environmental Health, Center for Public Health; [5]Division of Rheumatology, Department of Medicine 3, Medical University of Vienna, Vienna, Austria*

Background: In rheumatoid arthritis (RA), up to 80% of patients were found to be non-adherent to prescribed medication and non-pharmacological recommendations. These patients do not achieve an optimal clinical outcome.

Objectives: In the present study, we therefore explored predictors that may lead to non-adherence to both medicines and/or non-pharmacological recommendations.

Methods: In a mixed methods study, retrospective observational data from patients meeting the ACR/EULAR criteria for RA who were non-attenders/missed the routine check up visits for at least 9 months to the rheumatology clinic and had had an initial DMARD therapy were queried of the databases of two rheumatology centers in Austria (Graz, Vienna). Subsequently, we invited all patients to take part in a qualitative semi-structured interview study with a meaning condensation data analysis. In the interviews, patients were assigned to the subgroups "adherent" (e.g. having regular rheumatology visits in another clinic) or "non-adherent" (e.g. having stopped taking the prescribed medication). Possible predictors derived from the qualitative analysis and the retrospective observational data were then tested in a logistic regression model.

Results: In total, data of 459 patients (346 [75.4%] females; mean age 63.0 [SD± 14.8]) were extracted out of the databases. 131 patients (109 [83.2%] females; mean age 64.8 [SD± 14.1]) participated in the qualitative interviews. In addition to already known themes, new topics arose from the analysis: (i) patient's dogma inhibited adherent behavior, in that patients felt that pain was an important part of life and attributed to having had a high manual workload during life of which patients were proud; (ii) patients had less trust in physicians when they were seeking support from other physicians, because they appeared to be "young or unexperienced"; (iii) Some patients did not feel properly understood if physicians only prescribed medication without giving advice on non-pharmacological aspects of treatment.

Two clinical variables were found to be predictors for non-adherent behavior (table 1): swollen joint count (patients with higher numbers of swollen joints were less adherent) and age (younger patients were less adherent).

Table 1. Logistic regression models. Odds ratios of relevant factors for non-adherent behavior in RA: results of the logistic regression analysis

Regression Model	Odds Ratio	CI 95%	Significance at 0.05 (p)
Age at the last visit	1.033	1.005 to 1.063	0.022
Swollen Joint Count using a 32 joint count form	0.876	0.767 to 1.000	0.050

Conclusions: In order to achieve a good clinical outcome, it is important to provide evidence based treatment recommendations, but also to ensure adherence to these. The predictors found in our study could be used to enhance patient adherence and therefore improve clinical outcome.

AB1241-HPR EVALUATION OF PATIENT COMPLIANCE WITH LONG TERM PRESCRIBED RHEUMATIC MEDICATION AT LOCAL LONDON HOSPITAL RHEUMATOLOGY UNIT

V. Sohdi, C.B. Colaço, M. Hoffman, J. Kirk on behalf of Central Middlesex Hospital Rheumatology (Patient) Support Group. *LNWHT, London, United Kingdom*

Background: Non-Compliance with Long term medication is reported as high 60% (1). Health belief model suggests four elements contribute to this problem. The Beliefs About Medicines Questionnaire (BMQ) is a tool for evaluating people's beliefs about medicines (1).

Objectives: A Service Evaluation of compliance with prescribed medication for Long Term Rheumatologic Conditions at Central Middlesex Hospital. This was conducted to assess any possible relationship between compliance with medicines and beliefs or concerns or patient's ethnicity.

Methods: The design was a voluntary self-reported, cross-sectional paper based questionnaire survey of people with Rheumatic Conditions. Twelve questions were grouped within three categories (healthcare utilisation, necessity beliefs and concern beliefs) to capture compliance behaviour for later analysis and comparison.

The Beliefs about Medicines Questionnaire was adapted from ref (1) to distinguish patients beliefs of 'necessity' or 'concerns'. In line with principles of PPP, the questionnaire was discussed prior to the audit with a sample focus group of 5

patients who contributed to the wording and the simplification of the questions re: ethnicity.
Questionnaires were offered to all patients attending the CMH Rheumatology Unit. The evaluation was discontinued when a target of 100 was reached (n=102). No questionnaires were excluded. And upto 5% of questions were unanswered. Data was analysed on SPSS.
Results: The Number of questionnaires returned for this service evaluation was 102.
- Most respondents (94%) showed compliance with rheumatic medication as prescribed.
- More than half the respondents (66%) agreed or strongly agreed that their arthritis medications are necessary for their health.
- 54% were concerned about potential adverse consequences.
- The overall necessity score (19.32 S.D. 3.17) was higher than the concerns score (13.48; S.D. 3.35; t =61.57, P<0.001).
- Concerns about the long term effect of rheumatic conditions correlate positively with perceptions of health in the future P<0.01 level (2-tailed Pearson).
- No significant correlation was found between compliance and patient's ethnicity/individuals demographics.

Conclusions: Most people with Rheumatic conditions have positive beliefs about the necessity of their medication. However, levels of concern are high, especially towards the long-term effects of the medication. This concurs with asimilar study in Rheumatoid Arthritis.(2). The service evaluation using the Beliefs about Medicines Questionnaire has helped to identify people at risk of poor compliance long term. This illustrates a need to discuss patients beliefs and concerns in targeted drug counseling sessions with specialist nurses. A post study patient focus group recognised the high level of compliance yet recommended a fixed weekly walk in session with a nurse and pharmacist to sustain this high quality outcome. Further methods of continued patient re-education will be explored.

HPR service developments, innovation and economics in healthcare

AB1242-HPR NUMERICAL PREDICTION OF THE OPTIMUM SHEET METAL THICKNESS IMPLANTED AS THE JOINT CARTILAGE

M. Moayedfar, A.M. Rani, H. Hanaei. *Mechanical Engineering, Universiti Teknologi Petronas, Bandar Seri Iskandar, Malaysia*

Background: The combination of computer-aided-design (CAD), digital image processing techniques and finite element method (FEM) has been successfully employed to create the customized distal condyle implants in human joints during arthroplasty surgery when the manufacturing method is incremental sheet forming (ISF) technique. However, due to the high time of process in the FEM analysing of human joints, finding the optimum material thickness with respect to the joint cartilage has been neglected.
Objectives: To apply a numerical investigation based on the FEM to predict and propose the sheet metal thickness for joint cartilage in the ISF process in a timely method for the human knee as a case study.
Methods: To reduce the expense of experiments and save the time of production, a numerical investigation method based on FEM is designed for the ISF. The user subroutine is employed to navigate the tool motion and material behaviour for reducing the time of simulation in the analysing tool. Hence, the sequence of FEM applied was as follow. 1) Create the solid model of the clamping system and sheet metal. 2) Choosing associated nodes together with Shell elements to increase the accuracy of the simulation and simplify the process. 3) Applying the specifications of every element. 4) Assign and render the material properties for sheet metal. 5) Apply the initial boundary conditions. 6) Assigning the asymmetric boundary conditions using the subroutine for time reduction purpose. 7) Apply the loads related to the complete FEM. Consequently, the proper thickness from MRI based on the previous study is sent to the CAD system for the mechanical and anatomical modification.
Sheet metal thickness and also material selection were based on the joint mechanical properties, shape and size. Therefore, by using the optimum pressure profile, the FEM can be performed to predict the sheet stretch and also shear failure to illuminate the optimum sheet thickness used in customized medical implants.
Results: The result of this study is based on the validation of predicted sheet thickness with the real patient cartilage thickness. This result showed a good agreement with the hospital data (for cartilage thickness of ~2.20mm) and simulation result (~2.23mm for sheet thickness). It was not possible to divide the model into some sections and only analyse one particular part as a sample. Therefore, the time of calculation was 23 hours for FEM when a high-performance computer was used. Regarding the same issue, the mesh was not uniform distributed so the time of analysing for each particular location was not the similar and predictable. The shear failure happens on the edge of design and also some locations that a turning point existed.
Conclusions: A numerical simulation is required to predict the material thickness replaced with the joint cartilage. Thus, the mathematical solution is investigated to predict the sheet thickness in the customized production process. Therefore, the result showed 98.5% similarity thickness of sheet metal with cartilage.

AB1243-HPR USING INFORMATION-COMMUNICATION TECHNOLOGIES AND OPPORTUNITIES FOR TELEREHABILITATION IN OCCUPATIONAL THERAPY

B. Huzjan. *Department of Rheumatology, University Medical Centre Ljubljana, Ljubljana, Slovenia*

Background: The use of information and communication technology (ICT) in occupational therapy should allow management of chronic diseases by providing support programs in education including the use of multimedia services.
Objectives: In order to determine the presence of information and communication technologies use in the options of telerehabilitation, a survey was conducted 224 newly diagnosed patients with rheumatoid arthritis (RA).
Methods: The quantitative research approach was used with the newly created detected patients with RA treated on Department of Rheumatology at the University Medical Centre Ljubljana. The questionnaire included basic demographic information and questions about the use extent and possibilities for using ICT. The population also accounted for patients with RA diagnosed between 1 January 2014 and 31 December 2015. The data obtained was statistically analysed with the SPSS program IMB 20. The total of 64 survey questionnaires were completed, which represents 28% of the selected population.
Results: 23.4% RA patients don't use internet. 48.4% RA patients use personal computers (PC), and 51.6% patients use smart phones. 35.3% of patients that use PC use it for e-mailing, searching health information (35.4%), video calls (13.3%) and sending messages (15%). Patients who use smart phones use them for calls (31.9%), texting and calls (26.7%), e-mailing (25%), searching health information (12.9%), and video calls (3.4%). There is a positive correlation between the use of modern ICT and the opinion that the interviewed patients would use telerehabilitation services during their rehabilitation. Pearson correlation coefficients are statistically significant with all the ICT. With using a PC (r =0.602) and smart phones (r =0.542) there is a medium strong positive correlation Positive coefficients indicate that the surveyed patients who are increasingly using ICT think they could help themselves with telerehabilitation. Increased frequency of ICT usage is associated with potentially greater possibility of using telerehabilitation.
Conclusions: The need for rapid access and exchange of information is the main reason for the use of information and communication technologies in healthcare, and is conditional for the development of e-health. Research provided answers questions about the possibilities of using information and communication technology and rehabilitation services at a distance – telerehabilitation in occupational therapy.

AB1244-HPR GUIDED SELF-MANAGEMENT FOR PATIENTS WITH RHEUMATIC INFLAMMATORY DISEASES AND FATIGUE – A PILOT PROJECT

E. Fjerstad[1], R.H. Moe[2,3], S. Nymo[4], T. Berge[5]. *[1]Enhet for psykiske helsetjenester i somatikken, Diakonhjemmet Hospital, Oslo, Norway; [2]Rheumatology, NKRR, Diakonhjemmet Hospital, Oslo, Norway; [3]Rheumatology, NBRR, Diakonhjemmet Hospital, Oslo, Norway, Oslo; [4]Drammen Hospital, Dronninggata 28, 3004 Drammen, Drammen; [5]Enhet for psykiske helsetjenester i somatikken, Diakonhjemmet Hospital, Oslo, Norway*

Background: Fatigue is reported to be a common symptom in people with inflammatory rheumatic diseases. It is a complex symptom, characterized by an individual interplay of biopsychosocial factors that has been associated with factors like inflammation, deconditioning, sleep problems, decreased function, pain and psychosocial factors like depression.
Objectives: The main objective was to contribute to improved coping and quality of life in people with inflammatory rheumatic disease and fatigue. Cognitive therapy is one of the common psychological interventions used in the rehabilitation

of people with rheumatic diseases and fatigue. The current intervention was developed as a supplement to medical treatment to strengthen coping and quality of life, and reducing fatigue, depression and pain.
Methods: People with inflammatory rheumatic diseases and fatigue were recruited for 6–9 sessions of cognitive therapy sessions, in addition to treatment as usual at a rheumatology outpatient clinic in Norway. The intervention aimed at reducing fatigue, depression and pain, consisted of four main elements; understanding fatigue, assessment and activity planning, mental and cognitive self-help skills. The project was developed, and data collected at the rheumatology outpatient clinic at Diakonhjemmet Hospital in 2014–2016.
Results: This pilot project recruited 40 people with inflammatory rheumatic disease from a rheumatologic outpatient clinic in Norway. Participants had a disease duration of mean 14 years, they were mainly women (n=36) with a mean age of 45 (Standard Deviation =10) years (Table 1). Repeated ANOVA analyses and Paired t-tests showed promising statistically significant changes on a group level for fatigue and depression, not for pain (Table 2).

Table 1. Demographic data of included patients (n=40)

N=40	Mean values
Age (SD)	45 (10)
Women (men)	36 (4)
Disease duration (years)	14 (11)

Conclusions: This pilot project supports the idea of conducting a trial on the effectiveness of a brief cognitive therapy intervention for people with inflammatory rheumatic diseases and fatigue. ANOVA analyses and Paired t-tests showed promising statistically significant changes on a group level for fatigue and depression, but not for pain, whether these changes are clinically meaningful, and if there is a difference, compared to treatment as usual remains to be explored.
Acknowledgements: This project would not have been possible without the support from the national patient organization, through a grant from the Norwegian ExtraFoundation for Health and Rehabilitation. We acknowledge patients who contributed to this project and the staff at the rheumatological outpatient clinic at Diakonhjemmet Hospital.

AB1245-HPR NEW HEALTH TECHNOLOGIES AND LIFESTYLE MANAGEMENT FOR PATIENTS WITH OSTEOARTHRITIS

M. Loiskandl[1], H. Ritschl[2], T. Stamm[1], G. Steiner[1], J. Smolen[1], D. Aletaha[1].
[1]Rheumatology, Medical University of Vienna, Vienna; [2]Joanneum, University of Applied Sciences, Graz, Austria

Background: Osteoarthritis (OA) is one of the most common chronic diseases of the elderly worldwide. It represents significant impairments in terms of quality of life [1]. It notably affects self-care-tasks, body-image, self-esteem, well-being, social-activities and relationships. A wide-ranged field of therapy concepts exist. Medication is often one part, but it cannot solve other existing problems due to OA [2]. The demographic trends combined with the growth of mobile devices among the older population suggest that using digital devices, as a platform for interventions in health, may be a viable way forward and open new opportunities in healthcare [2].
Objectives: To (A) analyse the literature to assistive devices and applications for OA patients and (B) to evaluate existing health applications.
Methods: We performed a systematic literature review on this topic and explored existing mobile and web-based apps. The app findings were classified into those categories of the Activities of Daily Living Model, which were related to the impairments of OA.
Results: We identified 6 studies, which contained relevant information. The main results showed, that there is interest and willingness to utilize mobile Health solutions [3]; a positive impact of web-based interventions; the benefit of online social support regarding the level of patient empowerment [4], self-management, lifestyle, physical activity [5] and self-efficacy [6].
The app exploration results in 16 web-based, 15 iOS and 9 Android applications. The areas most commonly found were disease- and treatment information (n=23), forum, report, self-help groups (n=16), self- and disease-management (n=11), as well as nutrition tips (n=8).
Conclusions: The recent years have seen a dramatic growth of digital applications. Also, the scientific interest has grown and numerous studies emphasise the power of these solutions to support OA patient in all areas of lifestyle management. Further research is necessary, to investigate the benefit of web-based or mobile applications for persons with OA.

AB1246-HPR INTRA ARTICULAR OZONE OR HYALURONIC ACID INJECTION: WHICH ONE IS SUPERIOR IN PATIENTS WITH KNEE OSTEOARTHRITIS? A 6-MONTH RANDOMIZED CLINICAL TRIAL

S.A. Raeissadat[1], S.M. Rayegani[2], M. Moridnia[3], S. Rahimi Dehgolan[4].
[1]Physical Medicine and Rehabilitation Department, Shahid Modarres Hospital; [2]Physical Medicine and Rehabilitation Department, Shohadaye Tajrish Hospital; [3]Deputy of Education; [4]Physical Medicine and Rehabilitation Department, Shahid Beheshti University of Medical Sciences, Islamic Republic Of

Background: Knee osteoarthritis (OA) is a common disease with great burden through pain and decreased function (1). Except for knee replacement surgery as a definite treatment (2), there are many other therapeutic modalities including non-pharmacologic choices and some heterogeneous drugs like oral, topical and intra articular ones (3). Recent studies have showed promising results of ozone application in OA (2,4–5).
Objectives: The aim of this study was to compare the effects of ozone therapy versus hyaluronic acid (HA) intra articular injection in patients with knee OA.
Methods: This prospective RCT studied 174 patients in two random groups: ozone and HA. We performed three weekly injections of Hyalgan® versus 10 ml of ozone solution in moderate knee OA patients. Participants were primarily evaluated and 6 months after injection using pain, stiffness and function questionnaires.
Results: No major adverse events were noted in the study. Total WOMAC score decreased in the ozone group from 40.8±9.8 to 20.4±4.9 ($p<0.05$) and in the HA group from 38.5±7.9 to 17.1±4.2 ($p<0.05$). A similar trend was observed in pain improvement according to VAS (table 1). Pain, stiffness and function significantly improved in both groups but no differences were found between groups.
Conclusions: Although both ozone and HA can be effectively used for improving function and reducing pain in selected patients with knee OA, neither of the two showed no superiority at 6 months follow up.

HPR professional education, training and competencies

AB1247-HPR AN INTEGRATED APPROACH IN CUSTOMIZED MEDICAL FEMORAL COMPONENT PRODUCTION TO MINIMIZE THE CONDYLE CUT OFF DURING THE TKA

M. Moayedfar, A.M. Abdul Rani. *Mechanical Engineering, Universiti Teknologi Petronas, Bandar Seri Iskandar, Malaysia*

Background: To prepare the femoral component during the Total knee arthroplasty (TKA), it is needed to cut off the damaged condyle to a dimension matched with one of the available implant sizes in the market. Since there is a variety of humans' knee size and shape, therefore, some parts of the distal femoral are over cut. The solution to this problem is customisation of the implants via a cohesive procedure specifically designed for medical orthopaedic implant production.
Objectives: This research aims to provide a fully integrated system of digital image processing of Magnetic Resonance Imaging (MRI) data and Finite Element Method (FEM) for testing and analysing prior to manufacturing of customized medical femoral component.
Methods: An automatic algorithm to segment MR images from end-of-femur condyle is developed and employed for 3D reconstruction followed by computer-aided design (CAD) system, FEM and incremental sheet forming (ISF) process. In femur segmentation, multi-resolution edge detection is applied that extracts all the edges at bone surfaces. The edge detection process followed by the selection and extraction of strong edges with enhanced active contour technique that results in separation between femur and tibia components. Morphological processing is applied to extract the femur region as the segmented outcome. Consequential of segmentation, a surfaces rendering method is applied for the 3D structure that automatically converts the model into standard tessellation language (STL) format for later CAD system and rapid prototyping preparation. Generated STL file is applied for creating a solid part and solid body. The Proper femoral component is designed using region growing technique then exported to FEM system to calculate the best metal thickness and angles, regarding the normal cartilage, to bear the maximum load with the lighter material. The process of ISF that involves machining and sheet forming parameters is using to manufacture customized medical metal femoral component but in low surface quality which increases the risk of ion release at *in vivo* condition. Therefore, during this technique, optimum parameters using Design of Experiment method are applied to modify and enhance the sheet stretching of final parts.
Results: Applying this integrated system demonstrates a cohesive user-friendly system for creation of patients specific implants while it showed a substantial reduction in implant production time compares to the current manufacturing method. In ISF process optimum parameters are used to increase the rate of stretching together with the best sheet thickness ∼2.5 mm based on validated sheet stretching simulation. The results of this study also show that the high surface quality for femoral component up to ∼Ra 2.527 is achievable using this newly developed method.
Conclusions: An integrated system that combines computational method, CAD, FEM and ISF procedure is developed that shows its potential for manufacturing of customized medical femoral component. Flexibility in size and shape make this system prominent. The best sheet thickness with respect to the cartilage thickness is calculated and obtained with the optimum process parameters for manufacturing section.
Acknowledgements: The authors are thankful to the Ministry of Higher Education, Malaysia for supporting this research via FRGS/1/2014/TK01/UTP/02/8 research grant.

AB1248-HPR THE ROLE OF PATIENT SUPPORT PROGRAMMES IN HEALTH LITERACY OF PATIENTS. RESULTS OF A 1.5-YEAR-LONG HUNGARIAN STUDY

A. Domján[1], Z. Szekanecz[1], J. Pilling[2], G. Purebl[2], Z. Szabo[1], P. Kakuk[3]. *[1]Department of Rheumatology, University of Debrecen Faculty of Medicine, Debrecen; [2]Institute of Behavioural Sciences, Semmelweis University, Budapest; [3]Institute of Behavioural Sciences, University of Debrecen, Faculty of Public Health, Debrecen, Hungary*

Background: Health literacy means our ability to find our way in health issues, to understand health information and how to utilize them, that is how we can understand and use health information. Unfortunately, every second person has serious deficit in this area in Hungary.
Objectives: We wished to determine the effectiveness of a specialized patient support program in Hungary.
Methods: The present study was conducted between August, 2015 and December, 2016 in Hungary. Altogether 24 health professionals in 15 investigational sites including rheumatology, gastroenterology and dermatology centres were involved. All participating health professionals was qualified and skilled in patient education. We tried to enrol mainly new patients with relatively little knowledge of their chronic illness. The participation was completely voluntary. The programme was based on 4 presentations on various but closely related topics, presented in small-group sessions by health professionals, and then discussed with the patients. The topics of the lectures were as follows: How to manage stress, associated with the disease? How to deal with the emotional burden of the disease? How to use social support when fighting a chronic disease? How should I tell? (physician-patient communication). The theoretical framework of the lectures was composed by 2 psychiatrists, proficient in the subject. The health professionals had also received extensive training before the programme. Altogether 1950 participants were present at least one of the lectures: Only those were carried forward and allowed to complete the questionnaire who participated in all 4 lectures of different topics. Thus, 480 patients completed the 8 questions of the questionnaire that evaluated the effectiveness of the programme.
Results: Among the 480 patients, who completed the study, 66% had joint and musculoskeletal complaints, 32% had inflammatory skin or gastrointestinal disease and 2% of them suffered from other chronic diseases. Altogether 24% was a member of a patient organization. Two-third of the patients felt better prepared for their consecutive doctor-patient or nurse-patient appointment after participating in the programme. In total, 49% of the responders found the doctor-patient communication lecture most helpful. In addition, 73% of them were able to successfully manage disease-related events and stress. Two-third of the patients wished to contact and/or keep in contact with a patient organization in order to take advantage of the opportunities of social support and 76% understood the place and role of patient organizations in the society. We wish to continue the programme in 2017 and we are aiming to target communication channels appropriate for the needs and opportunities of our age (e.g. Facebook).
Conclusions: The educational programme described above was successful among our patients. We think that appropriate health literacy can lead to the better understanding of the disease and maybe to the improvement of unfavourable health indicators.

AB1249-HPR THE EFFECT OF TASK-ORIENTED TRAINING ON FUNCTIONALITY, DEXTERITY AND ADL PERFORMANCE IN RHEUMATOID ARTHRITIS

Ö.F. Özçelep[1], E.I. Üstün[2], Z.C. Algun[3]. *[1]Prosthetics Orthotics Research Center, Istanbul Medipol University; [2]Physical Therapy and Rehabilitation, Bağcılar Education and Research Hospital; [3]Orthotics and Prosthetics, Istanbul Medipol University, Istanbul, Turkey*

Background: Rheumatoid arthritis is the most common and most serious of the inflammatory arthritides, and it dominates clinical rheumatological practice (1).This inflammation leads gradually to a destruction of bone and cartilage, responsible for loss of function (2).The main goals of treatment for RA are to prevent or control joint damage, prevent loss of function, and decrease pain (3).
Objectives: The purpose of the study is to investigate the effect of task oriented training on functionality, dexterity and ADL performance in rheumatoic hands.Also the other goal of this study is to bring a new perspective to RA rehabilitation.
Methods: Thirty seven women (16 patients in control group and 17 patients in study group) performed therapy programme. Control group received hand exercise therapy (MCP, DIP, PIP mobilization, range of motion exercise, isometric exercise) and study group received both hand exercise therapy and task oriented training (fork use, drinking water with a glass, face washing, sit up-stand up and t-shirt wearing) twice a week for 5 weeks. Every therapy sessions took 40–45 minutes for study group and 20–25 minutes for control group. According to the patient's condition, the rest interval was given and it was said that the exercises should not be done too fast. The results were evaluated before and after the therapy program with Jamar Hand Dynamometer, Nine Hole Peg Test, Health Assessment Questionaire and Duruöz Hand Index.
Results: Age distribution of participants was 49, 57 ($p>0,005$) and were found to be homogeneously dispersed ($p=0$, 15). Hand grip strength was not statistically

significant, although it increased in both groups except left hand grip strenght which was decreased after the program (control group: =0,552 (right hand), p=0, 666 (left hand)/study group: p=0,136 (rigt hand), p=0,723 (left hand)).The NHP showed a decrease in the duration of the test within both groups, but this decrease was not statistically significant (control group: p=0,113 (right hand), p=0,265 (left hand) /study group: p=0,215 (right hand), p=0,291 (left hand). The HAQ showed a statistically significant decrease in both groups (control group: p=0,001/study group: p=0,01).Although DHI decreased in both groups, the decrease in the study group was not statistically significant (control group: p=0,003/ study group: p=0,440).Treatment efficacy between groups after treatment was evaluated by Independent-t test and change in parameters other than HAQ and DHI was not statistically significant.

Conclusions: Hand exercise program and task oriented training are safe methods that can be used to increase the grip strengths of patients with rheumatoid arthritis, daily life activities and hand skills.The statistical significance of the results may be due to the low number of patients.We assume that this study can be done in a larger sample, the effect of task-oriented training on patients with rheumatoid arthritis will be better.

Building patient led organisations

PARE0001 GROWING STRONGER TOGETHER: IMPLEMENTING EULAR YOUNG PARE'S STRATEGY

J. Andersen[1,2,3], P. Balazova[1,4,5], P. Boyd[1,6], W. Olsder[1,7], S. Ostuzzi[1,8], T. Papastavrou[1,4,9], S.R. Stones[1,10,11], T. Wilhelmer[1,12], L. Van Nieuwkoop[7], N. Caeyers[4,13], F. Klett[14]. *[1]EULAR Young PARE, Zurich, Switzerland; [2]Lupus Europe, Essex, United Kingdom; [3]Sle/Lupus Ung Dk, Gigtforeningen, Gentofte, Denmark; [4]EULAR Standing Committee of PARE, Zurich, Switzerland; [5]Slovak League Against Rheumatism, Piestany, Slovakia; [6]Arthritis Ireland, Dublin, Ireland; [7]Youth-R-Well.com, Lisse, Netherlands; [8]ANMAR Young, Rome, Italy; [9]ELEANA Hellenic League Against Rheumatism, Athens, Greece; [10]Fibromyalgia Action UK, Paisley, Renfrewshire, United Kingdom; [11]University of Leeds, Leeds, United Kingdom; [12]Österreichische Rheumaliga, Salzburg, Austria; [13]ReumaNet Jong & Reuma, Bresserdijk, Belgium; [14]EULAR, Zurich, Switzerland*

Background: In a recent European youth survey, 53% reported that rheumatic and musculoskeletal diseases (RMDs) affected their ability to work, while 75% reported that RMDs interrupted their education. Therefore, in 2017 and 2018, while continuing to achieve the objectives reached in 2015 and 2016, EULAR Young PARE will focus on two key points from EULAR Young PARE's strategic objectives: work and education.
Objectives: In 2017, in line with EULAR's efforts to raise awareness of the needs of people with RMDs among employers and other stakeholders, the specific and still unmet needs of young people with RMDs will be highlighted, so that employers and other stakeholders will be more aware of the needs of young people with RMDs and young people will receive better support to find a suitable job. In 2018, education for young people with RMDs will be in focus, so that educational institutions across Europe will be more flexible and assistive in supporting high quality education for young people with RMDs.
Methods: In 2017, we will support EULAR's lobbying activities by raising awareness among employers and other stakeholders about the needs of young people with RMDs. We will also provide information to support young people in finding suitable jobs and to be aware of their rights in the workplace. Best practices concerning ergonomics, support programmes, career counselling and suitable jobs will be collected and shared. In 2018, we will support educational institutions across Europe to be more flexible and assistive in providing high quality education for young people with RMDs by offering training and support to national youth leaders.
Results: Thanks to the results achieved in 2015 and 2016, it is anticipated that structures will be in place to continuously raise awareness among employers, medical staff in schools, teachers and unions about the competencies and limitations of young people with RMDs. These activities enable EULAR Young PARE to expand and strengthen the active network of youth groups across Europe. Every PARE organisation will have a PARE youth liaison person, who will be encouraged and supported to take active roles in their national organisations and in the EULAR community.
Conclusions: The objectives reached by EULAR Young PARE in 2015 and 2016 are closely related to its future aims and achievements, allowing EULAR Young PARE to grow stronger and continue its work by the side of young people with RMDs, in order to improve their quality of life.

THURSDAY, 15 JUNE TO SATURDAY, 17 JUNE 2017

Arthritis research

PARE0002 CELEBRATING TEN YEARS OF SUCCESSFUL PATIENT INVOLVEMENT IN RESEARCH OF INFLAMMATORY CONDITIONS

A. Higginbottom[1], S. Blackburn[1], L. Campbell[1], C. Rhodes[1], R. Taylor[1], A. Machin[1], S. Hider[1,2], E. Roddy[1,2], C.A. Chew-Graham[1], K. Dziedzic[1]. *[1]Research Institute of Primary Care and Health Sciences, Keele University, Keele; [2]Haywood Academic Rheumatology Centre, Staffordshire and Stoke-on-Trent Partnership Trust, Stoke-On-Trent, United Kingdom*

Background: In 2016, the Research Institute (RI), Primary Care and Health Sciences, Keele University, UK, celebrated 10 years of Patient and Public Involvement and Engagement (PPIE) in research of musculoskeletal and other long term conditions. Our Research User Group (RUG) with over 90 members with a range of long-term conditions, actively work with research teams on studies. Many of whom have been involved in ten studies of different inflammatory conditions. We provide two case studies: 1) CONTACT: a trial comparing the effectiveness and side-effects of two commonly-used drugs (Naproxen and low-dose Colchicine) to treat acute gout in primary care; 2) A qualitative interview study with people with rheumatoid arthritis (RA) who had attended a nurse-led review clinic, which included identifying people at risk of anxiety and depression.
Objectives: To describe how PPIE helped shape the design and delivery of the CONTACT and qualitative interview studies.
Methods: 1) For the CONTACT trial, two RUG members with experience of gout joined the Trial Steering Committee. Another seven RUG members formed an advisory group to provide the patient perspective on trial procedures.
2) For the qualitative interview study, a group of eight people with RA from a local rheumatology centre (*Haywood User Group)* commented on the documents for the ethics application and met to discuss data analysis and dissemination.
Results: 1) In the CONTACT trial, RUG members made a difference by:
- Commenting on the trial design and acceptability of the drug intervention
- Helping to produce clear and user-friendly information sheets for participants in the trial.
- Provide practical advice regarding how participants were recruited

Future RUG involvement will include helping to interpret the trial findings planning further dissemination and discussing future research studies.
2) In the qualitative interview study, the PPIE group:
- Contributed to the development of readable patient questionnaires for use in the clinic
- Offered their perspectives on the interpretation of the qualitative data
- Helped develop a leaflet to inform patients about mood problems related to rheumatoid arthritis and where help could be sought
- Contributed to the establishment of an RA annual review clinic at the local hospital
- Advised on the dissemination of results to a lay audience
- Generated ideas for a study about the delivery of RA annual review clinics in primary care, supporting a related grant application

Conclusions: Both studies demonstrated the wide-ranging benefits of PPIE input throughout the research cycle of identification, designing, managing and disseminating research. The RI will continue to involve patients with long-term conditions in studies for the benefit of the wider patient community.
Acknowledgements: We thank all of our Research User Group members for their valuable time and contribution to the RI's research. CONTACT was funded by the NIHR School for Primary Care Research. The RA qualitative study was funded by the Scientific Foundation Board of the Royal College of General Practitioners and the Haywood Foundation. KD is part-funded by a NIHR Knowledge Mobilisation Research Fellowship (KMRF-2014–03–002). CCG is part funded by the NIHR Collaborations for Leadership in Applied Research and Care West Midlands.

THURSDAY, 15 JUNE TO SATURDAY, 17 JUNE 2017

Work and rehabilitation

PARE0003 ASSESSMENT OF PAIN AND IMPORTANCE OF EXERCISE IN HIP OSTEOARTHRITIS

A. Jurisic Skevin[1], V. Grbovic[2], A. Divjak[1], A. Tomic Lucic[1], M. Veselinovic[1], D. Pavlovic[3], J. Nurkovic[4]. *[1]Faculty of Medical Science; [2]Clinical center Kragujevac, Kragujevac; [3]Specialized Rehabilitation Hospital Bukovicka banja, Arandjelovac; [4]State University of Novi Pazar, Novi Pazar, Serbia*

Background: Osteoarthritis (OA) of the hip is a common condition which affects men and women of all ages. The cartilage becomes damaged. Stiffness and reduced range of movement are common. The pain experienced from OA of the hip may be felt in your lower back, buttocks and groin. You may also feel pain from your hip in your leg and down into your knee. This is called referred pain.The goals of OA treatment include alleviation of pain and improvement of functional status. Optimally, patients should receive a combination of nonpharmacologic and pharmacologic treatment. A physiatrist may help in formulating a nonpharmacologic management plan for the patient with OA.

Guidelines from Osteoarthritis Research Society International (OARSI) advise that nonpharmacologic treatment of hip and knee OA include the following: patient education; heat and cold; weight loss; exercise; physical therapy; occupational therapy; unloading in certain joints (eg, knee, hip).
Objectives: The aim of this study was to investigate the importance of exercise and TENS (Transcutaneous electrical nerve stimulation) therapy in patients with OA of the hip on the pain and functional status.
Methods: This was a prospective clinical study involving 20 patients with primary hip OA treated stationary at the Center for Physical Medicine and Rehabilitation during 2016. On receipt of all the respondents filled out the social survey, quantification of pain was conducted by visual analogue scale (VAS) and function was evaluated through measurement of the range of motionin hip joint. After that, they received physical therapy (exercise and TENS therapy) for 21 days. TENSwas applied once a day for 30 minnuteson both hip joints, with the frequency of 85 Hz and with short-term pulses (4 ms) (appliance TENS-2, Electronic Design Medical, Serbia). Exercisewas applied once a day for 30 minutes, according to individually customized protocol; active and active-assisted exercises were used to the point of pain for strengthening the muscles of the lower extremities and to increase range of motion in the hip joints.One month after the inspection we tested functional status and pain.
Results: There was 100% of women, mean age 64.15±4.06 years. The most represented were retirees, 60%, followed by workers and unemployed 10% and 30%.BMI was 27,3±4,22 kg/m^2. After a month there was a statistically significant reduction in pain measured by VAS (at the beginning it was 6,7; at the end 3,2; $p<0.001$). At the end of the study there was a statistically significant increasingrange of motion for active flexion ($p<0.05$) and active abduction ($p<0.0,5$), while there was no statistically significant increasing for active extension, adduction, internal and external rotation in the hip joint ($p>0.05$).
Conclusions: The ACR strongly recommends the following nonpharmacologic measures for patients with knee or hip OA: cardiovascular or resistance land-based exercise, aquatic exercise, weight loss, for overweight patients. TENS may be another treatment option for pain relief. Our study showed that exercise and TENS therapy led to a statistically significant reduction in pain as measured by VAS pain scale and improving range of motion in hip joint.

THURSDAY, 15 JUNE TO SATURDAY, 17 JUNE 2017

Patient information and education

PARE0004 PATIENT REPORTED LONG TERM EFFECTS OF SIX WEEK PROGRESSIVE RESISTANCE TRAINING PROGRAMME FOR RHEUMATOID ARTHRITIS

R. Tekkatte[1], A. Suarez[1], B. Berntzen[2], D. Collins[1], E. Price[1], L. Williamson[1]. *[1]Rheumatology; [2]Physiotherapy, Great Western Hospital NHS Foundation Trust, Swindon, United Kingdom*

Background: We introduced six week physiotherapy led progressive resistance training (PRT) programme for Rheumatoid arthritis (RA) patients to improve physical function and prevent the muscle loss (rheumatoid cachexia). Six week data showed improvement in body composition, physical function and fatigue scores[1]. There is little published data about the longer term benefits of short exercise interventions and therefore we wished to study longer term effects on exercise behaviour in our patient group.
Methods: We surveyed 79 RA patients who had completed the six weeks PRT programme between 2013 and 2016 using two methods: Anonymous postal questionnaire; Direct telephone questionnaire. Patients were asked the same following questions: 1. Describe the best you feel at present following the exercise programme? Same/ Better/ Worse. 2. Have you continued with progressive resistance exercises? Yes/ No. 3. Do you feel the programme was worthwhile? Yes/No. 4. Did you feel the programme was too long, just right or too short?
Results:

Patient	Continued PRT 75% (27/36) (Postal)	Not continued PRT 25% (9/36) (Postal)	Continued PRT 51% (22/43) (Telephone)	Not continued PRT 49% (21/43) (Telephone)
Better	81% (22/27) (p=0.006)	33% (3/9)	77% (17/22) (p=0.009)	38% (8/21)
Same	15% (4/27)	56% (5/9)	18% (4/22)	19% (4/21)
Worse	4% (1/27)	11% (1/9)	5% (1/22)	43% (9/21)

Postal questionnaire: 45% (36/79) patients returned the postal questionnaire. Time from PRT programme completion to postal questionnaire was: range (mean) 12–36 (26) months. 69% (25/36) still felt better; 25% (9/36) felt the same; 3% (1/36) worse since the programme. 91% (33/36) felt the programme was worthwhile. 75% (27/36) continued PRT exercises. 81% (22/27) of these still felt better, compared with 33% (3/9) who have not continued PRT (p=0.006). The duration of the programme was just right for 69% (25/36) and too short for 30% (11/36).
Telephone questionnaire: 54% (43/79) patients were contactable by telephone. Time from PRT programme completion to telephone questionnaire was: range (mean) 14–38 (26) months. 58% (25/43) still felt better; 18% (8/43) felt the same; 23% (10/43) worse since the programme. 95% (41/43) felt the programme was worthwhile. 51% (22/43) continued PRT exercises. 77% (17/22) still felt better, compared with 38% (8/21) who have not continued PRT. (p=0.009). 49% (21/43) had not continued PRT exercises, of whom 43% feel worse at present. The duration of the programme was just right for 47% (20/43) and too short for 53% (23/43).
Conclusions: Over 90% of patients who responded found the six week PRT programme worthwhile. More than half (51–75%) of the patients continued a PRT exercise programme. Patients who continued exercises felt better compared with those who did not continue exercises.

PARE0005 EDUCATIONAL PROGRAM FOR OLDER ADULTS WITH KNEE OSTEOARTHRITIS

M.R. Espanha[1], P.P. Marconcin[1,2], P.L. Campos[2], F.G. Yázigi[3]. *[1]Portuguese League Against Rheumatic Diseases; [2]Department of Sports and Health; [3]Department of Sports & Health, Faculty of Human Kinetics, University of Lisbon, Lisboa, Portugal*

Background: Osteoarthritis is the commonest cause of disability at older ages and it is a huge burden on primary care (Peat, McCarney, & Croft, 2001). The knee joint is one of the most affected in elderly, influencing directly physical function and affecting physiological and social parameters. Therefore, it is imperative to development strategies that help individuals to change the way the disease affect their lives. International recommendations reinforce educational and exercise programs as the core of non-pharmacological approaches to enhance physical functional and relieve pain and others osteoarthritis symptoms.
Objectives: The purpose was to assess the effectiveness of three months educational program for older adults with knee osteoarthritis (KOA).
Methods: Participants recruitment was done in the community using various marketing strategies. Forty individuals with 60 years or more, bilateral or unilateral KOA diagnosed according to clinical and radiological criteria of the ACR (1) and independently mobile and literate participated in the program. Educational sessions regarding exercise and joint protection strategies were offered. Telephone calls were done 15 days after each educational session. Patients received a book (2), with a core exercise section. Patients in the first attendance session were taught to do registration in an exercise training diary. Self-reported measures were pain, other symptoms, activities of daily living (ADL), and quality of life assessed by Knee Injury and Osteoarthritis Outcome Score (KOOS) questionnaire (3), Patient Global Impression of Change Scale (PGICS).
Results: Final sample included 32 adults (age: 67.8±5.3 years; bilateral KOA: 93.8%; female, 59.4%; BMI: 30.1±5.3 kg/m^2). Eight participants did not complete the program (3 due to health problems and 5 for personal reasons). KOOS pain improved 10% (p=.042), and other symptoms 8%. Improvement in KOOS ADL (-8.7±13.6) and quality of life (-8.2±18.0) were also observed. 47% of the participants reported significant changes (scores 5–7) after intervention and a decrease in medication use of 31.3%.
Conclusions: The educational program can be an effective and suitable way for osteoarthritis management and to improve pain and health-related quality of life, leading individuals with KOA to better control their pathology and consequently living better.

PARE0006 PATIENT INVOLVEMENT IN BASIC RESEARCH: A PILOT STUDY

Y. Neijland[1], C. van den Ende[1], F. van den Hoogen[1], P. van der Kraan[2], F. van de Loo[2], M. Lieon[3]. *[1]Sint Maartenskliniek; [2]Experimental Rheumatology, Radboud University Medical Centre; [3]Patient Representative, Sint Maartenskliniek, Nijmegen, Netherlands*

Background: Although the potential value of patient involvement in clinical research has been recognized [1], involvement of patient representatives (PRs) in non-clinical research is uncommon.

Objectives:
- Mapping beliefs of researchers and PRs about the potential value of patient involvement in basic research.
- To document experiences of both patient representatives and researchers of a pilot project of PRs participating in basic research.

Methods: The method of participatory action research has been used. This is a research approach that emphasizes both participation and action [2]. In this case two working groups were involved. The coordinator participated in meetings of the working groups, made notes during these meetings about the nature and degree of participation, evaluated the meetings with the participants and kept a diary. At the start and at the end of the pilot 6 researchers of the working groups were interviewed by the coordinator. The findings of the interviews were categorized and summarized. During 6 months, 5 PRs were invited to attend once a month, in one of the working group meetings. In the first meeting expectations of both researchers and PRs were exchanged. In the following meetings one researcher presented a lay version summary of his/her work. There was room for PRs to ask questions.

Results: Prior to the pilot, some researchers had doubts about the added value of PRs, others were more positive and even curious. All PRs were open minded about the pilot, although none of them had experience with involvement in basic research.

At the end of the pilot, researchers expressed positive statements, such as: "(very) nice, good initiative and interesting discussions." Positive experiences included: exercise in explaining their work to lay persons; stimulation in developing a more holistic (helicopter) view of their research, and getting a better insight in problems in daily life that patients encounter.

The PRs experienced the atmosphere during meetings as open and pleasant; they felt that the degree of participation was limited, but worthwhile.

The coordinator observed that interaction between the researchers and PRs mainly consisted of asking questions for clarification. Besides, the coordinator observed after presentations exchanges between PRs and about research-related issues such as the availability of human tissues for research and conversations about personal experiences.

Critical comments were made about the difficulty in understanding the complex matter for PRs and the chosen method (researcher presents, PRs listened) that does not encourage interaction.

Conclusions: There is a potential value of patient involvement in basic research. A first result is that junior researchers develop a more holistic view of their research subject.

An open atmosphere and low expectations may contribute to success. Continuation of this pilot with modifications, including more research groups and PRs, are needed to finds ways to increase patient involvement in basic research.

PARE0007 HOPES AND FEARS OF PATIENTS WITH AXIAL SPONDYLOARTHRITIS IN SPAIN. THE VALUE OF PATIENT OPINION: RESULTS FROM THE SPANISH ATLAS

M. Garrido-Cumbrera[1,2], P. Plazuelo-Ramos[2], A. Costa[3], O. Brace[1], J. Chacón-García[1], D. Gálvez-Ruiz[1]. *[1]Universidad de Sevilla, Seville; [2]CEADE, Madrid; [3]Novartis, Seville, Spain*

Background: Not much attention has been paid to listening to the opinions of patients in most scientific studies on Spondyloarthritis, despite their opinions playing an increasingly important role in decision-making alongside clinical and public health criteria.

Objectives: To assess the opinions of patients with Axial Spondyloarthritis (ax-SpA) using qualitative information.

Methods: A sample of 680 patients diagnosed with ax-SpA was interviewed during 2016 as part of the Spanish Atlas, which aims to promote early referral and improve healthcare and the use of effective treatments in patients with ax-SpA. The Atlas is a CEADE initiative (Spanish Coordinator of Patients with ax-SpA in Spain) developed by the University of Seville and Max Weber Institute in collaboration with GRESSER (Spanish Rheumatology Society spondyloarthritis study group). Responses to qualitative items about patients' hopes and fears for their disease and their personal aims regarding their treatment were analysed.

Results: 53% were females, mean age 46 years and 77.1% were HLA-B27+. The five main hopes of patients are: stopping the disease, dream of a cure, elimination of pain, improve their quality of life and live without limitations. Additionally, patients has expectations on the medical research outcomes. Thus, 81% of patients hope that the research will make possible to find the cause and a cure for ax-SpA, developing more efficient biologic therapies (11%), and finding new techniques or medication (8%).

The following stand out among drug treatment-related concerns: having more effective treatments (32%), sustaining the results of biologic therapies (29%), being able to start on biologics (8%), the public health system funding non-drug treatments for AS (8%), eliminating secondary effects (15%), reducing prices (4%), and correct use (4%).

With respect to their fears, patients stated that their main concern was mobility loss (31%), followed by loss of independence (23%), disability (22%), stiffness (12%), structural damage (3%), organ damage (3%), other illnesses and diseases related (3%), physical decline (3%), and sight loss (1%).

Patients who expressed fear regarding their disease listed their greatest concern was that they would not overcome or tolerate pain (56%), followed by the fear that the disease would develop (32%), along with apprehension about flare-ups (7%), and tiredness (5%).

With respect to patients' personal objectives in terms of their treatments, they highlighted the wish that their treatment would, first, help them to reduce and eliminate pain, increasing their in mobility, improved quality of life, the avoidance of structural damage and the disease eventually being cured.

Conclusions: Analysis of patient opinion using qualitative information has enabled the identification of important concerns for patients such as discovering the cause of the disease, reducing pain and structural damage, loss of self-sufficiency and disability.

Acknowledgements: This project has been supported by Novartis.

THURSDAY, 15 JUNE TO SATURDAY, 17 JUNE 2017

Best practice campaigning

PARE0008 TRANSITION: PARTICULARLY DIFFICULT TIME FOR YOUNG PEOPLE WITH AR

U.G. Viora[1], E. Fusaro[2], S. Martino[3], D. Montin[3]. *[1]Anmar Italia; [2]SC Reumatologia; [3]SS Immunoreumatologia pediatrica, Città della salute e della scienza, Torino, Italy*

Background: Transition is a multifaceted process involving medical, psychosocial, educational needs of the teenager who must move from a pediatric care to adult care system.

The pediatric paradigm focuses on the family, it focuses on aspects of growth and development, often neglecting, to acknowledge the increasing independence and autonomy of the patient as an individual.

The culture of adult medicine implies to have as a partner a patient independent and autonomous in the management of the disease, including aspects of playing, ignoring the issues related to the growth, development and relations with the family.

Objectives: to drive the patient along the transition, getting him finding the new treating as a continued assistance, more mature and personalized in sharing issues related to the disease; to create a best practice of transition service.

Methods: promoted by AMaR Piemonte - regional expression of ANMAR - and thanks to the availability and sensitivity of the doctors of the Pediatric Rheumatology Service (responsible Prof. Silvana Martino) and the UOA Rheumatology (director dr. Enrico Fusaro), located in two different buildings of the same "Città della Salute e della Scienza di Torino" hospital, it was possible to organize a transition pathway for teenagers since eighteen, structured as follows:
- *first telephone contact between Pediatrician Rheumatologist and Rheumatologist*
- *sharing of clinical and personal information about the young patient*
- *introduction to the new care giver:* during the routine consultation Pediatrician Rheumatologist presents his colleague, anticipating the different types of examinations and departmental activities and highlighting the peculiarities and sensitivity of his colleague
- *meeting with parents:* on the fringes the two specialists meet parents, preparing them for their future role and announcing that in the next visit they will be excluded
- *transition examination:* directly scheduled, it is a joint examination by the two rheumatologists to the young patient, who is directly involved discussing his health state and the decisions to be taken to continue therapies or monitoring the disease (if in remission). A second one may be scheduled if the young patient shows severe psychological problems.
  A collegial meeting between patient, rheumatologists and physiatrist/rehabilitator will be programmed if a special rehabilitation is needed
- *taking care:* the new rheumatologist takes care of the young patient

All the pathway takes end in a period of time not exceeding one month, with a maximum of three consultations.

Results: 52 patients (79% female, 21% male) taken in care by "adult" rheumatology since 2012 to 2016. No patient reports he lived the transition as a trauma and 10%, even saying to have found in the new rheumatologist a sure and affordable referral, stay in contact with the pediatric rheumatologist "because of emotional issues". 58% remains under treatment with DMARDs and biologics; in 32% of patients an extra-articular manifestation occurs even in the absence of clinical parameters indicative of medium-high disease activity. The remaining 10%, in remission, continues the control.

Conclusions: Transition is an educational and therapeutic process, not an event; it requires collaboration between the teenager, family and caregivers.

THURSDAY, 15 JUNE TO SATURDAY, 17 JUNE 2017

Psychosocial support

PARE0009 A TAXONOMY OF DISEASE EXPERIENCES OF WOMEN WITH SJÖGREN'S SYNDROME FROM THE PERSPECTIVE OF THE PATIENT

M.Y. Visser-Noordegraaf[1], V. Hiensch[2], G. Rojas-Alcayaga[3], R. Geenen[2]. *[1]NVSP, National Association Sjögren Patiënts, Maarssen; [2]Psychology, Utrecht University, Utrecht, Netherlands; [3]Faculty of Dentistry, Universidad de Chile, Santiago, Chile*

Background: In earlier studies of experiences of patients with Sjögren's Syndrome (SS), professionals interpreted the data and drew conclusions and implications. In the current study, patients had a major share in the interpretation and structuring of experiences, and a patient research partner was part of the research group in all phases of the study: planning, collecting data, organizing, analyzing, and reporting.
Objectives: The aim of this study was to examine the full spectrum of life experiences of women with SS in an integrated, hierarchical model, and to examine the degree to which the research participants experienced the sorted experiences themselves.
Methods: Patients structured and interpreted the data using a concept mapping technique. In a card-sorting task, 52 patients with SS from the Netherlands grouped 75 experiences in piles. These experiences came from previous in-depth interviews with Chilean patients [1]. Hierarchical cluster analysis yielded an integrated, hierarchical model of these sortings. The 52 patients indicated on a 4-point Likert scale whether they had had these experiences themselves: agree, agree a little, disagree a little, disagree.
Results: Hierarchical cluster analyses showed a main 6-category clustering of experiences with primary symptoms, emotional processing, social interaction, self-management, ignorance, and physicians. Four of these categories showed underlying clusters of experiences (see Figure). Patients generally agreed to have common experiences of "primary symptoms", "role functioning barriers", and "diagnosis" and they commonly disagreed with the "psychologizing" symptoms, while they differed in the degree to which they had individually experienced the other experiences.

Conclusions: Life experiences of women with SS were summarized in an integrated, hierarchical model consisting of 14 clusters in 6 overarching categories. The results may be colored by the cultural background of the participants. This year this concept mapping study will be extended to patients from Chile, which will increase the generalizability of the findings and allow cross-cultural comparison. The final hierarchical overview with life experiences from the patient's view can be used to improve screening in clinical consults, develop a questionnaire, give direction to future research, and enhance education and self-management support [cf. 2]. The method gives ample room to really incorporate the patient perspective in research.

Arthritis research

PARE0010 SIGNIFICANCE OF FOOT PROBLEMS FOR PATIENTS WITH RHEUMATOID ARTHRITIS: A PATIENT-LED QUALITATIVE STUDY

S. de Souza, H. Lempp. *Academic Rheumatology, King's College London, London, United Kingdom*

Background: Patients with rheumatoid arthritis (RA) commonly report problems with their feet.[1] It is known that foot joint involvement begins early in the course of RA and even patients on biologic therapy and/or with low disease activity can still experience high levels of foot pain.[1–3] Current UK guidance states that "All people with RA and foot problems should have access to a podiatrist for assessment and periodic review of their foot health needs".[4]
Objectives: To understand how foot health problems affect patients with RA.
Methods: Adult patients, with a diagnosis of rheumatoid arthritis and ability to converse in English, were recruited by clinicians based at a London hospital rheumatology outpatient clinic to participate in two focus groups on foot health. These were conducted by the lead patient researcher and comprised 8 females and 1 male of diverse ethnicities, aged 27–68 years old with 4–46 years disease duration. The focus groups were audio-recorded and transcribed verbatim. Transcripts were verified for authenticity by a random sample of 4 participants, and were systematically coded with the assistance of qualitative data analysis computer software. Themes were generated and cross-checked by the co-researcher to negate any potential bias by the lead patient researcher.
Results: Four interlinked themes were identified: 1) dependence on feet, e.g. needed for standing and walking; 2) physical impact e.g. pain, swelling and deformities; 3) social impact e.g. hard to keep appointments and participate in leisure activities; 4) psychological impact e.g. low self-esteem, worry and using humour to cope. The sole male participant was unaffected by theme 4. One patient in the group had not experienced foot problems since diagnosis. No differences were identified across age, ethnicity or disease duration.
Conclusions: Foot problems can significantly lower quality of life for patients with RA. It is therefore essential that foot health is adequately addressed during rheumatology outpatient consultations with onward referral to podiatry services as necessary.

Best practice campaigning

PARE0011 ASK THE USERS - ESTABLISHING A DIGITAL USER PANEL

C.R. Ziegler[1,2]. *[1]Danish Rheumatism Association, Gentofte, Denmark; [2]Policy and Research, Danish Rheumatism Association, Gentofte, Denmark*

Background: A high level of user involvement is one way of assuring campaigns to be relevant to people with RMD's. This is true for all projects within the PARE organisations. The Danish Rheumatism Association would like to strengthen our political campaigning and we found this goal could be reached by establishing a representative digital user panel. A representative digital user panel would give us quicker, more relevant and high quality information about the opinion of the users and their experience within many different aspects of living with RMD's in Denmark.
Objectives: The Danish Rheumatism Association wanted to strengthen the impact of our political campaigning. We wanted to establish a representative user panel consisting of 1500 Danes with RMD's. A digital user panel was found to be a quick and efficient tool to secure real life experiences and knowledge from the users. The user panel would make us interact with our users in even better ways and through that we were able to strengthen our political campaigning.
Methods: In 2016 we tried to recruit participants among our members to assure that the panel was representative, but that was more difficult than we expected and we had to use other channels to recruit too. We wanted to ask the user panel about different themes 6–8 times each year. We investigated the collected data

and used them directly in our political campaigning and communicative work – without the time waster of making fancy reports.
Results: It turned out to be more difficult to establish a representative user panel than we thought. The barriers were various, but we succeeded in the end. The knowledge gained from the user panel has focused and strengthened our political work. This obtained influence would have been very difficult or even impossible to achieve without the experiences of the users. In our presentation we will go into details about the barriers of the establishing phase, share how we use the panel, give examples of how the answers are an added value and show how it helped us gain more political impact.
Conclusions: After overcoming several barriers it will possible to establish a digital user panel which can help organisations to improve their political campaigning.

THURSDAY, 15 JUNE TO SATURDAY, 17 JUNE 2017

Patient information and education

PARE0012 EDUCATING YOUNG CHILDREN, PARENTS AND DOCTORS THROUGH THE MEDIUM OF AN ILLUSTRATED CHILDREN'S BOOK

T. Egert[1], Y. Egert[2], R. Vitman[1], W. Costello[3]. *[1]4682, Efrat, Israel; [2]Netzach Yerushalayim 8, 4682, Efrat, Israel; [3]4682, Dublin, Ireland*

Background: Chronic illness in a child is a complex reality for all involved. *The child* often feels confused and afraid. He doesn't understand why he is sick and in pain, he worries about the doctor and hospital visits, as well as the medications and shots to which he is subjected. *Parents* are unsure how the illness will affect their child, and how to best prepare him for future challenges. Both parent and child are not always sure how to communicate to the *Doctor* their needs and concerns. Communication, however, between parent, doctor, child and health professional is critical for the effective treatment of the disease.
Objectives: This book attempts to open lines of communication between parent and child, to educate, give coping tools, and a voice to the young patient in a fun and optimistic manner. The book targets many of the children's challenges through identifying with Kipo, the young monkey who also has JIA.
The objectives: 1. To give the child strength and tools to deal with his illness. 2. Improve compliance through a better understanding of treatment.
Methods: A list of challenges young children with JIA face was compiled through meetings with parents, doctors and children. Next, a list of coping strategies was produced based on discussions with parents and health professionals. The story addresses the challenges and methods of dealing with them in a fun and optimistic manner through young Kipo's routine. Included are also messages addressed to the parent and doctor. To keep the child an active part of the story, thus allowing him to voice his concerns and discover coping skills, the story line requires active participation through "reading the pictures" which accompany the text. (The book includes a "how to read" guide). The back page includes a brief description of the illness, as well as other useful web addresses: parents associations, PRINTO, etc'.
Results: Working jointly with the illustrator an illustrated children's book in 3 different languages (Hebrew, English and Arabic) was published. The book addresses the challenges and difficulties of a young child with JIA through the story of Kipo the monkey who is also ill. Included are a visit to the doctor, getting an injection, going to the physiotherapist, etc. The book is distributed free of charge though the paediatric rheumatologists to the families, and is received very enthusiastically by parents, children and doctors. The children read and reread the book sharing it with family, friends and kindergarten classrooms. They use the terminology introduced in the book to describe their own physical and emotional feelings, and adopt coping strategies used by Kipo.
Conclusions: The success of the book motivated us to allow for a more international distribution. The illustrations and the text are available allowing it to be used by any national group.
Acknowledgements: Inbar, Mifrakim Zeerim, ENCA, Dror Adam (illustrator), anonymous unaffiliated donors, doctors, parents and translators.

DOI: 10.1136/annrheumdis-2017-eular.1687

PARE0013 BEHIND THE SMILE - RA AWARENESS VIDEOS - RAISING AWARENESS OF THE HIDDEN IMPACT OF RHEUMATOID ARTHRITIS

C.B. Jacklin, D. Saunders. *External Affairs, National Rheumatoid Arthritis Society, Maidenhead, United Kingdom*

Background: NRAS was approached by Lilly Pharmaceuticals to contribute to the design and production of a series of videos to raise awareness of the hidden impact of rheumatoid arthritis. As this clearly met the charity's own objectives of raising awareness to a variety of audiences NRAS gladly collaborated on this project.
Objectives: The key aim of developing these resources to be utilised in European countries was to raise awareness of the impact of RA on daily life to 1) the general public, 2) clinicians, 3) payers, 4) industry and 5) people living with RA and their families. The challenge was to capture, in a two minute video, key messages that would resonate with all these stakeholders.
Methods: NRAS worked with a PR agency to develop an appropriate script for the main Behind the Smile resource. The main character, Jane, who lives with RA, was to be in her mid 30s – to represent that RA is not associated with ageing; a school teacher – to represent that working is more than just a job for her and that she is a valued contributor to society; and a daughter, wife and mother – to represent how many other people depend on her and that she has commitments to.
We filmed with the support of Donna Saunders, NRAS Member & Volunteer, on hand to comment and ensure authenticity of how the actress moved and dealt with every day activities. The final scene shows the character of Jane attending her clinic appointment with her rheumatologist and even then putting on a brave face and hiding behind the smile of the typical response "I'm fine".
In addition, Donna who lives with RA, was filmed giving her personal comments on the awareness film and insights into her personal struggles. Finally, Prof. Iain McInnes, was filmed giving the clinicians perspective and offering advice as to how health care professionals need to keep at the forefront of their minds that patients are people and to be truly effective as physicians they should always make the time to open the dialogue on how the individual is truly "feeling"
Results: The films were released on World Arthritis Day 2016 via Lilly and NRAS social media channels in the UK. To date the "Jane" clip has been viewed in access of 200,000 times. The feedback from patients has been overwhelmingly that it has truly captured their "story". Physicians and industry staff have been left speechless and moved by the emotive film. NRAS and Lilly continue to utilise the films at health care professional training, staff and patient events.
Conclusions: Plans for 2017 is to develop more similar awareness raising videos as it is evident that using social media with video has impact and reach.
Acknowledgements: Acknowledge the support of Lilly Pharmaceuticals for the funding to develop these resources. The invaluable support of Prof.Iain McInnes and patient Donna Saunders
Disclosure of Interest: C. Jacklin Grant/research support from: Lilly Pharmaceuticals, D. Saunders: None declared

PARE0014 EXPLORING THE ADDED VALUE OF A BOOSTER SESSION AFTER COMPLETING THE DUTCH SELF-MANAGEMENT TRAINING "CHALLENGING ARTHRITIS"

M. Vos[1], R. Van den Brink[2], S. de Jong[2], J. Ammerlaan[3]. *[1]Expert Patient/Psychologist, Purmerend; [2]Dutch Arthritis Foundation, Amsterdam; [3]Rheumatology & Clinical Immunology, University Medical Centre Utrecht, Utrecht, Netherlands*

Background: In the Netherlands, the peer-guided self-management training "Challenging Arthritis" exists for over 15 years and is being organized by the Dutch Arthritis Foundation and the University Medical Center Utrecht. The training is based on the "Arthritis Self-Management Program"[1] but has recently gone through several updates, improvements and extensions[2]. The goal of the training is to improve self-management skills of patients and thereby improving their physical and emotional health and quality of life. Evaluations show that participants highly appreciate the training, but some of them have suggested that they would like to have an extra moment of training, (i.e., a booster session) after the ending of the regular program. Research shows that self-management programs are effective but mostly in the short term[3]. The effects of "Challenging Arthritis" may be enhanced and prolonged by organizing booster sessions.
Objectives: Aim of this research is to make recommendations about organizing booster sessions based on 1) a literature search and 2) a needs assessment among former participants and peer trainers.
Methods: A literature search was performed in databases like Google Scholar, PubMed and Science Direct, focusing on articles about the use of boosters in self-management interventions, limited to the years 2000–2016. Next to that, a needs assessment was conducted among participants and trainers on needs and preferences, using two separate online surveys. The survey for the participants, who followed a live training between 2012 and 2015, included items on the need for a booster and on preferences regarding its form, content and frequency. The survey for peer trainers addressed the perceived usefulness and the trainers' willingness to provide booster sessions. The resulting data were analyzed using SPSS and thematic analysis.
Results: The literature search yielded 27 articles describing health interventions with aspects of self-management, including one or more booster sessions. From a theoretical perspective, boosters are a way to maintain new behavior over an extended period of time. As of yet, there is little evidence that the use of boosters lead to better outcomes in terms of health or health behavior, but it has been suggested that tailoring may lead to better results[4,5]. Regarding the needs assessment, 124 participants and 34 trainers completed the survey. Results showed that almost half of the participants (47,5%) expressed a need for a booster, while the other half (52,5%) expressed little or no need. Participants who prefer a booster want to share experiences, learn how to stay active with self-management and how to cope with setbacks. Trainers think boosters are very useful for the participants to stay active with self-management and maintain behavior and they are unanimously willing to provide booster sessions.
Conclusions: Boosters may contribute to the maintenance of newly acquired health behavior, although more research is needed on this subject. A substantial

part of the participants expresses the need for a booster and trainers are highly motivated to provide it. Therefore, we think it's worthwhile to start experimenting with organizing booster sessions on a small scale and, depending on the outcomes, consider further implementation.

PARE0015 THE IMPORTANCE OF FACE-TO-FACE NETWORKS: FINDINGS FROM THE 2ND EULAR YOUNG PARE CONFERENCE, "CHANGE THE FUTURE"

J. Andersen[1,2], P. Balazova[3,4], W. Olsder[5], S. Ostuzzi[6], D. Papastavrou[4,7], S. Stones[8,9], T. Wilhelmer[10], P. Boyd[11] on behalf of EULAR Young PARE. *[1]5sle/Lupus Ung Dk, Gigtforeningen, Gentofte, Denmark, Gentofte, Denmark; [2]Lupus Europe, Essex, United Kingdom, Essex, United Kingdom; [3]Slovak League Against Rheumatism, Piestany, Slovakia, Piestany, Slovakia; [4]EULAR Standing Committee of PARE, Zurich, Switzerland, Zurich, Switzerland; [5]Youth-R-Well.com, Lisse, The Netherlands, Lisse, Netherlands; [6]ANMAR Young, Rome, Italy, Rome, Italy; [7]ELEANA Hellenic League Against Rheumatism, Athens, Greece, Athens, Greece; [8]School of Healthcare, University of Leeds, Leeds, United Kingdom, Leeds; [9]Fibromyalgia Action UK, Paisley, Renfrewshire, United Kingdom, Paisley, United Kingdom; [10]Österreichische Rheumaliga, Salzburg, Austria, Salzburg, Austria; [11]Arthritis Ireland, Dublin, Ireland, Dublin, Ireland*

Background: EULAR Young PARE's strategy for 2020 is to establish and strengthen groups for young people with rheumatic and musculoskeletal diseases (RMDs) across Europe, by developing a collaborative network. We aim to empower youth leaders to ensure the voice of young people with RMDs is heard. To facilitate this, the 2nd EULAR Young PARE Conference was held in Retie, Belgium in October 2016.

Objectives: To empower and educate EULAR Young PARE youth liaisons, focusing on developing academic and interpersonal skills to best support young people across Europe living with RMDs. This was achieved through a series of practical, skills-based workshops and plenary sessions.

Methods: The EULAR Young PARE working group reflected on the conference during a debrief meeting. A post-conference evaluation was completed by liaisons. A five-point Likert scale (1= very bad, 5= very good) was used alongside open questions. In addition, there was an informal meeting to generate discussions and receive input from participants regarding the future direction and focus of EULAR Young PARE in 2017 and 2018.

Results: The conference was attended by 22 youth liaisons from 20 organisations. The programme was well received with the face-to-face interactions favoured to establish and grow collaborative networks. Through a series of digital poster presentations, each liaison had the opportunity to share recent work in their national organisations. This session was evaluated positively and encouraged liaisons to identify opportunities for collaboration and new national activities, using the VKC as a platform for the sharing of best practices. Workshops were delivered in collaboration with EMEUNET and a EULAR member organisation representative and we piloted a series of six walk-in workshops. While these workshops were evaluated positively, a lack of structure and the need for time constraints was a consistent finding.

Conclusions: The "Change the Future" conference was a successful meeting of youth liaisons from across Europe, who were highly satisfied with the programme and mechanism of delivery. Meeting in person facilitated the growth and continued involvement within the EULAR Young PARE network. The activities of EULAR, and specifically the Standing Committee of PARE, were shared with liaisons, encouraging liaisons to become involved in a wider number of EULAR activities. Theoretical and practical skills were developed, while best practices and experiences were shared and highly valued. Furthermore, in future conferences, bitesize workshops will replace walk-in workshops for structure and clarity. Despite living in a digitally connected world, face-to-face interactions cannot be replaced. Learning can be enhanced and actions implemented when motivated individuals are physically united, demonstrating the need for the use of multiple meeting methods to drive innovation. Following the conference, everyone felt inspired, empowered and motivated to implement concrete and tangible steps to inform ongoing and future work. Together, we can change the future for young people living with RMDs.

PARE0016 KEEP CALM AND TELL ME YOUR STORY!: A NARRATIVE MEDICINE PILOT PROJECT FOR ITALIAN YOUNG PEOPLE LIVING WITH RHEUMATIC AND MUSCULOSKELETAL DISEASES

U.G. Viora[1], S. Ostuzzi[2,3] on behalf of ANMAR Italia - ANMAR Young. *[1]Anmar Italia, Torino; [2]Anmar Young, Anmar Italia, Rome, Italy; [3]Eular Young Pare, Zurich, Switzerland*

Background: The 7th point of EULAR Young PARE's Youth Strategy states that "By 2020, every European country has an active national youth group for young people with rheumatic and musculoskeletal diseases (RMDs)". On this basis, ANMAR – Italian national association for people with RMDs – has engaged in the creation of a youth group dedicated to Italian young people (aged 18–35) living with RMDs: ANMAR Young was born in 2015, through EULAR's Knowledge Transfer Programme. During its first year of activities, ANMAR Young has launched the pilot project of a narrative medicine campaign called *Keep Calm and Tell Me Your Story!*

Objectives: *Keep Calm and Tell Me Your Story!* was designed to make sure that the voice of young Italian people living with RMDs is heard, spread, and listened to. In its pilot phase, the project aimed to consult, engage, involve young rheumatic patients while building an Italian network. A major pilot phase's objective was, as well, the launch of a booklet presenting the collected stories on World Arthritis Day 2016.

Methods: The ANMAR Young task force has drafted the four different writing traces to compose the campaign, investigating some crucial issues, such as: the impact of RMDs on young people's personal life, working life and education; the experience of transitioning from pediatric to adult rheumatology care services; young rheumatic patients' unmet needs and priorities. The criteria for inclusion of participants were deliberately simple: every Italian person living with any RMDs and aged from 18 to 35 could take part in the campaign. Texts have been collected anonymously exclusively through an online form, promoted and disseminated mostly through social media. The pilot project campaign has lasted one month, from the end of July 2016 until the end of August 2016.

Results: From the end of July 2016 to the end of August 2016 21 stories have been submitted by 20 female respondents and 1 male respondent coming from 11 different Italian regions, suffering from different RMDs (among which the condition reported more often is Juvenile Idiopathic Arthritis). The collection has become the subject of a booklet, published in an edition of about 5,000 copies and officially launched in October 2016 in Rome, on World Arthritis Day. The campaign spread online, allowing ANMAR Young to gather different experiences, expand its network, contribute in the process of empowerment and engagement of Italian young rheumatic patients.

Conclusions: The campaign *Keep Calm and Tell Me Your Story!* has proved to be a valuable, peer-to-peer, economically sustainable, easily manageable and repeatable (also abroad) engaging tool for raising awareness about the impact of RMDs on the quality of life of young people. We intend to further develop this narrative medicine experience by keeping collecting new stories, by sharing them weekly through social media, by promoting our printed booklet. We intend to further analyze in detail the collected texts, in order to read them not only as personal experiences but also as a qualitative mapping of Italian young people with RMDs' unmet needs and priorities.

PARE0017 EMPOWERING PATIENTS WITH OSTEOARTHRITIS WITH NON-PHARMACOLOGICAL MEASURES

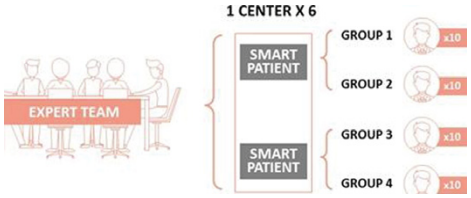
J. Vergés[1], J. Monfort[2], M. Bibas[1], M.T. Vergés[1]. *[1]Osteoarthritis Foundation International; [2]Hospital del Mar, Barcelona, Spain*

Background: Osteoarthritis (OA) and other joint pains are generally seen as ailments that affect people with age. With the increase in life expectancy over recent decades, the prevalence of people with OA is drastically growing. Estimates suggest that there are 242M people with OA in the world[1]; 30M live in Europe[2]. The most commonly affected joint at the present time is the knee, followed by hips and shoulders[3].

Objectives: To run an educational program that will provide elderly people with tools to tackle their problems of joints so that they can improve their quality of life by adopting non-pharmacological measures. A well-informed patient knows how to address their disease. Thus, they can improve their quality of life.

Methods: The method is based on the capacity of a motivated patient to positively influence others also worried by their health situation by sharing their experiences and awareness of the disease.

Stage I. Preparatory actions:



1. Elaboration of contents: An expert team (psychologist, nurse, rheumatologist, family doctor, physiotherapist and rehabilitator) elaborates the content: Knowledge, Weight control, Doing the right exercise, Dealing with the disease
2. Engagement of the target group: "La Caixa" Banking Foundation is supporting this study by giving access to its 63 senior centers in Catalonia (Spain)
3. Selection of senior centers: The educational program is planned to be run in 6 centers. Currently, 20 centers are conducting initial presentations to evaluate interest and ensure the selection of 6 final centers
4. Enrollment of smart seniors: 12 people will be selected (2 per center), called hereafter, "smart patients", through a survey so we can assess interest of enrolling and quality of the presentation

Stage II. Training and implementation:

5. Training of smart patients: Train selected smart patients during 9 sessions, 90 minutes each
6. Training groups of patients: Every smart patient will train 2 groups of 10 people also interested in joint health. A nurse will be in every session, giving support only if necessary
7. Evaluation and follow-up: Improvement of participants in the course will be assessed (anticipated sample size 240 people) by surveying level of satisfaction

(ARTS questionnaire), improvement of pain and functionality (WOMAC), improvement in perceived quality of life (EuroQuol 5), improvement of the degree of self-care to achieve a good management of the disease (IC, MPOC and TAC programs), improvement in therapeutic compliance

Results: Stage I initial presentations have been conducted at 8 out of 20 centers in urban and semi-rural areas to account for different social, economic, education and lifestyle demographics. Participants surveyed: 305; Interest in being a smart patient: 76; Interest in participating in the program: 193; No interest: 36; Level of satisfaction: >90% reporting good or very good.

Conclusions: Based on results to date, after the 20 sessions the team expects to collect 763 surveys and identify 190 potential smart patients and 483 people willing to participate in the program. There is a clear interest or concern for OA disease in elderly people and they want to take more responsibility for their disease and age with quality of life.

PARE0018 WE DO THE IMPOSSIBLE, BECAUSE THE POSSIBLE EVERYONE CAN DO WAD AWARENESS CAMPAIGN

H. Bankova, B. Ivkov, S. Bozhinova, B. Boteva. *BOPRD, Sofia, Bulgaria*

Background: One of the main priorities that Bulgarian organization for people with rheumatic diseases follows is dissemination of knowledge and information about RMD'S and their impact on people's life and to the society.

The WAD awareness campaign is the culmination of the organization's activities during the whole year.

Objectives: The main goal of the 2016 WAD awareness campaign was to:

- Inform the society and BOPRD's members about the social importance of RMD's.
- To inform BOPRD's members what are their rights as people with long term chronic condition.
- To inform the society about RMD's and the challenges that people with RMD's face.
- To challenge the people with RMD's to look into their inner world and to define what are their strengths and weaknesses.
- To make the informing process more attractive, by visualizing the key features of life with an RMD.

Methods: In 2016 BOPRD organized an awareness campaign - "We do the impossible, because the possible everyone can do"

The start of our campaign was on 1st of October and lasted for more than two weeks till the World arthritis day and ended on 16th of October. Informative and motivating pictures, with information about different RMD's, were published every day on the official BOPRD's Facebook page and were shared in the closed group for people with rheumatic diseases as well.

A social experiment among the members of the organization was made. They were asked to explain what the disease means to them, like they are telling the story to a person who do not know anything about it.

The aim of this experiment was to identify the meaning and significance which people with rheumatic diseases give to their condition, as well as the basic problems result from the illness.

Based on the social experiment and analysis of 33 small biographical narratives 17 basic characteristics of the rheumatic diseases are identified. These characteristics form the problematic areas for people with RMD's and bases for their study.

The main characteristics are life with chronic pain, the process of disabling, life in continuous compliance with the environment and the high degree of uncertainty and ambiguity, imposed by chronic illness.

An e-booklet, containing the results of the social experiment was published on BOPRD's Facebook page and website on 12th October. On the same day we published the WAD video, of the PARE WAD campaign: "The future is in your hands".

At the end of the awareness campaign we published an online booklet, which contained translated articles about RMD's and the different aspects of life with a chronic condition.

Results:

- The total number of all publications is 22.
- The publications were seen from over 3 000 people.
- The WAD video was seen by 1000 people.
- The results of the social experiment were seen by 1500 people.
- The most popular were those pictures that managed to touch people's feelings.

Conclusions: Main common characteristics of rheumatic diseases were identified and can help patients in getting the right diagnosis.

The most popular were the posts that were related to emotions and experience of life with a chronic condition.

By publishing the results of the social experiment we managed to help those who read the narratives get the feeling that they are not alone.

The results of the social experiment will be used as a basis in developing a manual for the main symptoms of RMD's (the patient perspective)

PARE0019 ADHERENCE TO THERAPY: A COMPARISON BETWEEN THREE PATIENTS POPULATIONS WITH AUTOIMMUNE INFLAMMATORY DISEASES

U.G. Viora[1], R. Giannelli[2], M.G. Pisu[3], G. Voltan[4] on behalf of ANMAR Italia.
[1]Anmar Italia, Torino; [2]Anmar Italia, Firenze; [3]Anmar Italia, Milano; [4]Anmar Italia, Roma, Italy

Background: Non-adherence to therapy is one of the main obstacles achieving the goals of care in chronic autoimmune inflammatory diseases, including Rheumatic diseases (RMDs). In the " MOSAICO" study, ANMAR along with two other associations of Italian patients (AMICI chronic inflammatory bowel diseases (IBD) and ANAP - psoriasis (PSO) and chronic dermatological diseases) wanted to compare the adherence to therapies for IBD, RMDs and PSO and identify key problems that can affect it positively or negatively. This paper presents the results related to adherence to treatment, the obstacles that are disadvantageous and to the factors that, conversely, favor adherence and persistence.

Objectives: to fix the degree of adherence to therapy - with DMARDs and biological indifferently - in the three different pathologies; to identify obstacles and factors predisposing good adherence and persistence by patients; to compare the three different populations, highlighting similarities and significant differences

Methods: a 72 questions questionnaire - about 50% of which were dedicated to adherence and persistence to therapy and the predisposing factors and impediments - prepared in collaboration with Doxapharma was administered to patients with RMDS, IBD, PSO via web and by volunteers of the three associations. The evaluation of adherence to therapy ("degree in which a person's behavior in taking medication, following a diet and/or change the lifestyle, corresponds to the specific recommendations made in agreement with the Medical") was assessed by Morisky Medication Adherence Scale - 8 items (MMAS-8)

Results: 1.017 patients - 233 with RMDs (AR e SA), 449 with IBD (Crohn and ulcerative colitis), 273 with PSO and 62 APs –answered to the questionnaire useful for the purpose of the study.

Non-adherence varies in a range from 50% of dermatological patients, to 44% of them with IBDs, to 40% of patients with APs, to 36% of them with RMDs. Only 74.8% of adherent people is persistent (83% in biologic therapy; 76% in DMARDS) and non-persistent patients does not ask and/or inform their doctors.

Patients with Psoriasis take therapies more discontinuously and inaccurately then all the others.

Promote adherence:

- good support from doctors and health professionals
- satisfaciton with information received
- the best QOL
- easiness and lack of problems in taking drugs
- satisfaction with the therapy
- biologic therapies (even for the best QoL ensured)

Promote discontinuity and non-adherence:

- dissatisfaction with the relationship with doctors and health professionals (33% ÷ 70% of patients is dissatisfied)

Conclusions: Our study shows that patients who enjoy a better health state, both physically and psychologically, are more likely to follow the treatment prescribed by their doctor, according to the mode and the specified time, especially if properly informed and well supported in choices, shared by medical and health professional staff.

THURSDAY, 15 JUNE TO SATURDAY, 17 JUNE 2017

Building patient led organisations

PARE0020 25 YEARS OF PATIENTS' ASSOCIATIONS OF ANKYLOSING SPONDYLITIS IN SPAIN: ACEADE

J.L. Garrido-Castro[1], C. Gonzalez-Navas[2], J. De La Haza[1], P. Plazuelo[3], E. Collantes-Estevez[4]. *[1]ACEADE. AS Patient Association of Cordoba; [2]CEADE. National Coordinator of AS Patient Associations, Cordoba; [3]CEADE. National Coordinator of AS Patient Associations, Madrid; [4]Reina Sofia University Hospital, Cordoba, Spain*

Background: Patients' associations can provide to the ankylosing spondylitis (AS) patient all the information and support that his/her rheumatologist cannot give and that is necessary to fight against the disease having a greater quality of life (1). Patients' and families' knowledge about AS is fundamental and Patients' associations play an important role in education on disease (2). In 1991, the first association dedicated to AS in Spain, was born: ACEADE (Asociacion Cordobesa de Enfermos Afectados de Espondilitis). The Rheumatologist, Dr Eduardo Collantes, after having spent some years in several countries, brings together several patients affected by this disease, in the city of Cordoba, to create the first Patients Association dedicated to this disease in Spain. There were some associations of this kind in the UK and France, and they decided to create their own association to promote the knowledge about AS and to help the AS patients. 25 years later, there are many AS patient associations in Spain that were created following the example of ACEADE, and with the help of this pioneering association.
Objectives: The aims of ACEADE during these 25 years has been:
1) Disseminate the knowledge of the disease.
2) Collaborate with medical researchers.
3) Improve the quality of life of the AS patient.
4) Organize and participate in scientific meetings, congresses and specialized courses.
5) Advise the patients in socio-labor aspects.
6) Inform associates of the advances related to the disease.
Methods: Several activities are being carried out in the Association, some of them were exposed previously (3): educational seminars, rehabilitation courses, patient guides, social events, legal advice, employment bureau, newsletter, web page, ... In order to develop these activities, we have several sources for fundraising: donations, local and regional governments, pharmaceuticals, foundations, ...
Results: ACEADE is formed by 415 members distributed in the province of Cordoba (Spain), although some of them are from outside this city (11%). 67% of them are men and the average age of the members is 53 years. Of these, 32% have a recognized legal disability. After ACEADE, up to 18 patient associations have been created in Spain. There is also a national organization of AS patient associations: CEADE.
Conclusions: ACEADE was the pioneering AS Association in Spain and has been the "mother" of others that have been appearing. Today there are associations of AS in virtually all territories of Spain, helping patients to have a better quality of life. The next 25 years appear, for our association, full of illusions, ideas and a lot of work ahead, to help in the fight against AS.

PARE0021 PUBLIC AND PATIENT INVOLVEMENT AT ARTHRITIS RESEARCH UK: ENSURING BENEFIT FOR ALL

C. Macdonald. *Arthritis Research UK, London, United Kingdom*

Background: Since 2008, Arthritis Research UK have utilised the valuable experience and perspective of people with arthritis to review and evaluate the research applications we receive, through the USER stakeholder committee. The world of public and patient involvement (PPI) has developed and progressed hugely in that time. So too has Arthritis Research UK, becoming an insight-led charity that can now genuinely say that people with arthritis are at the centre of everything we do, helping those people to be in control, independent and recognised. As such, our approach to PPI must not only meet the new high standards of meaningful PPI set by the research community but also serve to anchor our research activities and the work that we fund in genuine relevance and patient benefit.
Objectives: To present our new approach to involving people with arthritis in the decision-making processes of research and the wider charity.
Methods: We carried out a UK-wide scoping exercise, consisting of questionnaires and one-to-one interviews, of key stakeholder groups and PPI leaders. This included: our funded researchers and centres of excellence; medical research charities; and people with arthritis including ex- and current USER members. The findings were written up in to a report.
Results: The findings of the report highlighted to us that we need to 1) scale up our PPI activities in order to ensure that insight of people with arthritis can be integrated at all stages of the research cycle 2) improve the quality of our PPI ensuring that all the things we do are carried out with clear purpose, that they are meaningful and add mutual value to all involved 3) increase the numbers of people with arthritis in our PPI group to help realise this vision, whilst improving our support, training and guidance processes for those people 4) recognise and support the already excellent PPI activities going on in the musculoskeletal community, and providing resources and training for those also wishing to start or improve PPI activities.
Conclusions: After implementing this new approach for over a 18 months, we are now confident that our research activities and the research we fund, have the utmost relevance and potential benefit to people with arthritis.

PARE0022 ORGANIZATION OF GROUP EXERCISE THERAPY (GET) FOR PATIENTS WITH AXIAL SPONDYLOARTRITIS (AXSPA) IN THE NETHERLANDS; A NATIONWIDE SURVEY

F. Van Der Giesen[1,2], S. Van Weelij[1], N. Lopuhaa[3], T. Vliet Vlieland[1]. *[1]Orthopedics, Leiden University Medical Center, Leiden; [2]Rheumatology, Haga Teaching Hospital, The Hague; [3]Dutch Arthritis Foundation, Amsterdam, Netherlands*

Background: Exercise therapy is recommended for people with axSpA [1]. In the Netherlands GET specifically for patients with axSpA is usually organized by local rheumatology patient organizations. New scientific insights into the delivery of GET have emerged over the past years and structural reimbursement from the basic health insurance was terminated. To ensure the quality and continuity of the delivery of GET it is necessary first to determine their current structure and processes.
Objectives: To describe the structure and processes of group exercise therapy specifically for patients with axSpA in the Netherlands.
Methods: Using the database of the Dutch Arthritis Foundation in 2016 a pen-and-paper questionnaire was sent to the coordinators of all 82 local patient organizations who could potentially be involved in the delivery of AxSpA GET. The questionnaire comprised 18 questions on the numbers of groups and participating patients, organizational and financial responsibilities, recruitment methods for participants and supervisors, the type of exercise therapy provided (land based, hydrotherapy or a combination of both) and the perceived threats for future continuation.
Results: The questionnaire was returned by 66 of the 82 coordinators of whom17 stated their organization was involved in the delivery of axSpA specific GET (45 group therapy classes: 1 only land exercises; 13 only hydrotherapy; 31 combination) for 496 patients (estimated number of patients with axSpA in the Netherlands in 2016: 61.200 [2]). 15/17 local patient organisations have organisational as well as financial responsibilities. The most often used recruitment methods for participants were: via the rheumatologist/rheumatology nurses (n=17), physical therapists (n=8), or advertisement in local patient organisations' own media (n=8). Recruitment of supervisors was most often done by asking around within their own network (n=14) or asking the leaving supervisor for replacement (n=8). Regular evaluation of the delivery of care with the supervisors and participants was performed by 10 and 12 local patient organizations, respectively. Three had an agreement with health insurance companies regarding reimbursement of GET. In 6 regions the number of participants had been declining over the past 5 years. The most mentioned threats for continuity by coordinators were financial difficulties (n=7) and recruiting participants (n=9).
Conclusions: 17 local rheumatology patient organizations involved in the delivery of GET specifically for patients with axSpA in the Netherlands were identified. The large majority played an active role in the organization and reimbursement and regular evaluation of care delivery was done by two-thirds of them. Future challenges are the recruitment of new participants and reimbursement. As only a small minority of AxSpA patients appears to take part in group exercise therapy, more insight into the needs and preferences among the larger population is needed.

Abstracts Accepted for Publication

Patient information and education

AB1250-PARE LOVE YOUR HEART – AN INTERACTIVE ON-LINE EDUCATION PROGRAMME TO ENABLE PEOPLE WITH RHEUMATOID ARTHRITIS TO ASSESS THEIR CARDIOVASCULAR RISK AND SET PERSONAL GOALS TO IMPROVE THEIR CARDIOVASCULAR HEALTH

H. John[1], A. Bosworth[2]. [1]*Rheumatology, The Dudley Group NHS Foundation Trust, Dudley;* [2]*CEO, National Rheumatoid Arthritis Society, Maidenhead, United Kingdom*

Background: Rheumatoid arthritis (RA) is associated with an increased risk of cardiovascular disease, akin to type 2 diabetes. However, screening for, management of, and education about co-morbidities is not always adequate and as a result, the co-morbid risks may be overlooked by the general public, some health professionals and policymakers alike. Dr. John originally developed and piloted a programme in group format in Dudley to educate RA patients about their cardiovascular risk and help them change their lifestyle to improve their health; it achieved promising results. The format however limited the number of people who could access it and NRAS wanted to make it as widely available as possible. The sad reality is that it is not unusual to meet someone with RA who does not realise that they are at an increased risk of heart disease, so they are far less likely to address factors such as smoking, weight and diet which are firmly within their control.
Objectives: Our aim was to create an engaging and interactive online programme to educate people with RA about heart disease and atherosclerosis. This programme should; explain in simple terms why they are at increased risk; include the opportunity to determine individual risk factors thereby allowing a QRISK2 score to be performed; provide a cognitive-behavioural framework to empower people to change their behaviours and achieve a healthier lifestyle, thereby reducing risk of premature death from heart disease.
Methods: The participant manual created for the group programme and working closely with Dr. John and other health professionals in Dudley (exercise physiologist, smoking cessation nurse, dietician, health psychologist) and patients who had attended the programme, we explored with our creative film production team the best way to adapt this to create a really engaging on-line experience which would allow participants to undertake the programme over time whilst working through the behaviour change goal-setting process. Two days of filming were done in Dudley and Maidenhead followed by a period of editing, additional recording and review. Beta testing of the programme will be conducted in February, piloting in March and launch anticipated for April 2017.
Results: Evaluation of both the programme and the potential to change health behaviours will be measured on completion of the programme and actual behaviour change will be measured at 6 months.
Quote from a patient who participated in the face to face programme: "*Before I did this programme I thought that I was doing pretty well in terms of diet and exercise but it showed me that there was a lot I wasn't aware of, that my knowledge of lifestyle factors wasn't adequate and I needed to do more to help myself. I found it a valuable and life-changing experience to do this programme.*"
Conclusions: We are very excited about the launch of this programme as it is an important new resource addressing the major co-morbidity which shortens the lives of those with RA. It is unique in that not only does it provide patient education, but it also provides a structure through which patient can change their behaviour. Furthermore, it also illustrates what can be achieved when patient-led charity organisations work alongside healthcare professionals; we are hugely excited by its potential.

AB1251-PARE THE NEEDS AND PRIORITIES OF YOUNG PEOPLE LIVING WITH RHEUMATIC AND MUSCULOSKELETAL DISEASES IN ITALY: A SUB-ANALYSIS OF THE PARE YOUTH RESEARCH PROJECT

U.G. Viora[1], S. Ostuzzi[2], A. Alunno[3,4] on behalf of ANMAR Italia - ANMAR Young - EULAR Young PARE. [1]*Anmar Italia, Torino;* [2]*ANMAR Young, Anmar Italia, Rome;* [3]*Rheumatology unit -depy. of Medicine, University of Perugia, Perugia, Italy;* [4]*Eular Young Pare, Zurich, Switzerland*

Background: In 2014 EULAR Young PARE conducted a research (PARE Youth Research) to gather information about how young people (aged 18–35) living with rheumatic and musculoskeletal diseases (RMDs) are organized in different European countries and to explore their specific needs, obstacles, preferences and priorities. The research was developed through a survey launched in countries with EULAR members organizations and a total of 2,329 validated responses from the target population were obtained. In 2015 ANMAR Young, Italian National Association for people with RMDs' (ANMAR) youth group, was born aimed to create a network of young people with RMDs living in this country.
Objectives: Taken the socio-economical and cultural differences across countries, as well as the need to tailor interventions, activities and projects of national youth groups accordingly, the purpose of this study was to map out specific insights about Italian young people living with RMDs.
Methods: Data from Italian responders to the survey of the PARE Youth Research Project survey were extrapolated and answers were encoded to be analyzed using SPSS 21.0 software. Descriptive statistics were calculated in the whole group as well in subgroups of subjects as needed.
Results: 81 young Italian people living with RMDs responded to the survey: 75 females and 6 males. The conditions reported most often are rheumatoid arthritis (36%), juvenile idiopathic arthritis (23%), ankylosing spondylitis (15%). The work on PARE Youth Research's Italian data shows some important insights, among which we highlight that 84% report a delay in their studies due to the rheumatic condition, 92% report that the condition has affected their ability to work; 90% report the impact of RMD on social life, 70% report an impact on sexual life and 83% on mental health. Focusing on mental health issues, we highlight that 69% express the need for psychological support while only 43% have the possibility to access psychological support. Although all patients reported that after being diagnosed with an RMD they have access to a rheumatologist for regular follow-up visits, an average 3-year diagnostic delay is reported.
Conclusions: The results from the analysis of Italian responders to the survey represent a crucial starting point to put in light the unmet needs of Italian young people living with RMDs. These findings will be of great help to develop a fruitful national network of young people with RMDs on one hand and a focused collaboration with patient representatives, physicians, and health professionals (HPs) on the other. We believe that the awareness of physicians and HPs working in the field of rheumatology about the needs and priorities of young people with RMDs will ensure a better management of the disease and therefore lead to the reduction of the RMD burden in this subgroup of patients.

Best practice campaigning

AB1252-PARE TO RAISE AWARENESS OF RHEUMATIC AND MUSCULOSKELETAL DISEASES AND TO PROVIDE THE OPPORTUNITY TO THE FINANCIALLY LESS ABLE TO RECEIVE TIMELY DIAGNOSIS AND INTERVENTION IN RMDS

A. Stara, R. Stara, K. Koutsogianni, J. Papadakis, M. Chatziioannou, L. Papadaki, M. Sfakianaki, M. Agapitou. *Arthritis Crete, Heraklion, Crete, Greece*

Background: The timely and accurate diagnosis in most rheumatic diseases is still a big issue for patients as the choice of the appropriate doctor's specialty is still at the discretion of the patient, mainly due to the poor organized health care services. Furthermore, the success of our campaign two years ago, when we gave the opportunity to people suspecting they might have an RMD but who could not afford a rheumatologist to be examined for free, prompted our organization to offer not only free consultations but free lab tests as well.
Objectives: To raise awareness of RMDs and at the same time to enable people of lower income who may have the early warning signs of rheumatic diseases to be examined by a rheumatologist and have lab tests done at no cost.
Methods: Firstly, we found a sponsor who embraced our initiative and was willing to cover the cost of the whole campaign. Secondly, we contacted various medical laboratories to give us low estimates on the RMD tests and then we chose to collaborate with the ones offering us the lowest prices. Then we came into contact with all the rheumatologists in all the prefectures of the island and asked them to offer consultations free of charge according to their availability. On WAD, 12 October, we erected four stands in four central locations of our island with our logo, a banner, informative leaflets and a large number of well-informed volunteers to answer queries. Prior to WAD we had promoted this special event in the mass and social media. A lot of people visited our stands, told us their problem and their signs and we wrote down the names and phone numbers of those we deemed needed a rheumatologist. As last time, there were people who had already been seeing a rheumatologist who wanted to take advantage

of this opportunity; we had to reject them as this was only available to people who had not been diagnosed previously. The following two days our office made an appointment for these people with a rheumatologist in their area. The doctors prescribed the necessary laboratory tests and gave a free voucher for the tests to those that needed them. The cost of the lab tests was covered by our association. Our office received a large number of calls from people who wanted to be tested and unfortunately, we could not accommodate all of them as our budget was limited.

Results: More than 267 people visited our stands and 209 people phoned our office asking to be tested. We made appointments for 123 people of whom 111 showed up for their appointments. The rheumatologists gave vouchers and prescribed lab tests for 89 of them. 12 rheumatologists volunteered their services gratis and more than 40 volunteers took part in the campaign.

Conclusions: People's awareness of RMDs is growing but there are still undiagnosed people due to financial constraints, inadequate health insurance coverage and lack of information. Since the demand for free testing is very high we will make every effort to be able to provide this opportunity to undiagnozed people again in the future!

AB1253-PARE KID'S GET ARTHRITIS TOO - EXPANSION OF TARGET GROUPS

M. Ekroth. *The Finnish Rheumatism Association, Helsinki, Finland*

Background: The Finnish Rheumatism Association is generally perceived as a very strong alliance of older people. However in Finland there are more than 2000 children and youth suffering JIA and around 250 new ones get diagnosis yearly. Children will have their whole lives ahead with rheumatic disease, so they and their families also need information, support and friends.

Objectives: Support children and families living with JIA in different ways
To provide the accurate and latest information on JIA
Get in touch with families, understand what their needs are, provide them with the correct information and promote their interests
Bring new energy into the families' challenging lives affected by illness
Build a supporting network for the families and increase mental well-being
Rejuvenate the brand of our association

Methods: Ordered international top photographer to photograph the JIA children and families. Created an entirely new high-quality imagery and expression to all Rheumatism Association children communications.
Created the "Puppana" bunny soft toy and the mascot costume.
Have the rheumatism-week campaign: Kids Get Arthritis Too: one week nation wide big radio campaign with a child's voice, a poster campaign in hospitals, our local associations and public spaces.
First aid packet with information of JIA, some toys, and the Puppana mascot. Packets were delivered to all Finnish hospitals, juvenile rheumatoid arthritis units. The rheumatologist gives a packet for a child who receives a diagnosis.
Introduced the action program of two annual nationwide large children's events Joy of Life.
New juvenile rheumatoid arthritis sites for children and families on our new website.
Support the activities of local associations directed for children and families.
Create a new web portal support activities "Reumanakanssa.fi".
International Trials Organisation) in co-operation. Translated into Finnish and added to the new websitewhere we built ABC for JIA.

Results: The brand of the Finnish Rheumatism Association has become more modern and wider.
People have experienced an eye opening campaign, the children suffer from rheumatism–arthritis can be a disease at all ages
Families with children have been reached more, they have joined our social media groups, the event attracted more than 250 children and their families, new families with children have joined the association, some of the local association has begun to organize groups of juvenile rheumatoid arthritis
Fund-raising, it was very easy to find sponsors for children activities and it also helped in common fundraising.
Children suffering from rheumatoid have experienced a positive campaign, it feels better when people's attitudes change, and no longer think that they're suffering from "a disease of the elderly".
Cooperation with arthritis professionals has intensified and improved. Their want to do more co-operation and they guide patients to more actively explore the Finnish Rheumatism Association activities.

Conclusions: Operation for JIA children and their families are needed.
Children's powerful vision of the activities have a positive impact on the brand and fundraising organization
The positivity of this type of cooperation with arthritis professionals to approximate intervals and supported by more co-operation
It's relatively easy to receive sponsor funds for the development of children's activities
Children and families inclusion will bring new energy and confidence in the future among local associations
